ipRangeCheck	Boolean	query	Optional . Check available IP address range in database.		5.1.0

API Response

Sample Response

```
{
  "available": true
}
```

Name	Type	Description	Starting Version
available	boolean	Whether the API is available.	0.6
reason	String	Reason	3.4
success	boolean	Whether the API succeeds.	0.6
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current	0.6

Name	Type	Description	Starting Version
		error. If no root error exists, this parameter is null.	

SDK Sample

Java SDK

```
CheckIpAvailabilityAction action = new CheckIpAvailabilityAction();
action.l3NetworkUuid = "44fc110c3d87326299b46975aacb1705";
action.ip = "192.168.10.100";
action.arpCheck = false;
action.ipRangeCheck = true;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CheckIpAvailabilityAction.Result res = action.call();
```

Python SDK

```
CheckIpAvailabilityAction action = CheckIpAvailabilityAction()
action.l3NetworkUuid = "44fc110c3d87326299b46975aacb1705"
action.ip = "192.168.10.100"
action.arpCheck = false
action.ipRangeCheck = true
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CheckIpAvailabilityAction.Result res = action.call()
```

5.3.3.14 GetIpAddressCapacity

API Request

URLs

```
GET zstack/v1/ip-capacity
```

Headers

```
Authorization: OAuth the-session-uuid s
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/ip-capacity?
ipRangeUuids=6bf57331ebe433389c6c230153ac5d8d&all=false
```

Request Parameters

Name	Type	Location	Description	Starting Version
zoneUuids	List	query	Optional. The zone UUIDs.	0.6
l3NetworkUuids	List	query	Optional. The L3 network UUIDs.	0.6
ipRangeUuids	List	query	Optional. The IP range UUIDs.	0.6
all	boolean	query	Optional. Global settings.	0.6
systemTags	List	query	Optional. The system tags.	0.6
userTags	List	query	Optional. The user tags.	0.6

API Response

Sample Response

```
{
  "totalCapacity": 20.0,
  "availableCapacity": 15.0,
  "usedIpAddressNumber": 5.0,
  "ipv4TotalCapacity": 0.0,
  "ipv4AvailableCapacity": 0.0,

ipv6AvailableCapacity	long	The available IPv6 address capacity.	3.10.0
ipv6UsedIpAddressNumber	long	The number of used IPv6 addresses.	3.10.0
resourceType	String	The type of the queried resources, such as the IP range, L3 network, and zone.	3.9.0
success	boolean	Whether the API succeeds.	0.6
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
capacityData	List	See capacityData .	3.9.0
error	ErrorCode	See error .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code	0.6

Name	Type	Description	Starting Version
		that specifies an error . For example, SYS.1000, HOST.1001.	
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#capacityData

Name	Type	Description	Starting Version
resourceUuid	String	The resource UUID.	3.9.0
totalCapacity	long	The total IP capacity.	3.9.0
availableCapacity	long	The available IP capacity.	3.9.0
usedIpAddressNumber	long	The number of used IP addresses.	3.9.0
ipv4TotalCapacity	long	The total IPv4 address capacity.	3.10.0
ipv4AvailableCapacity	long	The available IPv4 address capacity.	3.10.0
ipv4UsedIpAddressNumber	long	The used IPv4 address capacity.	3.10.0
ipv6TotalCapacity	long	The total IPv6 address capacity.	3.10.0

Name	Type	Description	Starting Version
ipv6AvailableCapacity	long	The available IPv6 address capacity.	3.10.0
ipv6UsedIpAddressNumber	long	The used IPv6 address capacity.	3.10.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

SDK Sample

Java SDK

```
GetIpAddressCapacityAction action = new GetIpAddressCapacityAction();
action.ipRangeUuids = asList("454d69e78a7849b487ce2266c64cc6e0");
action.all = false;
action.sessionId = "58287d81bc0d441cac85579ed46cb4dd";
```

```
GetIpAddressCapacityAction.Result res = action.call();
```

Python SDK

```
GetIpAddressCapacityAction action = GetIpAddressCapacityAction()
action.ipRangeUuids = [2ef2089aa3ba4929bfde743c9d1cb674]
action.all = false
action.sessionId = "349872e1c8ad445bbc0b024ac6ac0fbb"
GetIpAddressCapacityAction.Result res = action.call()
```

5.3.3.15 AddIpRange

API Request

URLs

```
POST zstack/v1/l3-networks/{l3NetworkUuid}/ip-ranges
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "Test-IP-Range",
    "startIp": "192.168.100.10",
    "endIp": "192.168.100.250",
    "netmask": "255.255.255.0",
    "gateway": "192.168.100.1",
    "ipRangeType": "Normal"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"name":"Test-IP-Range","startIp":"192.168.100.10","endIp":"192.168.100.250","netmask":"255.255.255.0","gateway":"192.168.100.1","ipRangeType":"Normal"},"systemTags":[],"userTags":[]}' \
http://localhost:8080/zstack/v1/l3-networks/acc0573590db3297814610cab774b60b/ip-ranges
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
l3NetworkUuid	String	url	The L3 network UUID.		0.6
name	String	body (contained in the params structure)	The L3 network name.		0.6
description	String	body (contained in the params structure)	Optional. The detailed description of the L3 network.		0.6
startIp	String	body (contained in the params structure)	The start IP address.		0.6
endIp	String	body (contained in the params structure)	The end IP address.		0.6
netmask	String	body (contained in the params structure)	The netmask.		0.6
gateway	String	body (contained in the params structure)	The gateway.		0.6
ipRangeType	String	body (contained in the params structure)	Optional. The IP range type.	• Normal • AddressPool	3.9.0
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID. If specified, the L3 network will use the		0.6

Name	Type	Location	Description	Optional Value	Starting Version
			specified value as UUID .		
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

**Note:**

- When you add an IP range in ZStack Cloud, you can specify the DHCP server address by adding the **DhcpServer** option to **SystemTags**.
 - Format of the **DhcpServer** option: `flatNetwork::DhcpServer::{%s}::ipUuid::{%s}`
 - Example: `flatNetwork::DhcpServer::192.168.1.100::ipUuid::null`

API Response

Sample Response

```
{
  "inventory": {

ipRangeType	IpRangeType	See ipRangeType .	3.9.0

#ipRangeType

Name	Type	Description	Starting Version
Normal	IpRangeType		3.9.0
AddressPool	IpRangeType		3.9.0

SDK Sample

Java SDK

```
AddIpRangeAction action = new AddIpRangeAction();
action.l3NetworkUuid = "acc0573590db3297814610cab774b60b";
action.name = "Test-IP-Range";
action.startIp = "192.168.100.10";
action.endIp = "192.168.100.250";
action.netmask = "255.255.255.0";
action.gateway = "192.168.100.1";
action.ipRangeType = "Normal";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
AddIpRangeAction.Result res = action.call();
```

Python SDK

```
AddIpRangeAction action = AddIpRangeAction()
action.l3NetworkUuid = "acc0573590db3297814610cab774b60b"
action.name = "Test-IP-Range"
action.startIp = "192.168.100.10"
action.endIp = "192.168.100.250"
action.netmask = "255.255.255.0"
action.gateway = "192.168.100.1"
action.ipRangeType = "Normal"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
AddIpRangeAction.Result res = action.call()
```

5.3.3.16 DeleteIpRange

API Request

URLs

```
DELETE/v1/l3-networks/ip-ranges/{uuid}?deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 1872261fb9824d9f9dd73a991cf05a44" \
-X DELETE http://localhost:8080/zstack/v1/l3-networks/ip-ranges/
a2a9f85d22914afe95a195b63143830d?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The UUID of the IP range.		0.6
deleteMode	String	body	Optional. The delete mode.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DeleteIpRangeAction action = new DeleteIpRangeAction();
action.uuid = "6d1f44d0fe1440189eb293f18d7bf682";
action.deleteMode = "Permissive";
action.sessionId = "4a3745cb42f5430f874c6f6c4b298e95";
DeleteIpRangeAction.Result res = action.call();
```

Python SDK

```
DeleteIpRangeAction action = DeleteIpRangeAction()
action.uuid = "0f1fcf2e779543baa416deb89eeeb2db"
action.deleteMode = "Permissive"
action.sessionId = "d07fb42a181d43dda2b6992536b02804"
DeleteIpRangeAction.Result res = action.call()
```

5.3.3.17 QueryIpRange

API Request

URLs

```
GET zstack/v1/l3-networks/ip-ranges
GET /v1/l3-networks/ip-ranges/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 8f7b1e0396c54646a4b37affdfdda079" \
-X GET http://localhost:8080/zstack/v1/l3-networks/ip-ranges?
q=uuid=887227aa5d5c49e2a8137b79dad3738a
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 60a5dfda1a9843809415eb28f2550f94" \
-X GET http://localhost:8080/zstack/v1/l3-networks/ip-
ranges/17684784fcc04571a47eb24dc2eb9638
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryIpRange**, and pressing the **Tab** key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "l3NetworkUuid": "9a72daf0034443aa81864e593f0f5b32",
      "name": "Test-IPRange",
      "networkCidr": "192.168.10.0/24"
    }
  ]
}
```

Name	Type	Description	Starting Version

SDK Sample

Java SDK

```
UpdateIpRangeAction action = new UpdateIpRangeAction();
action.uuid = "97054a54a1fc4b49ba3d7a5d44b9e385";
action.sessionId = "8644fd2755f148359edff9521b27868b";
UpdateIpRangeAction.Result res = action.call();
```

Python SDK

```
UpdateIpRangeAction action = UpdateIpRangeAction()
action.uuid = "2b4499297735445482dc994113574b41"
action.sessionId = "0a16c9ea3e6e4ad9b1ff71a826b67277"
UpdateIpRangeAction.Result res = action.call()
```

5.3.3.19 AddIpRangeByNetworkCidr

API Request

URLs

```
POST zstack/v1/l3-networks/{l3NetworkUuid}/ip-ranges/by-cidr
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "Test-IPRange",
    "networkCidr": "192.168.10.0/24",
    "ipRangeType": "Normal"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"name":"Test-IPRange","networkCidr":"192.168.10.0/24","ipRangeType":"Normal"}}'
http://localhost:8080/zstack/v1/l3-networks/c186887bc5e43da7ba42bd5d66eba0cd/ip-ranges/by-cidr
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The L3 network name.		0.6
description	String	body (contained in the params structure)	Optional. The detailed description of the L3 network.		0.6
l3NetworkUuid	String	url	The L3 network UUID.		0.6
networkCidr	String	body (contained in the params structure)	The network CIDR.		0.6
gateway	String	body (contained in the params structure)	Optional. The gateway.		3.7.0
ipRangeType	String	body (contained in the params structure)	Optional. The IP range type.	- Normal - AddressPool	3.9.0
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID. If specified, the L3 network will use the		0.6

Name	Type	Location	Description	Optional Value	Starting Version
			specified value as UUID .		
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

**Note:**

- When you add an IP range by specifying a network CIDR in ZStack Cloud, you can specify the DHCP server address by adding the **affinityGroup** option to **SystemTags**.
 - Format of the **affinityGroup** option: `flatNetwork::DhcpServer::{%s}::ipUuid::%s`
 - Example: `flatNetwork::DhcpServer::192.168.1.100::ipUuid::null`

API Response

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
l3NetworkUuid	String	url	The L3 network UUID.		2.1
systemTags	List	query	Optional. The system tags.		2.1
userTags	List	query	Optional. The user tags.		2.1

API Response

Sample Response

```
{
  "mtu": 9216.0
}
```

Name	Type	Description	Starting Version
mtu	Integer		2.1
success	boolean		2.1
error	ErrorCode	The error code. If not null, the operation	2.1

Name	Type	Description	Starting Version
		fails, or vice versa. For more information, see error .	
error	ErrorCode	See error .	2.1

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	2.1
description	String	The brief description of the error.	2.1
details	String	The details about the error.	2.1
elaboration	String	The reserved field. Default value: null.	2.1
opaque	LinkedHashMap	The reserved field. Default value: null.	2.1
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	2.1

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	2.1

Name	Type	Description	Starting Version
description	String	The brief description of the error.	2.1
details	String	The details about the error.	2.1
elaboration	String	The reserved field. Default value: null.	2.1
opaque	LinkedHashMap	The reserved field. Default value: null.	2.1
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	2.1

SDK Sample

Java SDK

```
GetL3NetworkMtuAction action = new GetL3NetworkMtuAction();  
action.l3NetworkUuid = "fd8d572d777d4383b201ddfce629d50e";  
action.sessionId = "0cc5202de3ce4881a305e5fa1d431aaa";  
GetL3NetworkMtuAction.Result res = action.call();
```

Python SDK

```
GetL3NetworkMtuAction action = GetL3NetworkMtuAction()  
action.l3NetworkUuid = "7615cfd154a048dcab07a1114ee6205d"  
action.sessionId = "d0f3cf05a49345438a92108d2fd86cfe"
```

```
GetL3NetworkMtuAction.Result res = action.call()
```

5.3.3.21 SetL3NetworkMtu

API Request

URLs

```
POST zstack/v1/l3-networks/{l3NetworkUuid}/mtu
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "mtu": 9216.0
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"mtu":9216.0}}' \
http://localhost:8080/zstack/v1/l3-networks/817672c1bb903264a9a41c34332c3145/mtu
```

Request

Name	Type	Location	Description	Optional Value	Starting Version
l3NetworkUuid	String	url	The L3 network UUID.		2.1
mtu	Integer	body (contained in the params structure)			2.1

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	body	Optional. The system tags.		2.1
userTags	List	body	Optional. The user tags.		2.1

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
SetL3NetworkMtuAction action = new SetL3NetworkMtuAction();
action.l3NetworkUuid = "b19ce058b0f54c6d83c14078c0079c2c";
action.mtu = 9216.0;
action.sessionId = "b441c616886c4183a51ba044e35c7d66";
SetL3NetworkMtuAction.Result res = action.call();
```

Python SDK

```
SetL3NetworkMtuAction action = SetL3NetworkMtuAction()
action.l3NetworkUuid = "67dc01887dfc4142aabe4221675c1b98"
action.mtu = 9216.0
action.sessionId = "d5188e0801994e3a9dfb3d3ebc2f7a39"
```

```
SetL3NetworkMtuAction.Result res = action.call()
```

5.3.3.22 GetL3NetworkRouterInterfaceIp

API Request

URLs

```
GET zstack/v1/l3-networks/{l3NetworkUuid}/router-interface-ip
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/l3-
networks/71aa55703e063d9db0f13fa0b285a82b/router-interface-ip
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
l3NetworkUuid	String	url	The L3 network UUID.		2.2
systemTags	List	query	Optional. The system tags.		2.2
userTags	List	query	Optional. The user tags.		2.2

API Response

Sample Response

```
{
  "routerInterfaceIp": "192.168.0.2"
}
```

Name	Type	Description	Starting Version
routerInterfaceIp	String	The IP address of the router on the L3 network. This parameter is valid only when a vRouter is	2.2

Name	Type	Description	Starting Version
		created on a common L3 network, or a VPC vRouter is attached to a VPC network.	
success	boolean		2.2
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.2

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

SDK Sample

Java SDK

```
GetL3NetworkRouterInterfaceIpAction action = new GetL3NetworkRouterInterfaceIpAction();
action.l3NetworkUuid = "23453c09a0f534d5bb10a3267c09aac8";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetL3NetworkRouterInterfaceIpAction.Result res = action.call();
```

Python SDK

```
GetL3NetworkRouterInterfaceIpAction action = GetL3NetworkRouterInterfaceIpAction()
action.l3NetworkUuid = "5cece4a676083f6fa3491a068e3e34e6"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetL3NetworkRouterInterfaceIpAction.Result res = action.call()
```

5.3.3.23 SetL3NetworkRouterInterfaceIp

API Request

URLs

```
POST zstack/v1/l3-networks/{l3NetworkUuid}/router-interface-ip
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "routerInterfaceIp": "192.168.10.2"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"routerInterfaceIp":"192.168.10.2"}}' \
```

```
http://localhost:8080/zstack/v1/l3-
networks/40124528890f368c8752825634144fd5/router-interface-ip
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
l3NetworkUuid	String	url	The L3 network UUID.		2.1
routerInterfaceIp	String	body (contained in the params structure)			2.1
systemTags	List	body	Optional. The system tags.		2.1
userTags	List	body	Optional. The user tags.		2.1

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
SetL3NetworkRouterInterfaceIpAction action = new SetL3NetworkRouterInterfaceIpAction();
action.l3NetworkUuid = "00ab12382f544de0ac71b48afe7ecd9c";
action.routerInterfaceIp = "192.168.10.2";
action.sessionId = "279a26540d254f42b7a2320652e6c64b";
SetL3NetworkRouterInterfaceIpAction.Result res = action.call();
```

Python SDK

```
SetL3NetworkRouterInterfaceIpAction action = SetL3NetworkRouterInterfaceIpAction()
action.l3NetworkUuid = "3558f265c4204eae93104e3ffa974661"
action.routerInterfaceIp = "192.168.10.2"
action.sessionId = "97c0fdecc551496d86b8861f045df21a"
```

```
SetL3NetworkRouterInterfaceIpAction.Result res = action.call()
```

5.3.3.24 AddIpv6Range

API Request

URLs

```
POST zstack/v1/l3-networks/{l3NetworkUuid}/ipv6-ranges
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "Test-IP-Range",
    "startIp": "2002:2001::02",
    "endIp": "2002:2001::FE",
    "gateway": "2002:2001::01",
    "prefixLen": 64,
    "addressMode": "Stateful-DHCP"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"name":"Test-IP-Range","startIp":"2002:2001::02","endIp":"2002:2001::FE","gateway":"2002:2001::01","prefixLen":64,"addressMode":"Stateful-DHCP"},"systemTags":[],"userTags":[]}' http://localhost:8080/zstack/v1/l3-networks/b6f82aa00c3f37adba4b349eb427db80/ipv6-ranges
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
l3NetworkUuid	String	url	The L3 network UUID.		3.1.0

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The L3 network name.		3.1.0
description	String	body (contained in the params structure)	The detailed description of the L3 network .		3.1.0
startIp	String	body (contained in the params structure)	The start IP address.		3.1.0
endIp	String	body (contained in the params structure)	The end IP address.		3.1.0
gateway	String	body (contained in the params structure)	The gateway.		3.1.0
prefixLen	Integer	body (contained in the params structure)	The prefix length.		3.1.0
addressMode	String	body (contained in the params structure)	The allocation mode of the IPv6 address.	• SLAAC • Stateful-DHCP • Stateless-DHCP	3.1.0
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID. If specified, the L3 network will use the specified		3.1.0

Name	Type	Location	Description	Optional Value	Starting Version
			value as UUID .		
systemTags	List	body	Optional. The system tags.		3.1.0
userTags	List	body	Optional. The user tags.		3.1.0

**Note:**

- When you add an IPv6 range in ZStack Cloud, you can specify the DHCP server address by adding the **affinityGroup** option to **SystemTags**.
 - Format of the **affinityGroup** option: `flatNetwork::DhcpServer::{%s}::ipUuid::{%s}`
 - Example: `flatNetwork::DhcpServer::192.168.1.100::ipUuid::null`

```

5.3.3.25 AddIpv6RangeByNetworkCidr

API Request

URLs

```
POST zstack/v1/l3-networks/{l3NetworkUuid}/ipv6-ranges/by-cidr
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "Test-IPRange",
    "networkCidr": "2002:2001::/64",
    "addressMode": "SLAAC"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"name":"Test-IPRange","networkCidr":"2002:2001::/64","addressMode":"SLAAC"}}'
http://localhost:8080/zstack/v1/l3-networks/92850b5a66633e2aa8c3a8ae6ebb541d/ipv6-ranges/by-cidr
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The L3 network name.		3.1.0

Name	Type	Location	Description	Optional Value	Starting Version
description	String	body (contained in the params structure)	Optional. The detailed description of the L3 network.		3.1.0
l3NetworkUuid	String	url	The L3 network UUID.		3.1.0
networkCidr	String	body (contained in the params structure)	The network CIDR.		3.1.0
addressMode	String	body (contained in the params structure)	The allocation mode of the IPv6 address.	• SLAAC • Stateful-DHCP • Stateless-DHCP	3.1.0
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID. If specified, the L3 network will use the specified value as UUID.		3.1.0
systemTags	List	body	Optional. The system tags.		3.1.0
userTags	List	body	Optional. The user tags.		3.1.0

**Note:**

- When you add an IPv6 range by specifying a network CIDR in ZStack Cloud, you can specify the DHCP server address by adding the **affinityGroup** option to **SystemTags**.
 - Format of the **affinityGroup** option: `flatNetwork::DhcpServer::{%s}::ipUuid::{%s}`

- Example: flatNetwork::DhcpServer::192.168.1.100::ipUuid::null

uuid	String	The resource UUID.	3.1.0
l3NetworkUuid	String	The L3 network UUID.	3.1.0
name	String	The resource name.	3.1.0
description	String	The detailed description of the resource.	3.1.0
startIp	String		3.1.0
endIp	String		3.1.0
netmask	String		3.1.0
prefixLen	String	The prefix length.	3.1.0
gateway	String		3.1.0
networkCidr	String		3.1.0
ipVersion	Integer	The IP version.	3.1.0
addressMode	String	The allocation mode of the IPv6 address.	3.1.0
createDate	Timestamp	The creation date.	3.1.0
lastOpDate	Timestamp	The last operation date.	3.1.0

SDK Sample

Java SDK

```
AddIpv6RangeByNetworkCidrAction action = new AddIpv6RangeByNetworkCidrAction();
action.name = "Test-IPRange";
action.l3NetworkUuid = "92850b5a66633e2aa8c3a8ae6ebb541d";
action.networkCidr = "2002:2001::/64";
action.addressMode = "SLAAC";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
AddIpv6RangeByNetworkCidrAction.Result res = action.call();
```

Python SDK

```
AddIpv6RangeByNetworkCidrAction action = AddIpv6RangeByNetworkCidrAction()
action.name = "Test-IPRange"
action.l3NetworkUuid = "92850b5a66633e2aa8c3a8ae6ebb541d"
action.networkCidr = "2002:2001::/64"
action.addressMode = "SLAAC"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
AddIpv6RangeByNetworkCidrAction.Result res = action.call()
```

5.3.3.26 QueryIpAddress

API Request

URLs

```
GET zstack/v1/l3-networks/ip-address
GET zstack/v1/l3-networks/ip-address{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/l3-networks/ip-address
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/l3-networks/ip-address/87b2ab50f6c13ebb9dd73ca46bb22bc7
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryIpAddress`, and pressing the **Tab** key.

API Response

Sample Response

```
{
  "inventories": [
    {

  }
]
}

```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.1.0
inventories	List	See inventories .	3.1.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.1.0
description	String	The brief description of the error.	3.1.0
details	String	The details about the error.	3.1.0
elaboration	String	The reserved field. Default value: null.	3.1.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.1.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.1.0

#inventories

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.1.0
ipRangeUuid	String	The IP range UUID.	3.1.0
l3NetworkUuid	String	The L3 network UUID.	3.1.0
ipVersion	Integer	The IP version.	3.1.0
ip	String	The IP address.	3.1.0
netmask	String	The netmask.	3.1.0
gateway	String	The gateway.	3.1.0
usedFor	String		3.1.0
ipInLong	long		3.1.0
vmNicUuid	String	The VM NIC UUID.	3.1.0
createDate	Timestamp	The creation date.	3.1.0
lastOpDate	Timestamp	The last operation date.	3.1.0

SDK Sample

Java SDK

```
QueryIpAddressAction action = new QueryIpAddressAction();
action.conditions = asList();
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryIpAddressAction.Result res = action.call();
```

Python SDK

```
QueryIpAddressAction action = QueryIpAddressAction()
action.conditions = []
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
QueryIpAddressAction.Result res = action.call()
```

5.3.3.27 GetL3NetworkIpStatistic

API Request

URLs

```
GET zstack/v1/l3-networks/{l3NetworkUuid}/ip-statistic
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/l3-
networks/9bdd769f3e603f65bd368512ebe8b998/ip-statistic?
resourceType=All&sortBy=Ip&sortDirection=asc&start=0.0&limit=20.0&replyWithCount=
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
l3NetworkUuid	String	url	The L3 network UUID.		3.7.0
resourceType	String	query	Optional. The resource type.	- All - Vip - VM	3.7.0
ip	String	query	Optional. The specified IP address.		3.7.0
sortBy	String	query	Optional. The sort method.	- Ip - CreateDate	3.7.0
sortDirection	String	query	Optional. The sort direction.	- asc - desc	3.7.0
start	Integer	query	Optional. The location where the statistics starts.		3.7.0

Name	Type	Location	Description	Optional Value	Starting Version
limit	Integer	query	Optional. The count of the statistics.		3.7.0
replyWithCount	boolean	query	Optional. Whether to return both the statistics result and count.		3.7.0
systemTags	List	query	Optional. The system tags.		3.7.0
userTags	List	query	Optional. The user tags.		3.7.0

API Response

Sample Response

```
{
  "ipStatistics": [
    {
      "ip": "192.168.0.1",
      "resourceTypes": [
        "Other"
      ]
    }
  ],
  "total": 1.0
}
```

Name	Type	Description	Starting Version
total	Long	The total statistics of the IP addresses.	3.7.0
success	boolean	Whether the API succeeds.	3.7.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.7.0
ipStatistics	List	See ipStatistics .	3.7.0

Name	Type	Description	Starting Version
error	ErrorCode	See error .	3.7.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.7.0
description	String	The brief description of the error.	3.7.0
details	String	The details about the error.	3.7.0
elaboration	String	The reserved field. Default value: null.	3.7.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.7.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.7.0

#ipStatistics

Name	Type	Description	Starting Version
ip	String	The IP address.	3.7.0
vipUuid	String	The VIP UUID.	3.7.0
vipName	String	The VIP name.	3.7.0
vmInstanceUuid	String	The VM instance UUID.	3.7.0
vmInstanceName	String	The VM instance name.	3.7.0
vmInstanceType	String	The VM instance type.	3.7.0

Name	Type	Description	Starting Version
vmDefaultIp	String	The default IP address of the VM instance.	3.7.0
resourceTypes	List	The types of resources to which the IP address binds.	3.7.0
state	String	The resource state.	3.7.0
useFor	String	The network service to which the IP address binds.	3.7.0
createDate	Timestamp	The creation date.	3.7.0
ownerName	String	The name of the resource owner.	3.7.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.7.0
description	String	The brief description of the error.	3.7.0
details	String	The details about the error.	3.7.0
elaboration	String	The reserved field. Default value: null.	3.7.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.7.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.7.0

SDK Sample

Java SDK

```

GetL3NetworkIpStatisticAction action = new GetL3NetworkIpStatisticAction();
action.l3NetworkUuid = "9bdd769f3e603f65bd368512ebe8b998";
action.resourceType = "All";
action.sortBy = "Ip";
action.sortDirection = "asc";
action.start = 0.0;
action.limit = 20.0;
action.replyWithCount = false;

action.replyWithCount = false
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetL3NetworkIpStatisticAction.Result res = action.call()

```

5.3.3.28 QueryAddressPool

API Request

URLs

```
GET zstack/v1/l3-networks/address-pools
```

```
GET zstack/v1/l3-networks/address-pools/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/l3-networks/address-pools?
q=uuid=a73cf6bc10a0390bb5e461d9f5e3fd6d

```

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \

```

```
-X GET http://localhost:8080/zstack/v1/l3-networks/address-pools/  
f45cb0f9098336a39662b7553f42deb5
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryAddressPool**, and pressing the **Tab** key.

API Response

Sample Response

```
{  
  "inventories": [  
    {  
      "l3NetworkUuid": "81ce7828f3f63c0ea8a69dd9139bdaa0",  
      "name": "Test-IPRange",  
      "networkCidr": "192.168.10.0/24",  
      "ipRangeType": "AddressPool"  
    }  
  ]  
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.9.0
inventories	List	See inventories .	3.9.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.9.0
description	String	The brief description of the error.	3.9.0
details	String	The details about the error.	3.9.0

Name	Type	Description	Starting Version
elaboration	String	The reserved field. Default value: null.	3.9.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.9.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.9.0

#inventories

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.9.0
l3NetworkUuid	String	The L3 network UUID.	3.9.0
name	String	The resource name.	3.9.0
description	String	The detailed description of the resource.	3.9.0
startIp	String	The start IP address.	3.9.0
endIp	String	The end IP address.	3.9.0
netmask	String	The netmask.	3.9.0
gateway	String	The gateway.	3.9.0
networkCidr	String	The network CIDR.	3.9.0
ipVersion	Integer	The IP version.	3.9.0
addressMode	String	The allocation mode of the IPv6 address.	3.9.0
prefixLen	Integer	The prefix length.	3.9.0
createDate	Timestamp	The creation date.	3.9.0
lastOpDate	Timestamp	The last operation date.	3.9.0
ipRangeType	IpRangeType	See ipRangeType .	3.9.0

#ipRangeType

Name	Type	Description	Starting Version
Normal	IpRangeType	The normal IP range.	3.9.0
AddressPool	IpRangeType	The IP address pool.	3.9.0

SDK Sample

Java SDK

```
QueryAddressPoolAction action = new QueryAddressPoolAction();
action.conditions = asList("uuid=4cbab87c862032f1a161bebe7e1f55a1");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryAddressPoolAction.Result res = action.call();
```

Python SDK

```
QueryAddressPoolAction action = QueryAddressPoolAction()
action.conditions = ["uuid=455d45fad9893eba9565de38588c7416"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryAddressPoolAction.Result res = action.call()
```

5.3.3.29 AddReservedIpRange

API Request

URLs

```
POST zstack/v1/l3-networks/{l3NetworkUuid}/reserved-ip-ranges
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "startIp": "192.168.100.10",
    "endIp": "192.168.100.250"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"startIp": "192.168.100.10", "endIp": "192.168.100.250"}}' \
http://localhost:8080/zstack/v1/l3-networks/
dc9fb647bbd73a768da652b6cd100495/reserved-ip-ranges
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
l3NetworkUuid	String	url	The L3 network UUID.		5.1.0
startIp	String	body (contained in the params structure)	The start IP address.		5.1.0
endIp	String	body (contained in the params structure)	The end IP address.		5.1.0
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		5.1.0
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID.		5.1.0
systemTags	List	body	Optional. The system tags.		5.1.0
userTags	List	body	Optional. The user tags.		5.1.0

API Response

Sample Response

```
{
  "inventory": {
    "l3NetworkUuid": "9bb0926251903385928489eba7388cd4",
    "name": "Test-IP-Range",
```

```

    "startIp": "192.168.100.10",
    "endIp": "192.168.100.250"
  }
}

```

Name	Type	Description	Starting Version
success	boolean		5.1.0
inventory	ReservedIp RangeInventory	See inventory	5.1.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	5.1.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	5.1.0
l3NetworkUuid	String	The L3 network UUID.	5.1.0
name	String	The resource name.	5.1.0
description	String	The detail description of the resource.	5.1.0
startIp	String	The start IP address.	5.1.0
endIp	String	The end IP address.	5.1.0
ipVersion	Integer	The IP version.	5.1.0
createDate	Timestamp	The creation date.	5.1.0
lastOpDate	Timestamp	The last operation date.	5.1.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6

Name	Type	Description	Starting Version
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

SDK Sample

Java SDK

```
AddReservedIpRangeAction action = new AddReservedIpRangeAction();
action.l3NetworkUuid = "dc9fb647bbd73a768da652b6cd100495";
action.startIp = "192.168.100.10";
action.endIp = "192.168.100.250";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
AddReservedIpRangeAction.Result res = action.call();
```

Python SDK

```
AddReservedIpRangeAction action = AddReservedIpRangeAction()
action.l3NetworkUuid = "dc9fb647bbd73a768da652b6cd100495"
action.startIp = "192.168.100.10"
action.endIp = "192.168.100.250"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
AddReservedIpRangeAction.Result res = action.call()
```

5.3.3.30 DeleteReservedIpRange

API Request

URLs

```
DELETE zstack/v1/l3-networks/reserved-ip-ranges/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/l3-networks/reserved-ip-ranges/c01027fecc013c338e25d67581eed865
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		5.1.0
deleteMode	String	body	Optional. The delete mode . (Permissive / Enforcing, Permissive)		5.1.0
systemTags	List	body	Optional. The system tags.		5.1.0
userTags	List	body	Optional. The user tags.		5.1.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
}
```

SDK Sample

Java SDK

```
DeleteReservedIpRangeAction action = new DeleteReservedIpRangeAction
();
action.uuid = "c01027fecc013c338e25d67581eed865";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteReservedIpRangeAction.Result res = action.call();
```

Python SDK

```
DeleteReservedIpRangeAction action = DeleteReservedIpRangeAction()
action.uuid = "c01027fecc013c338e25d67581eed865"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteReservedIpRangeAction.Result res = action.call()
```

5.3.3.31 ChangeL3NetworkDhcpIpAddress

API Request

URLs

```
PUT zstack/v1/l3-networks/{l3NetworkUuid}/dhcp-ip
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeL3NetworkDhcpIpAddress": {
    "dhcpServerIp": "192.168.1.100",
    "dhcpv6ServerIp": "2024:04:28:01::100"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
```

```
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"changeL3NetworkDhcpIpAddress":
{"dhcpServerIp":"192.168.1.100", "dhcpv6ServerIp":"2024:04:28:01::100"}}'
http://localhost:8080/zstack/v1/l3-
networks/6b693b00316b30819bb30bfe0df10256/dhcp-ip
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
l3NetworkUuid	String	url	The L3 network UUID.		5.1.0
dhcpServerIp	String	body (contained in the changeL3NetworkDhcpIpAddress structure)	Optional. The IPv4 address of the DHCP server.		5.1.0
dhcpv6ServerIp	String	body (contained in the changeL3NetworkDhcpIpAddress structure)	Optional. The IPv6 address of the DHCP server.		5.1.0
systemTags	List	body	Optional. The system tags.		5.1.0
userTags	List	body	Optional. The user tags.		5.1.0

API Response

Sample Response

```
{
  "dhcpServerIp": "192.168.100.3",
  "dhcpv6ServerIp": "2024:04:28:01::100"
}
```

Name	Type	Description	Starting Version
dhcpServerIp	String		5.1.0
dhcpv6ServerIp	String		5.1.0

Name	Type	Description	Starting Version
success	boolean		5.1.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error	5.1.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

SDK Sample

Java SDK

```

ChangeL3NetworkDhcpIpAddressAction action = new ChangeL3NetworkDhcpIpAddressAction();
action.l3NetworkUuid = "6b693b00316b30819bb30bfe0df10256";
action.dhcpServerIp = "192.168.1.100";
action.dhcpv6ServerIp = "2024:04:28:01::100";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";

```

```
ChangeL3NetworkDhcpIpAddressAction.Result res = action.call();
```

Python SDK

```
ChangeL3NetworkDhcpIpAddressAction action = ChangeL3NetworkDhcpI
pAddressAction()
action.l3NetworkUuid = "6b693b00316b30819bb30bfe0df10256"
action.dhcpServerIp = "192.168.1.100"
action.dhcpv6ServerIp = "2024:04:28:01::100"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
ChangeL3NetworkDhcpIpAddressAction.Result res = action.call()
```

5.3.3.32 DeletelpAddress

API Request

URLs

```
DELETE zstack/v1/l3-networks/{l3NetworkUuid}/ip-address
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/l3-networks/
b6e5c225bf553bc8bd5a5fcf3fac9fa3/ip-address
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
l3NetworkUuid	String	url	The L3 network UUID.		5.1.0
usedIpUuids	List	body	The UUID of the deleted IP address.		5.1.0
deleteMode	String	body	Optional. The delete mode . (Permissive / Enforcing, Permissive)		5.1.0
systemTags	List	body	Optional. The system tags.		5.1.0

Name	Type	Location	Description	Optional Value	Starting Version
userTags	List	body	Optional. The user tags.		5.1.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteIpAddressAction action = new DeleteIpAddressAction();
action.l3NetworkUuid = "b6e5c225bf553bc8bd5a5fcf3fac9fa3";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteIpAddressAction.Result res = action.call();
```

Python SDK

```
DeleteIpAddressAction action = DeleteIpAddressAction()
action.l3NetworkUuid = "b6e5c225bf553bc8bd5a5fcf3fac9fa3"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
DeleteIpAddressAction.Result res = action.call()
```

5.3.4 Route Resource Operations

5.3.4.1 ReconnectVirtualRouter

API Request

URLs

```
PUT zstack/v1/vm-instances/appliances/virtual-routers/
{vmInstanceId}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "reconnectVirtualRouter": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth bd24a72b74a148e8b18ee2b2367534d6" \
-X PUT -d '{"reconnectVirtualRouter":{}}' \
http://localhost:8080/zstack/v1/vm-instances/appliances/virtual-
routers/74f9bb00796c366a83a6201df9e26f43/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vmInstanceId	String	url	The VM instance UUID		0.6
systemTags	List	body	Optional. The system tags.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```

action.sessionId = "99e6b06b41ff4d16bb2c2b11e4e3a7bb"
GetAttachablePublicL3ForVRouterAction.Result res = action.call()
```

5.3.4.8 vRouter Route Table Operations

5.3.4.8.1 CreateVRouterRouteTable

API Request

URLs

```
POST zstack/v1/vrouter-route-tables
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "Test-VRouterRouteTable",
    "description": "Test-VRouterRouteTable"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"name":"Test-VRouterRouteTable","description":"Test-VRouterRouteTable"}}' \
http://localhost:8080/zstack/v1/vrouter-route-tables
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The resource name.		2.1
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		2.1
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		2.1
systemTags	List	body	Optional. The system tags.		2.1
userTags	List	body	Optional. The user tags.		2.1

API Response

Sample Response

```
{
  "inventory": {
    "name": "test-route-table",
    "description": "Test route table",
    "attachedRouterRefs": [],
    "routeEntries": []
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.1
inventory	VRouterRouteTableInventory	See inventory .	2.1

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	2.1
description	String	The brief description of the error.	2.1
details	String	The details about the error.	2.1
elaboration	String	The reserved field. Default value: null.	2.1
opaque	LinkedHashMap	The reserved field. Default value: null.	2.1
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	2.1

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	2.1
name	String	The resource name.	2.1
description	String	The detailed description of the resource.	2.1
createDate	Timestamp	The creation date.	2.1
lastOpDate	Timestamp	The last operation date.	2.1
attachedRouterRefs	List	See attachedRouterRefs .	2.1
routeEntries	List	See routeEntries .	2.1

#attachedRouterRefs

Name	Type	Description	Starting Version
virtualRouterVmUuid	String		2.1
routeTableUuid	String		2.1

#routeEntries

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	2.1
description	String	The detailed description of the resource.	2.1
type	String	The type. You can add two types of routes: static route and black hole route . The system will automatically determine the type by judging whether to enter the next hop.	2.1
routeTableUuid	String	The vRouter route table UUID.	2.1
destination	String	The destination network address.	2.1
target	String	The next hop address. The IP address that can be accessed directly by vRouter VM instances. If the IP address cannot be accessed directly, the route recursion will be triggered.	2.1
distance	Integer	The route priority. In the minimum match mode, if multiple route	2.1

Name	Type	Description	Starting Version
		rules are available, the rule with the lowest integer has the highest priority to be matched.	
createDate	Timestamp	The creation date.	2.1
lastOpDate	Timestamp	The last operation date.	2.1

SDK Sample

Java SDK

```
CreateVRouterRouteTableAction action = new CreateVRouterRouteTableAction();
action.name = "Test-VRouterRouteTable";
action.description = "Test-VRouterRouteTable";
action.sessionId = "36ae8b4476774bbd819b694d466f5351";
CreateVRouterRouteTableAction.Result res = action.call();
```

Python SDK

```
CreateVRouterRouteTableAction action = CreateVRouterRouteTableAction()
action.name = "Test-VRouterRouteTable"
action.description = "Test-VRouterRouteTable"
action.sessionId = "c68d30a1ccc9487381ea5ec872cfcccd"
CreateVRouterRouteTableAction.Result res = action.call()
```

5.3.4.8.2 DeleteVRouterRouteTable

API Request

URLs

```
DELETE zstack/v1/vrouter-route-tables/{uuid}?deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth c92c3c7cf7c64dac9e783ab3414e7901" \
-X DELETE http://localhost:8080/zstack/v1/vrouter-route-tables/865cd01ad01f4c46b0a63163eb13e20b?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.1
deleteMode	String	url	Optional. The delete mode.		2.1
systemTags	List	body	Optional. The system tags.		2.1
userTags	List	body	Optional. The user tags.		2.1

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteVRouterRouteTableAction action = new DeleteVRouterRouteTableAction();
action.uuid = "fb0b9186685544bcb5af032b1426736a";
action.deleteMode = "Permissive";
action.sessionId = "aa1c19e2398949c99132c47e97f11569";
DeleteVRouterRouteTableAction.Result res = action.call();
```

Python SDK

```
DeleteVRouterRouteTableAction action = DeleteVRouterRouteTableAction()
action.uuid = "dcf18f99774046de99d5791bfba27b35"
action.deleteMode = "Permissive"
action.sessionId = "c2345a70fb6b4ffabc717ca555e60782"
```

```
DeleteVRouterRouteTableAction.Result res = action.call()
```

5.3.4.8.3 QueryVRouterRouteTable

API Request

URLs

```
GET zstack/v1/vrouter-route-tables
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 48eaf58e3b6e4c51a56c8d9caa991311" \
-X GET http://localhost:8080/zstack/v1/vrouter-route-tables
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 20f83215e3bf491782fe7646a42b5c8b" \
-X GET http://localhost:8080/zstack/v1/vrouter-route-tables/3b8991d7295a4cccb08d028911a9164b
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryVRouterRouteTable`, and pressing the **Tab** key.

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
QueryVRouterRouteTableAction action = new QueryVRouterRouteTableAction
();
action.conditions = asList();
action.sessionId = "1e7d262944584f57a8908c9acd1ec62f";
```

```
QueryVRouterRouteTableAction.Result res = action.call();
```

Python SDK

```
QueryVRouterRouteTableAction action = QueryVRouterRouteTableAction()
action.conditions = []
action.sessionId = "6ad6d8b304984d3ba5b64ddd2062efcb"
QueryVRouterRouteTableAction.Result res = action.call()
```

5.3.4.8.4 GetVRouterRouteTable

API Request

URLs

```
GET zstack/v1/vrouter-route-tables/vrouter/{virtualRouterVmUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth ef1c95285ef3435c949854955edc6c66" \
-X GET http://localhost:8080/zstack/v1/vrouter-route-tables/
vrouter/27e810f019b74106877814ddb0c6e3bf
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
virtualRouterVmUuid	String	url	The VM instance UUID		2.1
systemTags	List	query	Optional. The system tags.		2.1
userTags	List	query	Optional. The user tags.		2.1

API Response

Sample Response

```
{
  "inventories": [
    {
      "type": "ZStack"
      "destination": "0.0.0.0/0"
    }
  ]
}
```

```

        "status": "selected"
    },
    ],
}

```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation	2.1

Name	Type	Description	Starting Version
		fails, or vice versa. For more information, see error .	
inventories	List	See inventories .	2.1

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	2.1
description	String	The brief description of the error.	2.1
details	String	The details about the error.	2.1
elaboration	String	The reserved field. Default value: null.	2.1
opaque	LinkedHashMap	The reserved field. Default value: null.	2.1
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	2.1

#inventories

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	2.1
description	String	The detailed description of the resource.	2.1
type	String	The type. The UserStatic and UserBlackHole types	2.1

Name	Type	Description	Starting Version
		can be added by users. The ZStack type is added by the system. The DirectConnect type means the directly connected route.	
destination	String	The destination network address.	2.1
target	String	The next hop address or NIC.	2.1
distance	Integer	The route priority. In the minimum match mode, if multiple route rules are available, the rule with the lowest integer has the highest priority to be matched.	2.1
status	String	The route status. Options: • active: active route • inactive: inactive route • selected: active route in the multi-path routes	2.1

SDK Sample

Java SDK

```
GetVRouterRouteTableAction action = new GetVRouterRouteTableAction();
action.virtualRouterVmUuid = "dfa2698bd9f04cd5be56e5b51826359d";
action.sessionId = "8fbf06a3245a42fc99ef63f618364de7";
GetVRouterRouteTableAction.Result res = action.call();
```

Python SDK

```
GetVRouterRouteTableAction action = GetVRouterRouteTableAction()
action.virtualRouterVmUuid = "1646d8ca4e144f63896c26488491e016"
action.sessionId = "161364959641477981aa68cd63b19348"
```

```
GetVRouterRouteTableAction.Result res = action.call()
```

5.3.4.8.5 AddVRouterRouteEntry

API Request

URLs

```
POST zstack/v1/vrouter-route-tables/{routeTableUuid}/route-entries
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "description": "Test route",
    "type": "UserStatic",
    "destination": "192.168.2.0/24",
    "target": "172.20.1.1"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"description":"Test
route","type":"UserStatic","destination":"192.168.2.0/24","target":"172.20.1.1"}}' \
http://localhost:8080/zstack/v1/vrouter-route-
tables/011e554588e93a849e890685d6adb6be/route-entries
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		2.1

Name	Type	Location	Description	Optional Value	Starting Version
type	String	body (contained in the params structure)	Optional. The type. You can add two types of routes : static route and black hole route. The system will automatically determine the type by judging whether to enter the next hop.	- UserStatic - UserBlackHole	2.1
routeTable Uuid	String	url	The vRouter route table UUID.		2.1
destination	String	body (contained in the params structure)	The destination network address, in CIDR format. If you enter a non-standard CIDR, note that the system will automatically transform it to the standard CIDR format.		2.1
target	String	body (contained in the params structure)	Optional. The next hop address.		2.1

Name	Type	Location	Description	Optional Value	Starting Version
			The IP address that can be accessed directly by vRouter VM instances . If the IP address cannot be accessed directly, the route recursion will be triggered.		
distance	Integer	body (contained in the params structure)	Optional. The route priority. In the minimum match mode , if multiple route rules are available , the rule with the lowest integer has the highest priority to be matched.		2.1
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		2.1
systemTags	List	body	Optional. The system tags.		2.1
userTags	List	body	Optional. The user tags.		2.1

API Response

Sample Response

```
{
  "inventory": {
    "description": "Test route",
    "type": "UserStatic",
    "routeTableUuid": "5dad5ac78c3642088dc3ed6bc4d8c853",
    "destination": "192.168.2.0/24",
    "target": "172.20.1.1",
    "distance": 128.0
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.1
inventory	VRouterRouteEntryInventory	See inventory .	2.1

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	2.1
description	String	The brief description of the error.	2.1
details	String	The details about the error.	2.1
elaboration	String	The reserved field. Default value: null.	2.1
opaque	LinkedHashMap	The reserved field. Default value: null.	2.1
cause	ErrorCode	The root error, which is the associated root	2.1

Name	Type	Description	Starting Version
		cause of the current error. If no root error exists, this parameter is null.	

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	2.1
description	String	The detailed description of the resource.	2.1
type	String	The type. You can add two types of routes: static route and black hole route. The system will automatically determine the type by judging whether to enter the next hop.	2.1
routeTableUuid	String	The vRouter route table UUID.	2.1
destination	String	The destination network address.	2.1
target	String	The next hop address. The IP address that can be accessed directly by vRouter VM instances. If the IP address cannot be accessed directly, the route recursion will be triggered.	2.1
distance	Integer	The route priority. In the minimum match mode, if multiple route rules are available, the rule with the lowest	2.1

Name	Type	Description	Starting Version
		integer has the highest priority to be matched.	
createDate	Timestamp	The creation date.	2.1
lastOpDate	Timestamp	The last operation date.	2.1

SDK Sample

Java SDK

```
AddVRouterRouteEntryAction action = new AddVRouterRouteEntryAction();
action.description = "Test route";
action.type = "UserStatic";
action.routeTableUuid = "5c33ae47c7c94aaea08ead913ddfe0b4";
action.destination = "192.168.2.0/24";
action.target = "172.20.1.1";
action.sessionId = "f75a12a294fe4128b105e1d8f97257b3";
AddVRouterRouteEntryAction.Result res = action.call();
```

Python SDK

```
AddVRouterRouteEntryAction action = AddVRouterRouteEntryAction()
action.description = "Test route"
action.type = "UserStatic"
action.routeTableUuid = "4fab7c04998c44b4b6d2bc4da0b35ddb"
action.destination = "192.168.2.0/24"
action.target = "172.20.1.1"
action.sessionId = "1510b167ddf54461b69e41802ddcf5eb"
AddVRouterRouteEntryAction.Result res = action.call()
```

5.3.4.8.6 DeleteVRouterRouteEntry

API Request

URLs

```
DELETE zstack/v1/vrouter-route-tables/{routeTableUuid}/route-entries/
{uuid}?deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 07ed3c114a7f4ca0a10861d448a8b973" \
```

```
-X DELETE http://localhost:8080/zstack/v1/vrouter-
route-tables/a713099cca4c487e8ee46ed2ad798903/route-
entries/44f6816c4c7444b9b93b11c385f2bb19?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.1
routeTable Uuid	String	url			2.1
deleteMode	String	url	Optional. The delete mode.		2.1
systemTags	List	body	Optional. The system tags.		2.1
userTags	List	body	Optional. The user tags.		2.1

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteVRouterRouteEntryAction action = new DeleteVRouterRouteEn
tryAction();
action.uuid = "6cc2578afb134d03959feb8cd586de06";
action.routeTableUuid = "e9b7f623b59d4cb5832a0eef61fdc273";
action.deleteMode = "Permissive";
action.sessionId = "eeda6890b1a2428087ae1c3d5b8e1311";
DeleteVRouterRouteEntryAction.Result res = action.call();
```

Python SDK

```
DeleteVRouterRouteEntryAction action = DeleteVRouterRouteEntryAction()
action.uuid = "eb9a0a4ab242430896d50be1a75c1c0d"
```

```
action.routeTableUuid = "295cbd7c2b1746ba9907eabecdb6cdf0"  
action.deleteMode = "Permissive"  
action.sessionId = "dd36b5ccb2444679820945da4ba4ebf3"  
DeleteVRouterRouteEntryAction.Result res = action.call()
```

5.3.4.8.7 QueryVRouterRouteEntry

API Request

URLs

```
GET zstack/v1/vrouter-route-tables/route-entries
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \  
-H "Authorization: OAuth 0a9d413ce14245f89cde947aa57ae4c3" \  
-X GET http://localhost:8080/zstack/v1/vrouter-route-tables/route-  
entries
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \  
-H "Authorization: OAuth eb2e3203532b405cbe9c2fde23deb53e" \  
-X GET http://localhost:8080/zstack/v1/vrouter-route-tables/route-  
entries/6c19d2d2bad3489f8b095c98fea971a5
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryVRouterRouteEntry`, and pressing the **Tab** key.

API Response

Sample Response

```
{  
  "inventories": [  
    {  
      "description": "Test route",

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	2.1
description	String	The brief description of the error.	2.1
details	String	The details about the error.	2.1
elaboration	String	The reserved field. Default value: null.	2.1
opaque	LinkedHashMap	The reserved field. Default value: null.	2.1
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	2.1

#inventories

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	2.1

Name	Type	Description	Starting Version
description	String	The detailed description of the resource.	2.1
type	String	The type. You can add two types of routes: static route and black hole route. The system will automatically determine the type by judging whether to enter the next hop.	2.1
routeTableUuid	String	The vRouter route table UUID.	2.1
destination	String	The destination network address.	2.1
target	String	The next hop address. The IP address that can be accessed directly by vRouter VM instances. If the IP address cannot be accessed directly, the route recursion will be triggered.	2.1
distance	Integer	The route priority. In the minimum match mode, if multiple route rules are available, the rule with the lowest integer has the highest priority to be matched.	2.1
createDate	Timestamp	The creation date.	2.1
lastOpDate	Timestamp	The last operation date.	2.1

SDK Sample

Java SDK

```
QueryVRouterRouteEntryAction action = new QueryVRouterRouteEntryAction();
action.conditions = asList();
action.sessionId = "4388bb850faf4cf69e13ecb9bbdcd77e";
QueryVRouterRouteEntryAction.Result res = action.call();
```

Python SDK

```
QueryVRouterRouteEntryAction action = QueryVRouterRouteEntryAction()
action.conditions = []
action.sessionId = "116b877273e84748994435d8603423b4"
QueryVRouterRouteEntryAction.Result res = action.call()
```

5.3.4.8.8 AttachVRouterRouteTableToVRouter

API Request

URLs

```
POST zstack/v1/vrouter-route-tables/{routeTableUuid}/attach
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "virtualRouterVmUuid": "49e427183ffe4dd8b7c40a635f11f71b"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"virtualRouterVmUuid":"2b8bbccba54438e994d4d14d570a1807"}}' \
```

```
http://localhost:8080/zstack/v1/vrouter-route-tables/
ee1fc77524993a60a8c0e4b7245470db/attach
```

Request Parameters

Name	Type	Location	Description	Optional Value	Description
routeTable Uuid	String	url			2.1
virtualRou terVmUuid	String	body (contained in the params structure)	The VM instance UUID .		2.1
systemTags	List	body	Optional. The system tags.		2.1
userTags	List	body	Optional. The user tags.		2.1

		cause of the current error. If no root error exists, this parameter is null.	

#inventories

Name	Type	Description	Starting Version
virtualRouterVmUuid	String		2.1
routeTableUuid	String		2.1

SDK Sample

Java SDK

```
QueryVirtualRouterVRouterRouteTableRefAction action = new QueryVirtualRouterVRouterRouteTableRefAction();
action.conditions = asList();
action.sessionId = "ec7b3e5724604965a1dcf3c7eb58a7c1";
QueryVirtualRouterVRouterRouteTableRefAction.Result res = action.call();
```

Python SDK

```
QueryVirtualRouterVRouterRouteTableRefAction action = QueryVirtualRouterVRouterRouteTableRefAction()
action.conditions = []
action.sessionId = "b2ca8cc84dae431e95cff3e95ace26c1"
```

```
QueryVirtualRouterVRouterRouteTableRefAction.Result res = action.call()
```

5.3.5 VPC Operations

5.3.5.1 CreateVpcVRouter

API Request

URLs

```
POST zstack/v1/vpc/virtual-routers
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "TestVPC",
    "virtualRouterOfferingUuid": "d9a495f730564ce58328dbfdb1d05721",
    "description": "this is a vpc for test"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"name":"TestVPC","virtualRouterOfferingUuid":"81e8c1f14a6e352884e6941c4a2de95a",
" is a vpc for test"}}' \
http://localhost:8080/zstack/v1/vpc/virtual-routers
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in	The resource name.		2.3

Name	Type	Location	Description	Optional Value	Starting Version
		the params structure)			
virtualRouterOfferingUuid	String	body (contained in the params structure)	The vRouter offering UUID.		2.3
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		2.3
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		2.3
zoneUuid	String	body (contained in the params structure)	Optional. The zone UUID.		3.10.0
clusterUuid	String	body (contained in the params structure)	Optional. The cluster UUID.		3.10.0
hostUuid	String	body (contained in the params structure)	Optional. The host UUID.		3.10.0
systemTags	List	body	Optional. The system tags.		2.3
userTags	List	body	Optional. The user tags.		2.3
primaryStorageUuidForRootVolume	String	body (contained in the params structure)	Optional. The primary storage UUID.		4.4.24
rootVolumeSystemTags	List	body (contained in	Optional. The system tags		4.4.24

Name	Type	Location	Description	Optional Value	Starting Version
		the params structure)	required by VPC vRouter root volume.		

**Note:**

- When you create a VPC vRouter in ZStack Cloud, the cloud records whether the VPC vRouter is added to an HA group. Note that you can add the **haUuid** option to **SystemTags**.
 - Format of the **haUuid** option: `haUuid::HA_GROUP_UUID`
 - Example: `haUuid::e2af8f869eff49d2a3d6f86cadcd27090`
- When you create a VPC vRouter in ZStack Cloud, you can specify a public IP by adding the **staticVip** option to **SystemTags**.
 - Format of the **staticVip** option: `staticVip::L3UUID::IP`. Here, L3UUID is the L3 public network UUID in the vRouter offering, and IP is the public IP address that you specified.
 - Example: `staticVip::4ed5cce4f55a43aca8e61ebbc0c3985d::172.20.1.1`

installPath	String	The installation path.	2.3
type	String	The volume type.	2.3
format	String	The volume format.	2.3
size	Long	The virtual size of the volume.	2.3
actualSize	Long	The actual size of the volume.	2.3
deviceId	Integer	The device ID.	2.3

Name	Type	Description	Starting Version
state	String	The state of the volume.	2.3
status	String	The status of the volume.	2.3
createDate	Timestamp	The creation date.	2.3
lastOpDate	Timestamp	The last operation date.	2.3
volumeQos	String		2.3
lastDetachDate	Timestamp		2.3
lastVmInstanceUuid	String		2.3
isShareable	Boolean	Whether the volume is shareable.	2.3

SDK Sample

Java SDK

```
CreateVpcVRouterAction action = new CreateVpcVRouterAction();
action.name = "TestVPC";
action.virtualRouterOfferingUuid = "c9cfb57035294ff4abeb400922f50d09";
action.description = "this is a vpc for test";
action.sessionId = "41652c67906143948e1fecc1054b65bd";
CreateVpcVRouterAction.Result res = action.call();
```

Python SDK

```
CreateVpcVRouterAction action = CreateVpcVRouterAction()
action.name = "TestVPC"
action.virtualRouterOfferingUuid = "a7eaafd48945481fa2d9a35032b8770b"
action.description = "this is a vpc for test"
action.sessionId = "9d1cc409dd8b47d3aa4ead7bccf875f2"
CreateVpcVRouterAction.Result res = action.call()
```

5.3.5.2 QueryVpcRouter

API Request

URLs

```
GET zstack/v1/vpc/virtual-routers
```

```
GET zstack/v1/vpc/virtual-routers/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/vpc/virtual-routers?
q=name=vpcRouter
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/vpc/virtual-
routers/205d11a687d03b46852d4d24fc85ae75
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryVpcRouter`, and pressing the **Tab** key.

SDK Sample

Java SDK

```
QueryVpcRouterAction action = new QueryVpcRouterAction();  
action.conditions = asList("name=vpcRouter");  
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";  
QueryVpcRouterAction.Result res = action.call();
```

Python SDK

```
QueryVpcRouterAction action = QueryVpcRouterAction()  
action.conditions = ["name=vpcRouter"]  
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
QueryVpcRouterAction.Result res = action.call()
```

5.3.5.3 GetAttachableVpcL3Network

API Request

URLs

```
POST zstack/v1/vpc/virtual-routers/{uuid}/attachable-vpc-l3s
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{}}' http://localhost:8080/zstack/v1/vpc/
virtual-routers/417478f0b61732408176f16615ab6d32/attachable-vpc-l3s
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.3
systemTags	List	body	Optional. The system tags.		2.3
userTags	List	body	Optional. The user tags.		2.3

}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"stateEvent":"enable"}}' \
http://localhost:8080/zstack/v1/vpc/virtual-routers/
fed6eb5e41d83512ba1f836b5473b4fc/distributed-routing
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.3
stateEvent	String	body (contained in the params structure)	The state of the resource.	• enable • disable	2.3
systemTags	List	body	Optional. The system tags.		2.3
userTags	List	body	Optional. The user tags.		2.3

API Response

Sample Response

```
{
  "enabled": true
}
```

Name	Type	Description	Starting Version
enabled	boolean	Checks whether the distributed routing of the VPC vRouter is enabled.	2.3
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.3

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	2.3

Name	Type	Description	Starting Version
description	String	The brief description of the error.	2.3
details	String	The details about the error.	2.3
elaboration	String	The reserved field. Default value: null.	2.3
opaque	LinkedHashMap	The reserved field. Default value: null.	2.3
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	2.3

SDK Sample

Java SDK

```
SetVpcVRouterDistributedRoutingEnabledAction action = new SetVpcVRouterDistributedRoutingEnabledAction();
action.uuid = "fed6eb5e41d83512ba1f836b5473b4fc";
action.stateEvent = "enable";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
SetVpcVRouterDistributedRoutingEnabledAction.Result res = action.call();
```

Python SDK

```
SetVpcVRouterDistributedRoutingEnabledAction action = SetVpcVRouterDistributedRoutingEnabledAction()
action.uuid = "fed6eb5e41d83512ba1f836b5473b4fc"
action.stateEvent = "enable"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
SetVpcVRouterDistributedRoutingEnabledAction.Result res = action.call
()
```

5.3.5.7 AddDnsToVpcRouter

API Request

URLs

```
POST zstack/v1/vpc/virtual-routers/{uuid}/dns
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "dns": "8.8.8.8"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"dns":"8.8.8.8"}}' \
http://localhost:8080/zstack/v1/vpc/virtual-routers/
a6b12587c0c93b50956c689cae6e4404/dns
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.4.0
dns	String	body (contained in the params structure)			2.4.0

Name	Type	Location	Description	Optional Value	Starting Version
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		2.4.0
systemTags	List	body	Optional. The system tags.		2.4.0
userTags	List	body	Optional. The user tags.		2.4.0

routers/51d5917daba83390978604d7b9c8c13a/networkservicestate?
networkService=SNAT
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.4.0
networkService	String	query	The vRouter network service.	• SNAT	3.4.0
systemTags	List	query	Optional. The vRouter system tags.		3.4.0
userTags	List	query	Optional. The vRouter user tags.		3.4.0

**Note:**

- When you obtain the network service state of a VPC vRouter in ZStack Cloud, you can disable the SNAT service of the VPC vRouter by adding the **disabledService** option to **SystemTags**.
 - Format of the **disabledService** option: `disabledService::SNAT`
 - Example: `disabledService::SNAT`
 - If the **SystemTag** of the VPC vRouter does not contain the `resourceType::VirtualRouterVmV0` flag, the SNAT service of the VPC vRouter is enabled. Otherwise, if the **SystemTag** contains the `resourceType::VirtualRouterVmV0` flag, the SNAT service is disabled.

API Response

Sample Response

```
{
  "state": "enable"
}
```

Name	Type	Description	Starting Version
state	String		3.4.0

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.4.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	3.4.0
description	String	The brief description of the error.	3.4.0
details	String	The details about the error.	3.4.0
elaboration	String	The reserved field. Default value: null.	3.4.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.4.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.4.0

SDK Sample

Java SDK

```
GetVpcVRouterNetworkServiceStateAction action = new GetVpcVRouterNetworkServiceStateAction();
action.uuid = "51d5917daba83390978604d7b9c8c13a";
action.networkService = "SNAT";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
GetVpcVRouterNetworkServiceStateAction.Result res = action.call();
```

Python SDK

```
GetVpcVRouterNetworkServiceStateAction action = GetVpcVRouterNetwork
ServiceStateAction()
action.uuid = "51d5917daba83390978604d7b9c8c13a"
action.networkService = "SNAT"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetVpcVRouterNetworkServiceStateAction.Result res = action.call()
```

5.3.5.10 SetVpcVRouterNetworkServiceState

API Request

URLs

```
POST zstack/v1/vpc/virtual-routers/{uuid}/networkservicestate
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "networkService": "SNAT",
    "state": "enable"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"networkService":"SNAT","state":"enable"}}'
http://localhost:8080/zstack/v1/vpc/virtual-
routers/824ad6ab1b5a3bd1ad935fa098d77826/networkservicestate
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.4.0
networkService	String	body (contained in the params structure)	The vRouter network service.	• SNAT	3.4.0
state	String	body (contained in the params structure)	The service state.	• enable • disable	3.4.0
systemTags	List	body	Optional. The vRouter system tags.		3.4.0
userTags	List	body	Optional. The vRouter user tags.		3.4.0

**Note:**

- When you obtain the network service state of a VPC vRouter in ZStack Cloud, you can disable the SNAT service of the VPC vRouter by adding the **disabledService** option to **SystemTags**.
 - Format of the **disabledService** option: `disabledService::SNAT`
 - Example: `disabledService::SNAT`
 - If the **SystemTag** of the VPC vRouter does not contain the `resourceType::VirtualRouterVmV0` flag, the SNAT service of the VPC vRouter is enabled. Otherwise, if the **SystemTag** contains the `resourceType::VirtualRouterVmV0` flag, the SNAT service is disabled.

API Response

SDK Sample

Java SDK

```
CreateVpcHaGroupAction action = new CreateVpcHaGroupAction();
action.name = "vpcha-router";
action.description = "this is a vpc for test";
action.monitorIps = asList("8.8.8.8");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateVpcHaGroupAction.Result res = action.call();
```

Python SDK

```
CreateVpcHaGroupAction action = CreateVpcHaGroupAction()
action.name = "vpcha-router"
action.description = "this is a vpc for test"
action.monitorIps = [8.8.8.8]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CreateVpcHaGroupAction.Result res = action.call()
```

5.3.5.13 DeleteVpcHaGroup

API Request

URLs

```
DELETE zstack/v1/vpc/hagroups/{uuid}?deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/vpc/hagroups/90376847491b3d9a85df382f65d60a16?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.5.1

Name	Type	Location	Description	Optional Value	Starting Version
deleteMode	String	body	Optional. The delete mode.		3.5.1
systemTags	List	body	Optional. The system tags.		3.5.1
userTags	List	body	Optional. The user tags.		3.5.1

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteVpcHaGroupAction action = new DeleteVpcHaGroupAction();
action.uuid = "90376847491b3d9a85df382f65d60a16";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteVpcHaGroupAction.Result res = action.call();
```

Python SDK

```
DeleteVpcHaGroupAction action = DeleteVpcHaGroupAction()
action.uuid = "90376847491b3d9a85df382f65d60a16"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
DeleteVpcHaGroupAction.Result res = action.call()
```

5.3.5.14 UpdateVpcHaGroup

API Request

URLs

```
PUT zstack/v1/vpc/hagroups/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateVpcHaGroup": {
    "name": "ha-1",
    "description": "vpc ha test"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateVpcHaGroup":{"name":"ha-1","description":"vpc
ha test"}}' http://localhost:8080/zstack/v1/vpc/
hagroups/0f3d8a0c297f3972b798d128070ca785/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.5.1
name	String	body (contained in the updateVpcH	Optional. The resource name.		3.5.1

Name	Type	Location	Description	Optional Value	Starting Version
		aGroup structure)			
description	String	body (contained in the updateVpCH aGroup structure)	Optional. The detailed description of the resource.		3.5.1
systemTags	List	body	Optional. The system tags.		3.5.1
userTags	List	body	Optional. The user tags.		3.5.1

API Response

Sample Response

```
{

```
UpdateVpcHaGroupAction action = UpdateVpcHaGroupAction()
action.uuid = "0f3d8a0c297f3972b798d128070ca785"
action.name = "ha-1"
action.description = "vpc ha test"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateVpcHaGroupAction.Result res = action.call()
```

5.3.5.15 QueryVpcHaGroup

API Request

URLs

```
GET zstack/v1/vpc/hagroups
GET zstack/v1/vpc/hagroups/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/vpc/hagroups?
q=uuid=3c5648a2a8a931cb9396d07479e833f7
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
```

```
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/vpc/
hagroups/2dc01a9b66a73a9399a7c1f29c91863a
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryVpchaGroup**, and pressing the **Tab** key.

SDK Sample

Java SDK

```
QueryVpcHaGroupAction action = new QueryVpcHaGroupAction();
action.conditions = asList("uuid=26a2360f164c3a7fba94281b9e24046c");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryVpcHaGroupAction.Result res = action.call();
```

Python SDK

```
QueryVpcHaGroupAction action = QueryVpcHaGroupAction()
action.conditions = ["uuid=ddbc6e5deae3f3dfad33738ea1daefca"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryVpcHaGroupAction.Result res = action.call()
```

5.3.5.16 UpdateVirtualRouter

API Request

URLs

```
PUT zstack/v1/vm-instances/appliances/virtual-routers/
{vmInstanceId}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateVirtualRouter": {
    "defaultRouteL3NetworkUuid": "9889c6be639d3aefb72ae84f435c94c7"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateVirtualRouter":
{"defaultRouteL3NetworkUuid":"9889c6be639d3aefb72ae84f435c94c7"}}'
http://localhost:8080/zstack/v1/vm-instances/appliances/virtual-
routers/abd7e9700ed839a583c5af6f8b4dd417/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vmInstanceUuid	String	body (contained in the updateVirtualRouter structure)	The resource UUID.		3.9.0
defaultRouteL3NetworkUuid	String	body (contained in the updateVirtualRouter structure)	Optional. The default route L3 network UUID.		3.9.0
systemTags	List	body	Optional. The system tags.		3.9.0
userTags	List	body	Optional. The user tags.		3.9.0

API Response

Sample Response

```
{
  "inventory": {
    "publicNetworkUuid": "142981c8c8243113b52db453575fb03f",

SDK Sample

Java SDK

```
UpdateVirtualRouterAction action = new UpdateVirtualRouterAction();
action.vmInstanceUuid = "abd7e9700ed839a583c5af6f8b4dd417";
action.defaultRouteL3NetworkUuid = "9889c6be639d3aefb72ae84f435c94c7";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateVirtualRouterAction.Result res = action.call();
```

Python SDK

```
UpdateVirtualRouterAction action = UpdateVirtualRouterAction()
action.vmInstanceUuid = "abd7e9700ed839a583c5af6f8b4dd417"
action.defaultRouteL3NetworkUuid = "9889c6be639d3aefb72ae84f435c94c7"
```

```
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateVirtualRouterAction.Result res = action.call()
```

5.3.5.17 UpdateVirtualRouterSoftwareVersion

API Request

URLs

```
POST zstack/v1/vpc/virtual-routers/{uuid}/softwareversion
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "softwareName": "IPsec",
    "targetVersion": "5.9.4"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"softwareName":"IPsec","targetVersion":"5.9.4"}}' \
http://localhost:8080/zstackv1/vpc/virtual-
routers/8971d40547ca3641ac809bb967426e17/softwareversion
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		4.5.0
softwareName	String	body (contained in	The VPC software name	IPsec	4.5.0

Name	Type	Location	Description	Optional Value	Starting Version
		the params structure)			
targetVersion	String	body (contained in the params structure)	The target version.	4.5.2 5.9.4	4.5.0
systemTags	List	body	Optional. The system tag.		4.5.0
userTags	List	body	Optional. the user tag.		4.5.0

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
UpdateVirtualRouterSoftwareVersionAction action = new UpdateVirtualRouterSoftwareVersionAction();
action.uuid = "8971d40547ca3641ac809bb967426e17";
action.softwareName = "IPsec";
action.targetVersion = "5.9.4";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateVirtualRouterSoftwareVersionAction.Result res = action.call();
```

Python SDK

```
UpdateVirtualRouterSoftwareVersionAction action = UpdateVirtualRouterSoftwareVersionAction()
action.uuid = "8971d40547ca3641ac809bb967426e17"
action.softwareName = "IPsec"
action.targetVersion = "5.9.4"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
UpdateVirtualRouterSoftwareVersionAction.Result res = action.call()
```

5.3.5.18 GetVirtualRouterSoftwareVersion

API Request

URLs

```
GET zstack/v1/vpc/virtual-routers/{uuid}/softwareversion
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/vpc/virtual-routers/
softwareversion \
uuid=c25bedf80bde367a86344add1264ed06&softwareName=IPsec&needUpdate=false
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	query	Optional. The resource UUID.		4.5.0
softwareName	String	query	The VPC software name.	IPsec	4.5.0
needUpdate	Boolean	query	Optional. Choose whether to update.		4.5.0
systemTags	List	query	Optional. The system tag.		4.5.0
userTags	List	query	Optional. The user tag.		4.5.0

API Response

action.softwareName = "IPsec"
action.needUpdate = false
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetVirtualRouterSoftwareVersionAction.Result res = action.call()
```

5.3.5.19 GetRouteTableVpcVRouterCandidate

API Request

URLs

```
POST zstack/v1/vpc/virtual-routers/get-vpc-candidate
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
```

```
"params": {},
"systemTags": [],
"userTags": []
}
```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{}}' http://localhost:8080/zstack/v1/vpc/
virtual-routers/get-vpc-candidate
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
systemTags	List	body	Optional.		4.2.0
userTags	List	body	Optional.		4.2.0

API Response**Sample Response**

```
{
  "inventories": [
    {

l3NetworkUuid	String	The L3 network UUID.	4.2.0
ip	String	The IP address.	4.2.0
mac	String	The MAC address.	4.2.0
hypervisorType	String	The hypervisor type.	4.2.0
netmask	String	The netmask.	4.2.0
gateway	String	The gateway.	4.2.0
metaData	String		4.2.0
ipVersion	Integer	The IP version.	4.2.0
deviceId	Integer	The device ID.	4.2.0
type	String	The NIC type.	4.2.0
createDate	Timestamp	The creation time.	4.2.0

Name	Type	Description	Starting Version
lastOpDate	Timestamp	The last operation time .	4.2.0
usedIps	List	See usedIps .	4.2.0

#usedIps

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	4.2.0
ipRangeUuid	String	The IP range UUID.	4.2.0
l3NetworkUuid	String	The L3 network UUID.	4.2.0
ipVersion	Integer	The IP version.	4.2.0
ip	String	The IP address.	4.2.0
netmask	String	The netmask.	4.2.0
gateway	String	The gateway.	4.2.0
usedFor	String		4.2.0
ipInLong	long		4.2.0
vmNicUuid	String	The VM NIC UUID.	4.2.0
createDate	Timestamp	The creation time.	4.2.0
lastOpDate	Timestamp	The last operation time .	4.2.0

#allVolumes

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	4.2.0
name	String	The resource name.	4.2.0
description	String	The detailed description of the resource.	4.2.0
primaryStorageUuid	String	The primary storage UUID.	4.2.0
vmInstanceUuid	String	The VM UUID.	4.2.0
diskOfferingUuid	String	The disk offering UUID .	4.2.0

Name	Type	Description	Starting Version
rootImageUuid	String	The root volume image UUID.	4.2.0
installPath	String	The installation path of the volume on the primary storage.	4.2.0
type	String	The volume type.	4.2.0
format	String	The volume type.	4.2.0
size	Long	The volume size.	4.2.0
actualSize	Long	The actual size of the volume.	4.2.0
deviceId	Integer		4.2.0
state	String	Indicates whether the disk is enabled.	4.2.0
status	String	The volume status.	4.2.0
createDate	Timestamp	The creation time.	4.2.0
lastOpDate	Timestamp	The last update time.	4.2.0
isShareable	Boolean	Indicates whether the volume is a shared volume.	4.2.0
volumeQos	String	The volume QoS, for example, total=1048576	4.2.0

#vmCdRoms

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	4.2.0
vmInstanceUuid	String	The VM instance UUID.	4.2.0
deviceId	Integer	The device ID.	4.2.0
isoUuid	String	The ISO image UUID.	4.2.0
isoInstallPath	String	The installation path of the ISO image.	4.2.0
name	String	The resource name.	4.2.0

Name	Type	Description	Starting Version
description	String	The detailed description of the resource.	4.2.0
createDate	Timestamp	The creation time.	4.2.0
lastOpDate	Timestamp	The last operation time.	4.2.0

SDK Sample

Java SDK

```
GetRouteTableVpcVRouterCandidateAction action = new GetRouteTableVpcVRouterCandidateAction();
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetRouteTableVpcVRouterCandidateAction.Result res = action.call();
```

Python SDK

```
GetRouteTableVpcVRouterCandidateAction action = GetRouteTableVpcVRouterCandidateAction()
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetRouteTableVpcVRouterCandidateAction.Result res = action.call()
```

5.3.6 OSPF Operations

5.3.6.1 CreateVRouterOspfArea

API Request

URLs

```
POST zstack/v1/routerArea
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "areaId": "1.1.1.1"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json; charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edeb53ca0678c" \
-X POST -d '{"params":{"areaId":"1.1.1.1"}}' http://localhost:8080/zstack/v1/routerArea
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
areald	String	body (contained in the params structure)	The area ID.		3.4.0
areaAuth	String	body (contained in the params structure)	Optional. The authentication mode of the OSPF area.		3.4.0
areaType	String	body (contained in the params structure)	Optional. The area type.		3.4.0
password	String	body (contained in the params structure)	Optional. The password when the authentication mode is plaintext.		3.4.0
keyId	Integer	body (contained in the params structure)	Optional. The key ID when the authentication mode is MD5 checksum.		3.4.0
resourceUuid	String	body (contained in the params structure)	Optional. The area resource UUID.		3.4.0

Name	Type	Location	Description	Optional Value	Starting Version
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID list.		3.4.0
systemTags	List	body	Optional. The system tags.		3.4.0
userTags	List	body	Optional. The user tags.		3.4.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "d82d2b6108b0331b90161b939987e5ae",
    "areaId": "1",
    "type": "Stub",
    "authentication": "Plaintext",
    "password": "password",
    "createDate": "Nov 14, 2017 10:20:57 PM",
    "lastOpDate": "Nov 14, 2017 10:20:57 PM"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.4.0
inventory	RouterAreaInventory	See inventory .	3.4.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.4.0

Name	Type	Description	Starting Version
description	String	The brief description of the error.	3.4.0
details	String	The details about the error.	3.4.0
elaboration	String	The reserved field. Default value: null.	3.4.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.4.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.4.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.4.0
areald	String		3.4.0
type	String		3.4.0
authentication	String		3.4.0
password	String		3.4.0
keyId	Integer		3.4.0
createDate	Timestamp	The creation date.	3.4.0
lastOpDate	Timestamp	The last operation date.	3.4.0

SDK Sample

Java SDK

```
CreateVRouterOspfAreaAction action = new CreateVRouterOspfAreaAction
();
action.areaId = "1.1.1.1";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
CreateVRouterOspfAreaAction.Result res = action.call();
```

Python SDK

```
CreateVRouterOspfAreaAction action = CreateVRouterOspfAreaAction()
action.areaId = "1.1.1.1"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CreateVRouterOspfAreaAction.Result res = action.call()
```

5.3.6.2 DeleteVRouterOspfArea

API Request

URLs

```
DELETE zstack/v1/routerArea/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/
routerArea/8c7d2c714e1231549dd2a66a3f140ae5
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.4.0
deleteMode	String	body	Optional. The delete mode.		3.4.0
systemTags	List	body	Optional. The system tags.		3.4.0
userTags	List	body	Optional. The user tags.		3.4.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
```

```
"error": {
  "code": "SYS.1001",
  "description": "A message or a operation timeout",
  "details": "Create VM on KVM timeout after 300s"
}
```

SDK Sample

Java SDK

```
DeleteVRouterOspfAreaAction action = new DeleteVRouterOspfAreaAction
();
action.uuid = "8c7d2c714e1231549dd2a66a3f140ae5";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteVRouterOspfAreaAction.Result res = action.call();
```

Python SDK

```
DeleteVRouterOspfAreaAction action = DeleteVRouterOspfAreaAction()
action.uuid = "8c7d2c714e1231549dd2a66a3f140ae5"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteVRouterOspfAreaAction.Result res = action.call()
```

5.3.6.3 GetVRouterOspfNeighbor

API Request

URLs

```
GET zstack/v1/routerArea/{vRouterUuid}/neighbor
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/routerArea/
dfb6151287b632599becfc5716b8c374/neighbor
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vRouterUuid	String	url	The vRouter UUID.		3.4.0

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	query	Optional. The system tags.		3.4.0
userTags	List	query	Optional. The user tags.		3.4.0

API Response

Sample Response

```
{
  "neighbors": [
    null,
    null
  ]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.4.0
neighbors	List	See neighbors .	3.4.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	3.4.0
description	String	The brief description of the error.	3.4.0
details	String	The details about the error.	3.4.0
elaboration	String	The reserved field. Default value: null.	3.4.0

Name	Type	Description	Starting Version
opaque	LinkedHashMap	The reserved field. Default value: null.	3.4.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.4.0

#neighbors

Name	Type	Description	Starting Version
id	String		3.4.0
priority	String		3.4.0
state	String		3.4.0
deadTime	String		3.4.0
neighborAddress	String		3.4.0
device	String		3.4.0

SDK Sample

Java SDK

```
GetVRouterOspfNeighborAction action = new GetVRouterOspfNeighborAction();
action.vRouterUuid = "dfb6151287b632599becfc5716b8c374";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetVRouterOspfNeighborAction.Result res = action.call();
```

Python SDK

```
GetVRouterOspfNeighborAction action = GetVRouterOspfNeighborAction()
action.vRouterUuid = "dfb6151287b632599becfc5716b8c374"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetVRouterOspfNeighborAction.Result res = action.call()
```

5.3.6.4 QueryVRouterOspfArea

API Request

URLs

```
GET zstack/v1/routerArea
```

```
GET zstack/v1/routerArea/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/routerArea?q=areaId=1.1.1.1
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/routerArea/
aba25a3e8e0e3b46bcb48042812eb38d
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryVRouterOspfArea**, and pressing the **Tab** key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "uuid": "24b7fb05b43538238f2071c81255fb35",
      "areaId": "1",
      "type": "Standard",
      "authentication": "None",
      "createDate": "Nov 14, 2017 10:20:57 PM",
      "lastOpDate": "Nov 14, 2017 10:20:57 PM"
    }
  ]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.4.0
inventories	List	See inventories .	3.4.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	3.4.0
description	String	The brief description of the error.	3.4.0
details	String	The details about the error.	3.4.0
elaboration	String	The reserved field. Default value: null.	3.4.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.4.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.4.0

#inventories

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.4.0

authentication	String		3.4.0
password	String		3.4.0
keyId	Integer		3.4.0
createDate	Timestamp	The creation date.	3.4.0
lastOpDate	Timestamp	The last operation date.	3.4.0

SDK Sample

Java SDK

```
QueryVRouterOspfAreaAction action = new QueryVRouterOspfAreaAction();
action.conditions = asList("areaId=1.1.1.1");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryVRouterOspfAreaAction.Result res = action.call();
```

Python SDK

```
QueryVRouterOspfAreaAction action = QueryVRouterOspfAreaAction()
action.conditions = ["areaId=1.1.1.1"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryVRouterOspfAreaAction.Result res = action.call()
```

5.3.6.5 GetVRouterRouterId

API Request

URLs

```
GET zstack/v1/routerArea/{vRouterUuid}/routerid
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/
routerArea/9b8b08cd553c3fd1ba4efc3e6c98512d/routerid?
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vRouterUuid	String	url	The vRouter UUID.		3.4.0
systemTags	List	query	Optional. The system tags.		3.4.0
userTags	List	query	Optional. The user tags.		3.4.0

Note:

- When you obtain a router ID in ZStack Cloud, you can obtain the routerId of the router in OSPF by adding the **routeProtocolRouterId** option to **SystemTags**.
 - Format of the **routeProtocolRouterId** option: `routeProtocolRouterId::xxxx`
 - Example: `routeProtocolRouterId::1.1.1.1`

API Response

Sample Response

```
{
  "routerId": "10.10.10.1"
}
```

Name	Type	Description	Starting Version
routerId	String		3.4.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.4.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.4.0
description	String	The brief description of the error.	3.4.0
details	String	The details about the error.	3.4.0
elaboration	String	The reserved field. Default value: null.	3.4.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.4.0
cause	ErrorCode	The root error, which is the associated root	3.4.0

Name	Type	Description	Starting Version
		cause of the current error. If no root error exists, this parameter is null.	

SDK Sample

Java SDK

```
GetVRouterRouterIdAction action = new GetVRouterRouterIdAction();  
action.vRouterUuid = "9b8b08cd553c3fd1ba4efc3e6c98512d";  
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";  
GetVRouterRouterIdAction.Result res = action.call();
```

Python SDK

```
GetVRouterRouterIdAction action = GetVRouterRouterIdAction()  
action.vRouterUuid = "9b8b08cd553c3fd1ba4efc3e6c98512d"  
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"  
GetVRouterRouterIdAction.Result res = action.call()
```

5.3.6.6 SetVRouterRouterId

API Request

URLs

```
POST zstack/v1/routerArea/{vRouterUuid}/routerid
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{  
  "params": {  
    "routerId": "10.10.10.1"  
  },  
  "systemTags": [],  
  "userTags": []  
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"routerId":"10.10.10.1"}}' http://
localhost:8080/zstack/v1/routerArea/7b579cbb55f73f62a5afcfe83c823b7b/
routerid
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vRouterUuid	String	url	The vRouter UUID.		3.4.0
routerId	String	body (contained in the params structure)	The router ID in IP address format.		3.4.0
systemTags	List	body	Optional. The system tags.		3.4.0
userTags	List	body	Optional. The user tags.		3.4.0

**Note:**

- When you set a router ID in ZStack Cloud, you can use the routerID of the router in OSPF by adding the **routeProtocolRouterId** option to **SystemTags**.
 - Format of the **routeProtocolRouterId** option: `routeProtocolRouterId::xxxx`
 - Example: `routeProtocolRouterId::1.1.1.1`

API Response

Sample Response

```
{
  "routerId": "10.10.10.1"
}
```

Name	Type	Description	Starting Version
routerId	String		3.4.0
error	ErrorCode	The error code. If not null, the operation	3.4.0

Name	Type	Description	Starting Version
		fails, or vice versa. For more information, see error .	

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.4.0
description	String	The brief description of the error.	3.4.0
details	String	The details about the error.	3.4.0
elaboration	String	The reserved field. Default value: null.	3.4.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.4.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.4.0

SDK Sample

Java SDK

```
SetVRouterRouterIdAction action = new SetVRouterRouterIdAction();
action.vRouterUuid = "7b579cbb55f73f62a5afcfe83c823b7b";
action.routerId = "10.10.10.1";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
SetVRouterRouterIdAction.Result res = action.call();
```

Python SDK

```
SetVRouterRouterIdAction action = SetVRouterRouterIdAction()
action.vRouterUuid = "7b579cbb55f73f62a5afcfe83c823b7b"
action.routerId = "10.10.10.1"
```

```
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
SetVRouterRouterIdAction.Result res = action.call()
```

5.3.6.7 AddVRouterNetworksToOspfArea

API Request

URLs

```
POST zstack/v1/routerArea/{routerAreaUuid}/router/{vRouterUuid}/
addnetworks
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "l3NetworkUuids": [
      "080a5356667a34e3bda18a157e3743ec"
    ]
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"l3NetworkUuids":
["080a5356667a34e3bda18a157e3743ec"]}}' http://localhost:8080/zstack/
v1/routerArea/2785aa6a32603b7a8a24b5a143975123/router/
beaad9552cd531b7b59c631d0b0f7eb9/addnetworks
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
routerAreaUuid	String	url	The router area UUID.		3.4.0
vRouterUuid	String	url	The VPC vRouter UUID.		3.4.0

Name	Type	Location	Description	Optional Value	Starting Version
l3NetworkUids	List	body (contained in the params structure)	The L3 network UUID.		3.4.0
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		3.4.0
tagUids	List	body (contained in the params structure)	Optional. The tag UUID list.		3.4.0
systemTags	List	body	Optional. The vRouter system tags.		3.4.0
userTags	List	body	Optional. The vRouter user tags.		3.4.0

API Response

Sample Response

```
{
  "inventory": {

SDK Sample

Java SDK

```
AddVRouterNetworksToOspfAreaAction action = new AddVRouterNetworksToOspfAreaAction();
action.routerAreaUuid = "2785aa6a32603b7a8a24b5a143975123";
action.vRouterUuid = "beaad9552cd531b7b59c631d0b0f7eb9";
action.l3NetworkUuids = asList("080a5356667a34e3bda18a157e3743ec");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
AddVRouterNetworksToOspfAreaAction.Result res = action.call();
```

Python SDK

```
AddVRouterNetworksToOspfAreaAction action = AddVRouterNetworksToOspfAreaAction()
action.routerAreaUuid = "2785aa6a32603b7a8a24b5a143975123"
action.vRouterUuid = "beaad9552cd531b7b59c631d0b0f7eb9"
action.l3NetworkUuids = ["080a5356667a34e3bda18a157e3743ec"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
AddVRouterNetworksToOspfAreaAction.Result res = action.call()
```

5.3.6.8 RemoveVRouterNetworksFromOspfArea

API Request

URLs

```
DELETE zstack/v1/routerArea/networks
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/routerArea/networks?
```

Request Parameters

Name	Description	Location	Description	Optional Value	Starting Version
uuids	List	body	The UUID in the network area table.		3.4.0
deleteMode	String	body	Optional. The delete mode.		3.4.0
systemTags	List	body	Optional. The system tags.		3.4.0
userTags	List	body	Optional. The user tags.		3.4.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
RemoveVRouterNetworksFromOspfAreaAction action = new RemoveVRou
terNetworksFromOspfAreaAction();
action.uuids = asList("ad747eefbaf534d4a46822cc02fd329a");
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
RemoveVRouterNetworksFromOspfAreaAction.Result res = action.call();
```

Python SDK

```
RemoveVRouterNetworksFromOspfAreaAction action = RemoveVRouterNetwork
sFromOspfAreaAction()
action.uuids = [ad747eefbaf534d4a46822cc02fd329a]
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
RemoveVRouterNetworksFromOspfAreaAction.Result res = action.call()
```

5.3.6.9 UpdateVRouterOspfArea

API Request

URLs

```
PUT zstack/v1/routerArea/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateVRouterOspfArea": {
    "areaType": "Standard"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X PUT -d '{"updateVRouterOspfArea":{"areaType":"Standard"}}' http://localhost:8080/zstack/v1/routerArea/35bc0bb59575326c822b07a945b48a51/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.4.0
areaAuth	String	body (contained in the updateVRouterOspfArea structure)	Optional. The area authentication mode.		3.4.0
areaType	String	body (contained in the updateVRouterOspfArea structure)	Optional. The area type.		3.4.0
password	String	body (contained in the updateVRouterOspfArea structure)	Optional. The password that is used for area authentication.		3.4.0
keyId	Integer	body (contained in the updateVRouterOspfArea structure)	Optional. The key ID that is used for area authentication.		3.4.0
systemTags	List	body	Optional. The system tags.		3.4.0
userTags	List	body	Optional. The user tags.		3.4.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "b90552421b6a390fa55da5b489a53e32",
    "areaId": "1",
    "type": "Stub",
    "authentication": "MD5",
    "keyId": 128.0,

password	String		3.4.0
keyId	Integer		3.4.0
createDate	Timestamp	The creation date.	3.4.0
lastOpDate	Timestamp	The last operation date.	3.4.0

SDK Sample

Java SDK

```
UpdateVRouterOspfAreaAction action = new UpdateVRouterOspfAreaAction
();
action.uuid = "35bc0bb59575326c822b07a945b48a51";
action.areaType = "Standard";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateVRouterOspfAreaAction.Result res = action.call();
```

Python SDK

```
UpdateVRouterOspfAreaAction action = UpdateVRouterOspfAreaAction()
action.uuid = "35bc0bb59575326c822b07a945b48a51"
action.areaType = "Standard"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateVRouterOspfAreaAction.Result res = action.call()
```

5.3.6.10 QueryVRouterOspfNetwork**API Request**

URLs

```
GET zstack/v1/routerArea/network
```

```
GET zstack/v1/routerArea/networkR/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/routerArea/network?
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/routerArea/networkR/
cbdc3b6f584539508a95f2fe8fc0d6bb
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryVRouterOspfNetwork**, and pressing the **Tab** key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "uuid": "fb2a103989cd3ad581c3ad6931765a2e",

QueryVRouterOspfNetworkAction action = QueryVRouterOspfNetworkAction()
action.conditions = []
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryVRouterOspfNetworkAction.Result res = action.call()
```

5.3.7 Multicast Routing Operations

5.3.7.1 CreateMulticastRouter

API Request

URLs

```
POST zstack/v1/multicast/virtual-routers
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "vpcRouterVmUuid": "6fe7772600d039bf80d8e2359fcef61a",
    "description": "this is a header router for test"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"vpcRouterVmUuid":"6fe7772600d039bf80d8e2359fcef61a","description":"this
is a header router for test"}}' http://localhost:8080/zstack/v1/
multicast/virtual-routers
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vpcRouterVmUuid	String	body (contained in the params structure)			3.7.0
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		3.7.0
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		3.7.0
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID list.		3.7.0
systemTags	List	body	Optional. The system tags.		3.7.0
userTags	List	body	Optional. The user tags.		3.7.0

API Response

Sample Response

```
{

description	String	The brief description of the error.	3.7.0
details	String	The details about the error.	3.7.0
elaboration	String	The reserved field. Default value: null.	3.7.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.7.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.7.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.7.0

Name	Type	Description	Starting Version
vpcRouterUuid	String		3.7.0
description	String	The detailed description of the resource.	3.7.0
state	String		3.7.0
createDate	Timestamp	The creation date.	3.7.0
lastOpDate	Timestamp	The last operation date.	3.7.0
rpGroups	List	See rpGroups .	3.7.0
vpcVrs	List	See vpcVrs .	3.7.0

#rpGroups

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.7.0
multicastRouterUuid	String		3.7.0
rpAddress	String		3.7.0
groupAddress	String		3.7.0
createDate	Timestamp	The creation date.	3.7.0
lastOpDate	Timestamp	The last operation date.	3.7.0

#vpcVrs

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.7.0
vpcRouterUuid	String		3.7.0

SDK Sample

Java SDK

```
CreateMulticastRouterAction action = new CreateMulticastRouterAction
();
action.vpcRouterVmUuid = "6fe7772600d039bf80d8e2359fcef61a";
action.description = "this is a header router for test";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
CreateMulticastRouterAction.Result res = action.call();
```

Python SDK

```
CreateMulticastRouterAction action = CreateMulticastRouterAction()
action.vpcRouterVmUuid = "6fe7772600d039bf80d8e2359fcef61a"
action.description = "this is a header router for test"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CreateMulticastRouterAction.Result res = action.call()
```

5.3.7.2 DeleteMulticastRouter

API Request

URLs

```
DELETE zstack/v1/multicast/virtual-routers/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/multicast/virtual-routers/
cce17d3b823933a8b0694af5159fed4d?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.7.0
deleteMode	String	body	Optional. The delete mode.		3.7.0
systemTags	List	body	Optional. The system tags.		3.7.0
userTags	List	body	Optional. The user tags.		3.7.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteMulticastRouterAction action = new DeleteMulticastRouterAction
();
action.uuid = "cce17d3b823933a8b0694af5159fed4d";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteMulticastRouterAction.Result res = action.call();
```

Python SDK

```
DeleteMulticastRouterAction action = DeleteMulticastRouterAction()
action.uuid = "cce17d3b823933a8b0694af5159fed4d"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteMulticastRouterAction.Result res = action.call()
```

5.3.7.3 QueryMulticastRouter

API Request

URLs

```
GET zstack/v1/multicast/virtual-routers
GET zstack/v1/multicast/virtual-routers/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/multicast/virtual-routers?
q=name=multicastRouter
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
```

```
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/multicast/virtual-
routers/83791299370039dba6b9318e46dfcf69
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryMulticastRouter**, and pressing the **Tab** key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "uuid": "df41b45fd5213ceab084e5b733886ac0",
      "description": "test for header",
      "rpGroups": [

SDK Sample

Java SDK

```
QueryMulticastRouterAction action = new QueryMulticastRouterAction();
action.conditions = asList("name=multicastRouter");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryMulticastRouterAction.Result res = action.call();
```

Python SDK

```
QueryMulticastRouterAction action = QueryMulticastRouterAction()
action.conditions = ["name=multicastRouter"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryMulticastRouterAction.Result res = action.call()
```

5.3.7.4 ChangeMulticastRouterState**API Request**

URLs

```
PUT zstack/v1/multicast/virtual-routers/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeMulticastRouterState": {
    "stateEvent": "enable"
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"changeMulticastRouterState":{"stateEvent":"enable"}}'
http://localhost:8080/zstack/v1/multicast/virtual-
routers/0cbf995f538b3aed855e3e50ea38eb0c/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.7.0
stateEvent	String	body (contained in the changeMulticastRouterState structure)		- enable - disable	3.7.0
systemTags	List	body	Optional. The system tags.		3.7.0
userTags	List	body	Optional. The user tags.		3.7.0

API Response**Sample Response**

```
{
  "inventory": {
    "uuid": "93ce20a6a51932ce8f544033d5cdca3c",

action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetVpcMulticastRouteAction.Result res = action.call()
```

5.3.7.6 AddRendezvousPointToMulticastRouter

API Request

URLs

```
POST zstack/v1/multicast/virtual-routers/{uuid}/RendezvousPoint
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "rpAddress": "1.2.3.4",
    "groupAddress": "239.0.0.1/32"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"rpAddress":"1.2.3.4","groupAddress":"239.0.0.1/32"}}'
http://localhost:8080/zstack/v1/multicast/virtual-routers/
fae38e0915973679ac76cc40da3e2f51/RendezvousPoint
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.7.0
rpAddress	String	body (contained in the params structure)			3.7.0
groupAddress	String	body (contained in the params structure)			3.7.0
resourceUuid	String	body (contained in the params structure)	Optional.		3.7.0
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID list.		3.7.0
systemTags	List	body	Optional. The system tags.		3.7.0
userTags	List	body	Optional. The user tags.		3.7.0

SDK Sample

Java SDK

```
AddRendezvousPointToMulticastRouterAction action = new AddRendezv
ousPointToMulticastRouterAction();
action.uuid = "fae38e0915973679ac76cc40da3e2f51";
action rpAddress = "1.2.3.4";
action.groupAddress = "239.0.0.1/32";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
AddRendezvousPointToMulticastRouterAction.Result res = action.call();
```

Python SDK

```
AddRendezvousPointToMulticastRouterAction action = AddRendezv
ousPointToMulticastRouterAction()
action.uuid = "fae38e0915973679ac76cc40da3e2f51"
action rpAddress = "1.2.3.4"
action.groupAddress = "239.0.0.1/32"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
AddRendezvousPointToMulticastRouterAction.Result res = action.call()
```

5.3.7.7 RemoveRendezvousPointFromMulticastRouter

API Request

URLs

```
DELETE zstack/v1/multicast/virtual-routers/{uuid}/RendezvousPoint
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/multicast/virtual-routers/
b0efeaec578931d49c6c8b457287e1db/RendezvousPoint?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.7.0
rpAddress	String	body			3.7.0
groupAddress	String	body			3.7.0

Name	Type	Location	Description	Optional Value	Starting Version
deleteMode	String	body	Optional. The delete mode.		3.7.0
systemTags	List	body	Optional. The system tags.		3.7.0
userTags	List	body	Optional. The user tags.		3.7.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
RemoveRendezvousPointFromMulticastRouterAction action = new RemoveRendezvousPointFromMulticastRouterAction();
action.uuid = "b0efeaec578931d49c6c8b457287e1db";
action rpAddress = "1.2.3.4";
action.groupAddress = "239.1.1.1/32";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
RemoveRendezvousPointFromMulticastRouterAction.Result res = action.call();
```

Python SDK

```
RemoveRendezvousPointFromMulticastRouterAction action = RemoveRendezvousPointFromMulticastRouterAction()
action.uuid = "b0efeaec578931d49c6c8b457287e1db"
action rpAddress = "1.2.3.4"
action.groupAddress = "239.1.1.1/32"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
RemoveRendezvousPointFromMulticastRouterAction.Result res = action.  
call()
```

5.3.8 Policy Routing Operations

5.3.8.1 CreatePolicyRouteRuleSet

API Request

URLs

```
POST zstack/v1/policy-routes/rulesets
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{  
  "params": {  
    "name": "ruleSet",  
    "description": "description",  
    "vRouterUuid": "85eb5d9f50bc3919b793b3caf9f3e859"  
  },  
  "systemTags": [],  
  "userTags": []  
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \  
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \  
-X POST -d '{"params":  
{"name":"ruleSet","description":"description","vRouterUuid":"85eb5d9f50bc3919b793b3caf9f3e859"}'  
http://localhost:8080/zstack/v1/policy-routes/rulesets
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The resource name.		3.6.0

Name	Type	Location	Description	Optional Value	Starting Version
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		3.6.0
vRouterUuid	String	body (contained in the params structure)	The vRouter UUID.		3.6.0
type	String	body (contained in the params structure)	Optional. The type.	- User - EgressWhereComeFrom	3.9.0
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		3.6.0
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID list.		3.6.0
systemTags	List	body	Optional. The system tags.		3.6.0
userTags	List	body	Optional. The user tags.		3.6.0

API Response

Sample Response

```
{
  "inventory": {
    "name": "name",
    "description": "example-des",
    "rules": [
      {
        "uuid": "74cc4fed46f633f2a618b0e06d122377",
        "ruleNumber": 1.0,
        "ruleSetUuid": "00693e31fa3b3e3fba017ed714c02cdf",
        "tableUuid": "b273e0c273c03559872efa272194492c",
        "destIp": "192.168.1.1",
        "sourceIp": "10.0.0.1",
        "destPort": "22",
        "sourcePort": "80",

```

```

    "protocol": "tcp",
    "state": "enable"
  }
]
}

```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.6.0
inventory	PolicyRouteRuleSetInventory	See inventory .	3.6.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.6.0
description	String	The brief description of the error.	3.6.0
details	String	The details about the error.	3.6.0
elaboration	String	The reserved field. Default value: null.	3.6.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.6.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.6.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.6.0
name	String	The resource name.	3.6.0
description	String	The detailed description of the resource.	3.6.0
type	String		3.9.0
createDate	Timestamp	The creation date.	3.6.0
lastOpDate	Timestamp	The last operation date.	3.6.0
rules	List	See rules	3.6.0
l3Refs	List	See l3Refs .	3.9.0

#rules

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.6.0
ruleNumber	int	The priority.	3.6.0
ruleSetUuid	String	The UUID of the policy route rule set.	3.6.0
tableUuid	String	The policy route table UUID.	3.6.0
destIp	String	The destination IP address.	3.6.0
sourceIp	String	The source IP address.	3.6.0
destPort	String	The destination port.	3.6.0
sourcePort	String	The source port.	3.6.0
createDate	Timestamp	The creation date.	3.6.0
lastOpDate	Timestamp	The last operation date.	3.6.0
protocol	PolicyRouteRuleProtocol	See protocol .	3.6.0
state	PolicyRouteRuleState	See state .	3.6.0

#protocol

Name	Type	Description	Starting Version
tcp	PolicyRouteRuleProtocol		3.6.0
udp	PolicyRouteRuleProtocol		3.6.0

#state

Name	Type	Description	Starting Version
enable	PolicyRouteRuleState		3.6.0
disable	PolicyRouteRuleState		3.6.0

#l3Refs

Name	Type	Description	Starting Version
id	long		3.9.0
l3NetworkUuid	String	The L3 network UUID.	3.9.0
ruleSetUuid	String		3.9.0
createDate	Timestamp	The creation date.	3.9.0
lastOpDate	Timestamp	The last operation date.	3.9.0

SDK Sample

Java SDK

```
CreatePolicyRouteRuleSetAction action = new CreatePolicyRouteRuleSetAction();
action.name = "ruleSet";
action.description = "description";
action.vRouterUuid = "85eb5d9f50bc3919b793b3caf9f3e859";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreatePolicyRouteRuleSetAction.Result res = action.call();
```

Python SDK

```
CreatePolicyRouteRuleSetAction action = CreatePolicyRouteRuleSetAction()
action.name = "ruleSet"
action.description = "description"
action.vRouterUuid = "85eb5d9f50bc3919b793b3caf9f3e859"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
CreatePolicyRouteRuleSetAction.Result res = action.call()
```

5.3.8.2 DeletePolicyRouteRuleSet

API Request

URLs

```
DELETE zstack/v1/policy-routes/ruleSets/{uuid}?deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/policy-routes/ruleSets/
f430004bc0ed315c89eb7909a48d27e7?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.6.0
deleteMode	String	body	Optional. The delete mode.		3.6.0
systemTags	List	body	Optional. The system tags.		3.6.0
userTags	List	body	Optional. The user tags.		3.6.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DeletePolicyRouteRuleSetAction action = new DeletePolicyRouteRuleSetAction();
action.uuid = "f430004bc0ed315c89eb7909a48d27e7";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeletePolicyRouteRuleSetAction.Result res = action.call();
```

Python SDK

```
DeletePolicyRouteRuleSetAction action = DeletePolicyRouteRuleSetAction()
action.uuid = "f430004bc0ed315c89eb7909a48d27e7"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeletePolicyRouteRuleSetAction.Result res = action.call()
```

5.3.8.3 UpdatePolicyRouteRuleSet

API Request

URLs

```
PUT zstack/v1/policy-routes/ruleSets/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updatePolicyRouteRuleSet": {
    "name": "name",
    "description": "desc"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
```

```
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updatePolicyRouteRuleSet":
{"name":"name","description":"desc"}}' http://localhost:8080/zstack/
v1/policy-routes/ruleSets/e58212f4cd0c3f2f96d27dde19de1383/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.6.0
name	String	body (contained in the updatePolicyRouteRuleSet structure)	Optional. The resource name.		3.6.0
description	String	body (contained in the updatePolicyRouteRuleSet structure)	Optional. The detailed description of the resource.		3.6.0
systemTags	List	body	Optional. The system tags.		3.6.0
userTags	List	body	Optional. The user tags.		3.6.0

API Response

Sample Response

```
{
  "inventory": {
    "name": "name",
    "description": "example-des",
    "rules": []
  }
}
```

    "destPort": "22",
    "protocol": "tcp",
    "state": "enable"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.6.0
inventory	PolicyRouteRuleInventory	See inventory .	3.6.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.6.0

Name	Type	Description	Starting Version
description	String	The brief description of the error.	3.6.0
details	String	The details about the error.	3.6.0
elaboration	String	The reserved field. Default value: null.	3.6.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.6.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.6.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.6.0
ruleNumber	int	The priority.	3.6.0
ruleSetUuid	String	The UUID of the policy route rule set.	3.6.0
tableUuid	String	The policy route table UUID.	3.6.0
destIp	String	The destination IP address.	3.6.0
sourceIp	String	The source IP address.	3.6.0
destPort	String	The destination port.	3.6.0
sourcePort	String	The source port.	3.6.0
createDate	Timestamp	The creation date.	3.6.0
lastOpDate	Timestamp	The last operation date.	3.6.0
protocol	PolicyRouteRuleProtocol	See protocol .	3.6.0

Name	Type	Description	Starting Version
state	PolicyRouteRuleState	See state .	3.6.0

#protocol

Name	Type	Description	Starting Version
tcp	PolicyRouteRuleProtocol		3.6.0
udp	PolicyRouteRuleProtocol		3.6.0

#state

Name	Type	Description	Starting Version
enable	PolicyRouteRuleState		3.6.0
disable	PolicyRouteRuleState		3.6.0

SDK Sample

Java SDK

```
CreatePolicyRouteRuleAction action = new CreatePolicyRouteRuleAction();
action.ruleSetUuid = "ec2472bf205931318e02a2bb5356c0ee";
action.tableUuid = "b4c03beba98c3502ac53d784dd9bfe61";
action.ruleNumber = 1001.0;
action.destIp = "192.168.1.0/24";
action.sourceIp = "192.168.2.0/24";
action.destPort = "22";
action.sourcePort = "33";
action.protocol = "tcp";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreatePolicyRouteRuleAction.Result res = action.call();
```

Python SDK

```
CreatePolicyRouteRuleAction action = CreatePolicyRouteRuleAction()
action.ruleSetUuid = "ec2472bf205931318e02a2bb5356c0ee"
action.tableUuid = "b4c03beba98c3502ac53d784dd9bfe61"
action.ruleNumber = 1001.0
action.destIp = "192.168.1.0/24"
action.sourceIp = "192.168.2.0/24"
action.destPort = "22"
action.sourcePort = "33"
action.protocol = "tcp"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
CreatePolicyRouteRuleAction.Result res = action.call()
```

5.3.8.8 DeletePolicyRouteRule

API Request

URLs

```
DELETE zstack/v1/policy-routes/rules/{uuid}?deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/policy-routes/rules/
b02689c3b5513b8db2bb5f45a8c7b169?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.6.0
deleteMode	String	body	Optional. The delete mode.		3.6.0
systemTags	List	body	Optional. The system tags.		3.6.0
userTags	List	body	Optional. The user tags.		3.6.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DeletePolicyRouteRuleAction action = new DeletePolicyRouteRuleAction
();
action.uuid = "b02689c3b5513b8db2bb5f45a8c7b169";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeletePolicyRouteRuleAction.Result res = action.call();
```

Python SDK

```
DeletePolicyRouteRuleAction action = DeletePolicyRouteRuleAction()
action.uuid = "b02689c3b5513b8db2bb5f45a8c7b169"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeletePolicyRouteRuleAction.Result res = action.call()
```

5.3.8.9 CreatePolicyRouteTable

API Request

URLs

```
POST zstack/v1/policy-routes/tables
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "vRouterUuid": "efe77450940f3dfe9023f2589fdeda25",
    "number": 1.0,
    "description": "description"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
```

```
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"vRouterUuid":"efe77450940f3dfe9023f2589fdeda25","number":1.0,"description":"des
http://localhost:8080/zstack/v1/policy-routes/tables
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vRouterUuid	String	body (contained in the params structure)	The vRouter UUID.		3.6.0
number	Integer	body (contained in the params structure)	The table number.		3.6.0
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		3.6.0
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		3.6.0
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID list.		3.6.0
systemTags	List	body	Optional. The system tags.		3.6.0
userTags	List	body	Optional. The user tags.		3.6.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "8bd52616389d3ce7b5d74bc2424d3f8d",
    "tableNumber": 1.0,
    "description": "example-des",
    "routes": [
```

```

    {
      "tableUuid": "2a7ba1261cef3cf19b587e493e479286",
      "destinationCidr": "192.168.1.0/24",
      "nextHopIp": "192.168.1.1",
      "distance": 1.0
    }
  ]
}

```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.6.0
inventory	PolicyRouteTableInventory	See inventory .	3.6.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.6.0
description	String	The brief description of the error.	3.6.0
details	String	The details about the error.	3.6.0
elaboration	String	The reserved field. Default value: null.	3.6.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.6.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.6.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.6.0
tableNumber	int	The table number.	3.6.0
description	String	The detailed description of the resource.	3.6.0
createDate	Timestamp	The creation date.	3.6.0
lastOpDate	Timestamp	The last operation date.	3.6.0
routes	List	See routes .	3.6.0

#routes

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.6.0
tableUuid	String	The policy route table UUID.	3.6.0
destinationCidr	String	The destination CIDR address.	3.6.0
nextHopIp	String	The next hop IP address.	3.6.0
distance	int	The priority.	3.6.0
createDate	Timestamp	The creation date.	3.6.0
lastOpDate	Timestamp	The last operation date.	3.6.0

SDK Sample

Java SDK

```
CreatePolicyRouteTableAction action = new CreatePolicyRouteTableAction();
action.vRouterUuid = "efe77450940f3dfe9023f2589fdeda25";
action.number = 1.0;
action.description = "description";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
CreatePolicyRouteTableAction.Result res = action.call();
```

Python SDK

```
CreatePolicyRouteTableAction action = CreatePolicyRouteTableAction()  
action.vRouterUuid = "efe77450940f3dfe9023f2589fdeda25"  
action.number = 1.0  
action.description = "description"  
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"  
CreatePolicyRouteTableAction.Result res = action.call()
```

5.3.8.10 DeletePolicyRouteTable

API Request

URLs

```
DELETE zstack/v1/policy-routes/tables/{uuid}?deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \  
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \  
-X DELETE http://localhost:8080/zstack/v1/policy-routes/  
tables/4c24bf6b15d3338ab1d66eac97eec58b?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.6.0
deleteMode	String	body	Optional. The delete mode.		3.6.0
systemTags	List	body	Optional. The system tags.		3.6.0
userTags	List	body	Optional. The user tags.		3.6.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeletePolicyRouteTableAction action = new DeletePolicyRouteTableAction
();
action.uuid = "4c24bf6b15d3338ab1d66eac97eec58b";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeletePolicyRouteTableAction.Result res = action.call();
```

Python SDK

```
DeletePolicyRouteTableAction action = DeletePolicyRouteTableAction()
action.uuid = "4c24bf6b15d3338ab1d66eac97eec58b"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeletePolicyRouteTableAction.Result res = action.call()
```

5.3.8.11 QueryPolicyRouteTable

API Request

URLs

```
GET zstack/v1/policy-routes/tables
```

```
GET zstack/v1/policy-routes/tables/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/policy-routes/tables
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
```

```
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/policy-routes/tables/
e32b296e6633331284c5cbbd71cedfa4
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryPolicyRouteTable**, and pressing the **Tab** key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "uuid": "6e39025e9eb432fda488f19e7104fdf0",
      "tableNumber": 1.0,

5.3.8.14 DeletePolicyRouteTableRouteEntry

API Request

URLs

```
DELETE zstack/v1/policy-routes/routes/{uuid}?deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/policy-routes/
routes/7e28a7059fb33a8bb2d7c61b7951303e?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.6.0
deleteMode	String	body	Optional. The delete mode.		3.6.0
systemTags	List	body	Optional. The system tags.		3.6.0
userTags	List	body	Optional. The user tags.		3.6.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DeletePolicyRouteTableRouteEntryAction action = new DeletePolicyRouteTableRouteEntryAction();
action.uuid = "7e28a7059fb33a8bb2d7c61b7951303e";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeletePolicyRouteTableRouteEntryAction.Result res = action.call();
```

Python SDK

```
DeletePolicyRouteTableRouteEntryAction action = DeletePolicyRouteTableRouteEntryAction()
action.uuid = "7e28a7059fb33a8bb2d7c61b7951303e"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeletePolicyRouteTableRouteEntryAction.Result res = action.call()
```

5.3.8.15 QueryPolicyRouteTableRouteEntry

API Request

URLs

```
GET zstack/v1/policy-routes/routes
```

```
GET zstack/v1/policy-routes/routes/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/policy-routes/routes
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/policy-routes/
routes/775c98615c5936f3aab19b6271c9e5dc
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryPolicyRouteTableRouteEntry**, and pressing the **Tab** key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "tableUuid": "49bf5678360b38058ab7096715e219f4",
      "destinationCidr": "192.168.1.0/24",
      "nextHopIp": "192.168.1.1",
      "distance": 1.0
    }
  ]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.6.0
inventories	List	See inventories .	3.6.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.6.0
description	String	The brief description of the error.	3.6.0
details	String	The details about the error.	3.6.0
elaboration	String	The reserved field. Default value: null.	3.6.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.6.0
cause	ErrorCode	The root error, which is the associated root cause of the current	3.6.0

Name	Type	Description	Starting Version
		error. If no root error exists, this parameter is null.	

#inventories

Name	Type	Description	Starting Version
enable	PolicyRouteRuleState		3.6.0
disable	PolicyRouteRuleState		3.6.0

SDK Sample

Java SDK

```
QueryPolicyRouteRuleAction action = new QueryPolicyRouteRuleAction();
action.conditions = asList();
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
QueryPolicyRouteRuleAction.Result res = action.call();
```

Python SDK

```
QueryPolicyRouteRuleAction action = QueryPolicyRouteRuleAction()
action.conditions = []
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryPolicyRouteRuleAction.Result res = action.call()
```

5.3.8.17 AttachPolicyRouteRuleSetToL3

API Request

URLs

```
POST zstack/v1/policy-routes/rulesets/{ruleSetUuid}/l3networks/
{l3Uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{}}' http://localhost:8080/zstack/
v1/policy-routes/rulesets/1e6eb259093e3fa2a30c837ae69d259c/
l3networks/8748b8be922938bbb430ed9cbe3e4e46
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
l3Uuid	String	url	The L3 network UUID.		3.6.0

Name	Type	Location	Description	Optional Value	Starting Version
ruleSetUuid	String	url	The UUID of the policy rule set.		3.6.0
systemTags	List	body	Optional. The system tags.		3.6.0
userTags	List	body	Optional. The user tags.		3.6.0

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
AttachPolicyRouteRuleSetToL3Action action = new AttachPolicyRouteRuleSetToL3Action();
action.l3Uuid = "8748b8be922938bbb430ed9cbe3e4e46";
action.ruleSetUuid = "1e6eb259093e3fa2a30c837ae69d259c";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
AttachPolicyRouteRuleSetToL3Action.Result res = action.call();
```

Python SDK

```
AttachPolicyRouteRuleSetToL3Action action = AttachPolicyRouteRuleSetToL3Action()
action.l3Uuid = "8748b8be922938bbb430ed9cbe3e4e46"
action.ruleSetUuid = "1e6eb259093e3fa2a30c837ae69d259c"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
AttachPolicyRouteRuleSetToL3Action.Result res = action.call()
```

5.3.8.18 DetachPolicyRouteRuleSetFromL3

API Request

URLs

```
DELETE zstack/v1/policy-routes/rulesets/{ruleSetUuid}/l3networks/{l3Uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \

```

5.4.1.3 QueryNetworkServiceL3NetworkRef

API Request

URLs

```
GET zstack/v1/l3-networks/network-services/refs
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth aa530ebc39804e00b3df02b8862eaec3" \
-X GET http://localhost:8080/zstack/v1/l3-networks/network-services/
refs
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryNetworkServiceL3NetworkRef**, and pressing the **Tab** key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "l3NetworkUuid": "fc5bd613a8fd45ed9b96ff5d99ae6717",
      "networkServiceProviderUuid": "f79573afadc44f4fb83aaf67eeb98cde",
      "networkServiceType": "PortForwarding"
    }
  ]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventories	List	See inventories .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventories

Name	Type	Description	Starting Version
l3NetworkUuid	String	The L3 network UUID.	0.6
networkServiceProviderUuid	String	The network service provider UUID.	0.6
networkServiceType	String		0.6

SDK Sample

Java SDK

```
QueryNetworkServiceL3NetworkRefAction action = new QueryNetworkServiceL3NetworkRefAction();
action.conditions = asList();
action.sessionId = "01368722cb7e4c7eac03e7040f8b73e1";
```

```
QueryNetworkServiceL3NetworkRefAction.Result res = action.call();
```

Python SDK

```
QueryNetworkServiceL3NetworkRefAction action = QueryNetworkServiceL3NetworkRefAction()
action.conditions = []
action.sessionId = "237996a7dddf4cf3a42f6ea15893bc76"
QueryNetworkServiceL3NetworkRefAction.Result res = action.call()
```

5.4.1.4 AttachNetworkServiceToL3Network

API Request

URLs

```
POST zstack/v1/l3-networks/{l3NetworkUuid}/network-services
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "networkServices": {
      "95f60161f9d5483dbfe92a10d8795334": [
        "PortForwarding"
      ]
    }
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"networkServices":
{"41083a0985973a62bf8e6086dff0a2df":["PortForwarding"]}}}' \
http://localhost:8080/zstack/v1/l3-networks/
ae8e1e4d66003a08b748363b8ebb0be8/network-services
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
l3NetworkUuid	String	url	The L3 network UUID.		0.6
networkServices	Map	body (contained in the params structure)	The network services.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
AttachNetworkServiceToL3NetworkAction action = new AttachNetworkServiceToL3NetworkAction();
action.l3NetworkUuid = "e1a80b4d97ca442b8f313739de6d7997";
action.networkServices = [a3b86894e3b948288ccb1886a4084f03:[PortForwarding]];
action.sessionId = "4de1ca63ca1a4a0db7d799093b387c76";
AttachNetworkServiceToL3NetworkAction.Result res = action.call();
```

Python SDK

```
AttachNetworkServiceToL3NetworkAction action = AttachNetworkServiceToL3NetworkAction()
action.l3NetworkUuid = "38daee20c0264e41b58ea573c261f439"
action.networkServices = [7fb4f50bf7c74c30951fb7adbb202a95:[PortForwarding]]
action.sessionId = "4be26def099940f0979b1afaf414bba6"
```

```
AttachNetworkServiceToL3NetworkAction.Result res = action.call()
```

5.4.1.5 DetachNetworkServiceFromL3Network

API Request

URLs

```
DELETE/v1/l3-networks/{l3NetworkUuid}/network-services?networkServices={networkServices}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 6c324aa381644b8b87d229ba3fdad834" \
-X DELETE http://localhost:8080/zstack/v1/l3-networks/0cf8b1d49cb34d9c8f3fb0f70a4ec20d/network-services?networkServices.f
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
l3NetworkUuid	String	url	The L3 network UUID.		0.6
networkServices	Map	body	The network services.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DetachNetworkServiceFromL3NetworkAction action = new DetachNetworkServiceFromL3NetworkAction();
action.l3NetworkUuid = "ce1dedf370494cd4b49c1dd1c845c96b";
action.networkServices = [76b66ca373834d0e8f4011f84dbf6006:[PortForwarding, EIP]];
action.sessionId = "095d243ad49d4717b99b49c6151c25c8";
DetachNetworkServiceFromL3NetworkAction.Result res = action.call();
```

Python SDK

```
DetachNetworkServiceFromL3NetworkAction action = DetachNetworkServiceFromL3NetworkAction()
action.l3NetworkUuid = "a679835ba20342c5809e1be8ddf5e5c8"
action.networkServices = [b78e8e4ca36b4eefa5c38140c7611ef3:[PortForwarding, EIP]]
action.sessionId = "73aa0dad7996453f80331b833df6f320"
DetachNetworkServiceFromL3NetworkAction.Result res = action.call()
```

5.4.1.6 VPC Firewall Operations

5.4.1.6.1 CreateVpcFirewall

API Request

URLs

```
POST zstack/v1/vpcfirewalls
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "vpcUuid": "bc370cafacc83fad8f3ad583dea8da12",
    "description": "example-des",
    "name": "example-name"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"vpcUuid":"bc370cafacc83fad8f3ad583dea8da12", "description":"example-
des", "name":"example-name"}}' http://localhost:8080/zstack/v1/
vpcfirewalls
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vpcUuid	String	body (contained in the params structure)			3.6.0
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		3.6.0
name	String	body (contained in the params structure)	The resource name.		3.6.0
resourceUuid	String	body (contained in the params structure)	Optional.		3.6.0
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID list.		3.6.0
systemTags	List	body	Optional. The system tags.		3.6.0
userTags	List	body	Optional. The user tags.		3.6.0

API Response

Sample Response

```
{
  "inventory": {
    "name": "name",
    "refs": [
      {
        "id": 1.0,
        "ruleSetUuid": "06fc56b0483a3bf487b9cdfeaa6c4be2",

lastOpDate	Timestamp	The last operation date.	3.6.0
packetsForwardType	PacketsForwardType	See packetsForwardType .	3.6.0

#packetsForwardType

Name	Type	Description	Starting Version
in	PacketsForwardType		3.6.0
out	PacketsForwardType		3.6.0
local	PacketsForwardType		3.6.0

SDK Sample

Java SDK

```
RefreshFirewallAction action = new RefreshFirewallAction();
action.uuid = "f461b936af043aa89aa2bdeb221085e7";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
RefreshFirewallAction.Result res = action.call();
```

Python SDK

```
RefreshFirewallAction action = RefreshFirewallAction()
action.uuid = "f461b936af043aa89aa2bdeb221085e7"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
RefreshFirewallAction.Result res = action.call()
```

5.4.1.6.5 DeleteFirewall**API Request**

URLs

```
DELETE zstack/v1/vpcfirewalls/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X DELETE http://localhost:8080/zstack/v1/vpcfirewalls/09b37275fd073e4db292628ea260dd20?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.6.0
deleteMode	String	body	Optional. The delete mode.	• Permissive • Enforcing	4.0.0
systemTags	List	body	Optional. The system tags.		3.6.0
userTags	List	body	Optional. The user tags.		3.6.0

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteFirewallAction action = new DeleteFirewallAction();
action.uuid = "09b37275fd073e4db292628ea260dd20";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteFirewallAction.Result res = action.call();
```

Python SDK

```
DeleteFirewallAction action = DeleteFirewallAction()
action.uuid = "09b37275fd073e4db292628ea260dd20"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
DeleteFirewallAction.Result res = action.call()
```

5.4.1.6.6 CreateFirewallRuleSet

API Request

URLs

```
POST zstack/v1/vpcfirewalls/ruleSets
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "name",
    "actionType": "drop",
    "description": "example-des"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"name":"name","vpcFirewallUuid":"e9a77f42bdbb3b5692012c6007a5893a","actionType":
"des"}}' http://localhost:8080/zstack/v1/vpcfirewalls/ruleSets
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The ruleset name.		3.6.0
actionType	String	body (contained in	Optional. The action taken	- drop - accept	3.6.0

Name	Type	Location	Description	Optional Value	Starting Version
		the params structure)	against data packets.	reject	
description	String	body (contained in the params structure)	Optional. The detailed description of the ruleset.		3.6.0
resourceUuid	String	body (contained in the params structure)	Optional. The ruleset UUID.		3.6.0
tagUuids	List	body (contained in the params structure)	Optional. The tag UUIDs.		3.6.0
systemTags	List	body	Optional. The system tags.		3.6.0
userTags	List	body	Optional. The user tags.		3.6.0

API Response

Sample Response

```
{
  "inventory": {
    "name": "name",
    "actionType": "drop",
    "description": "example-des",
    "enableDefaultLog": false,
    "isDefault": false,
    "isApplied": true
  }
}
```

Name	Type	Description	Starting Version

SDK Sample

Java SDK

```
QueryFirewallRuleSetAction action = new QueryFirewallRuleSetAction();
action.conditions = asList();
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryFirewallRuleSetAction.Result res = action.call();
```

Python SDK

```
QueryFirewallRuleSetAction action = QueryFirewallRuleSetAction()
action.conditions = []
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
QueryFirewallRuleSetAction.Result res = action.call()
```

5.4.1.6.8 UpdateFirewallRuleSet

API Request

URLs

```
PUT zstack/v1/vpcfirewalls/ruleSets/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateFirewallRuleSet": {
    "description": "example-des",
    "actionType": "drop"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateFirewallRuleSet":{"description":"example-des","actionType":"drop"}}' http://localhost:8080/zstack/v1/vpcfirewalls/ruleSets/6b93eca80a9032c3a567b2e3af0f03db/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.6.0
name	String	body (contained in the updateFire	Optional. The resource name.		3.6.0

Name	Type	Location	Description	Optional Value	Starting Version
		wallRuleSet structure)			
description	String	body (contained in the updateFire wallRuleSet structure)	Optional. The detailed description of the resource.		3.6.0
actionType	String	body (contained in the updateFire wallRuleSet structure)	Optional. The action type.	• drop • accept • reject	3.6.0
systemTags	List	body	Optional. The system tags.		3.6.0
userTags	List	body	Optional. The user tags.		3.6.0

API Response

Sample Response

```
{

Name	Type	Description	Starting Version
disable	FirewallRuleState		3.6.0
enable	FirewallRuleState		3.6.0

SDK Sample

Java SDK

```
UpdateFirewallRuleSetAction action = new UpdateFirewallRuleSetAction
();
action.uuid = "6b93eca80a9032c3a567b2e3af0f03db";
action.description = "example-des";
action.actionType = "drop";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateFirewallRuleSetAction.Result res = action.call();
```

Python SDK

```
UpdateFirewallRuleSetAction action = UpdateFirewallRuleSetAction()
action.uuid = "6b93eca80a9032c3a567b2e3af0f03db"
action.description = "example-des"
action.actionType = "drop"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
UpdateFirewallRuleSetAction.Result res = action.call()
```

5.4.1.6.9 DeleteFirewallRules

API Request

URLs

```
DELETE zstack/v1/vpcfirewalls/ruleSets/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/vpcfirewalls/
ruleSets/62b6ef32f6573f01929c5020d976bd66?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.6.0
deleteMode	String	body	Optional. The delete mode.	• Permissive • Enforcing	4.0.0
systemTags	List	body	Optional. The system tags.		3.6.0
userTags	List	body	Optional. The user tags.		3.6.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DeleteFirewallRuleSetAction action = new DeleteFirewallRuleSetAction
();
action.uuid = "62b6ef32f6573f01929c5020d976bd66";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteFirewallRuleSetAction.Result res = action.call();
```

Python SDK

```
DeleteFirewallRuleSetAction action = DeleteFirewallRuleSetAction()
action.uuid = "62b6ef32f6573f01929c5020d976bd66"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteFirewallRuleSetAction.Result res = action.call()
```

5.4.1.6.10 AttachFirewallRuleSetToL3

API Request

URLs

```
POST zstack/v1/vpcfirewalls/ruleSets/{ruleSetUuid}/l3networks/{l3Uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "vpcFirewallUuid": "d5a0a7ce8bdf315a87189bb3f1c12f98",
    "forward": "in"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X POST -d '{"params":
{"vpcFirewallUuid":"d5a0a7ce8bdf315a87189bb3f1c12f98","forward":"in"}}'

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
ruleSetUuid	String	body (contained in the params structure)	The ruleset UUID.		3.6.0
action	String	body (contained in the params structure)	The action taken against data packets.	• drop • accept • reject	3.6.0
protocol	String	body (contained in the params structure)	Optional. The protocol.		3.6.0
destPort	String	body (contained in the params structure)	Optional. The destination port.		3.6.0
sourcePort	String	body (contained in the params structure)	Optional. The source port.		3.6.0

Name	Type	Location	Description	Optional Value	Starting Version
sourceIp	String	body (contained in the params structure)	Optional. The source IP address.		3.6.0
destIp	String	body (contained in the params structure)	Optional. The destination IP address.		3.6.0
allowStates	String	body (contained in the params structure)	Optional. The allow status of packets.		3.6.0
tcpFlag	String	body (contained in the params structure)	Optional. The TCP flag.		3.6.0
icmpTypeName	String	body (contained in the params structure)	Optional. The ICMP type.		3.6.0
ruleNumber	Integer	body (contained in the params structure)	The priority of the rule.		3.6.0
enableLog	boolean	body (contained in the params structure)	Optional. Specifies whether to enable logging.		3.6.0
state	String	body (contained in the params structure)	The action that changes the state of the rule.	• enable • disable	3.6.0
description	String	body (contained in the params structure)	Optional. The detailed description of the rule.		3.6.0

Name	Type	Location	Description	Optional Value	Starting Version
resourceUuid	String	body (contained in the params structure)	Optional. The rule UUID.		3.6.0
tagUuids	List	body (contained in the params structure)	Optional. The tag UUIDs.		3.6.0
systemTags	List	body	Optional. The system tags.		3.6.0
userTags	List	body	Optional. The user tags.		3.6.0

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
ruleInfo	String	body (contained in the params structure)	The firewall rule information.		4.4.0
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		4.4.0
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID.		4.4.0
systemTags	List	body	Optional. The system tags.		4.4.0
userTags	List	body	Optional. The user tags.		4.4.0

API Response

Sample Response

```
{
  "inventory": [
    {
      "name": "name",
      "actionType": "drop",
      "description": "example-des",
      "enableDefaultLog": false,
      "isDefault": false,
      "isApplied": true
    }
  ]
}
```

Name	Type	Description	Starting Version
success	boolean		4.4.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.4.0

Name	Type	Description	Starting Version
inventory	VpcFirewallRuleSetInventory	See inventory .	4.4.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.4.0
description	String	The brief description of the error.	4.4.0
details	String	The details about the error.	4.4.0
elaboration	String	The reserved field. Default value: null.	4.4.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.4.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.4.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	4.4.0
name	String	The resource name.	4.4.0
description	String	The detailed description of the resource.	4.4.0
isDefault	boolean		4.4.0
isApplied	boolean		4.4.0
createDate	Timestamp	The creation time.	4.4.0

Name	Type	Description	Starting Version
lastOpDate	Timestamp	The last operation time	4.4.0
actionType	ActionType	See actionType .	4.4.0

#actionType

Name	Type	Description	Starting Version
drop	ActionType		4.4.0
reject	ActionType		4.4.0
accept	ActionType		4.4.0

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
ruleSetUuid	String	body (contained in the updateFirewallRule structure)	The ruleset UUID.		3.6.0
uuid	String	url	The rule UUID.		3.6.0
action	String	body (contained in the updateFirewallRule structure)	The action taken against data packets.	• drop • reject • accept	3.6.0
protocol	String	body (contained in the updateFirewallRule structure)	Optional. The protocol.		3.6.0
destPort	String	body (contained in the	Optional. The destination port.		3.6.0

Name	Type	Location	Description	Optional Value	Starting Version
		updateFire wallRule structure)			
sourcePort	String	body (contained in the updateFire wallRule structure)	Optional. The source port.		3.6.0
sourceIp	String	body (contained in the updateFire wallRule structure)	Optional. The source IP address.		3.6.0
destIp	String	body (contained in the updateFire wallRule structure)	Optional. The destination IP address.		3.6.0
allowStates	String	body (contained in the updateFire wallRule structure)	Optional. The allow status of packets.		3.6.0
tcpFlag	String	body (contained in the updateFire wallRule structure)	Optional. The TCP flag.		3.6.0
icmpTypeName	String	body (contained in the updateFire	Optional. The ICMP type.		3.6.0

Name	Type	Location	Description	Optional Value	Starting Version
		wallRule structure)			
ruleNumber	Integer	body (contained in the updateFire wallRule structure)	The priority of the rule.		3.6.0
enableLog	boolean	body (contained in the updateFire wallRule structure)	Optional. Specifies whether to enable logging .		3.6.0
state	String	body (contained in the updateFire wallRule structure)	The action that changes the state of the rule.	• enable • disable	3.6.0
description	String	body (contained in the updateFire wallRule structure)	Optional. The detailed description of the rule.		3.6.0
systemTags	List	body	Optional. The system tags.		3.6.0
userTags	List	body	Optional. The user tags.		3.6.0

Name	Type	Description	Starting Version
disable	FirewallRuleState		3.6.0
enable	FirewallRuleState		3.6.0

SDK Sample

Java SDK

```
UpdateFirewallRuleAction action = new UpdateFirewallRuleAction();
action.ruleSetUuid = "c7b605d7c7e037f8b4df43bfe5a26d0f";
action.uuid = "7e9bd2ad1f48320d8782d737b262abb1";
action.action = "accept";
action.protocol = "tcp";
action.destPort = "22";
action.sourcePort = "22";
action.sourceIp = "192.168.1.2";
action.destIp = "192.168.1.1";
action.allowStates = "invalid,new";
action.tcpFlag = "SYN";
action.icmpTypeName = "echo-reply";
action.ruleNumber = 1001.0;
action.enableLog = false;
action.state = "disable";
action.description = "example rule des";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateFirewallRuleAction.Result res = action.call();
```

Python SDK

```
UpdateFirewallRuleAction action = UpdateFirewallRuleAction()
action.ruleSetUuid = "c7b605d7c7e037f8b4df43bfe5a26d0f"
action.uuid = "7e9bd2ad1f48320d8782d737b262abb1"
action.action = "accept"
action.protocol = "tcp"
action.destPort = "22"
action.sourcePort = "22"
action.sourceIp = "192.168.1.2"
action.destIp = "192.168.1.1"
action.allowStates = "invalid,new"
action.tcpFlag = "SYN"
action.icmpTypeName = "echo-reply"
action.ruleNumber = 1001.0
action.enableLog = false
action.state = "disable"
action.description = "example rule des"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
UpdateFirewallRuleAction.Result res = action.call()
```

5.4.1.6.17 DeleteFirewallRule

API Request

URLs

```
DELETE zstack/v1/vpcfirewalls/rules/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/vpcfirewalls/
rules/6238605440b535dd9f7d5d033a732659?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.6.0
deleteMode	String	body	Optional. The delete mode.	• Permissive • Enforcing	4.0.0
systemTags	List	body	Optional. The system tags.		3.6.0
userTags	List	body	Optional. The user tags.		3.6.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DeleteFirewallRuleAction action = new DeleteFirewallRuleAction();
action.uuid = "6238605440b535dd9f7d5d033a732659";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteFirewallRuleAction.Result res = action.call();
```

Python SDK

```
DeleteFirewallRuleAction action = DeleteFirewallRuleAction()
action.uuid = "6238605440b535dd9f7d5d033a732659"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteFirewallRuleAction.Result res = action.call()
```

5.4.1.6.18 ChangeFirewallRuleState

API Request

URLs

```
PUT zstack/v1/vpcfirewalls/rules/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeFirewallRuleState": {
    "state": "disable"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X PUT -d '{"changeFirewallRuleState":{"state":"disable"}}'
http://localhost:8080/zstack/v1/vpcfirewalls/
rules/4eef3024e5bd36f38be22b5af9807b20/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.6.0
state	String	body (contained in the changeFirewallRuleState structure)	The action to change the state of the firewall rule.	• enable • disable	3.6.0
systemTags	List	body	Optional. The system tags.		3.6.0
userTags	List	body	Optional. The user tags.		3.6.0

API Response

Sample Response

```
{
  "inventory": {
    "ruleSetUuid": "387ccd99cb2b3374a24f86108c3b8653",
    "action": "accept",

SDK Sample

Java SDK

```
CreateFirewallRuleTemplateAction action = new CreateFirewallRuleTemplateAction();
action.action = "accept";
action.protocol = "tcp";
action.name = "rule-template";
action.destPort = "22";
action.sourcePort = "22";
action.sourceIp = "192.168.1.2";
action.destIp = "192.168.1.1";
action.allowStates = "invalid,new";
action.tcpFlag = "SYN";
action.icmpTypeName = "echo-reply";
action.ruleNumber = 1001.0;
action.enableLog = false;
action.state = "disable";
action.description = "example rule des";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateFirewallRuleTemplateAction.Result res = action.call();
```

Python SDK

```
CreateFirewallRuleTemplateAction action = CreateFirewallRuleTemplateAction()
action.action = "accept"
action.protocol = "tcp"
action.name = "rule-template"
action.destPort = "22"
action.sourcePort = "22"
action.sourceIp = "192.168.1.2"
action.destIp = "192.168.1.1"
action.allowStates = "invalid,new"
action.tcpFlag = "SYN"
action.icmpTypeName = "echo-reply"
action.ruleNumber = 1001.0
action.enableLog = false
action.state = "disable"
action.description = "example rule des"
```

```
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CreateFirewallRuleTemplateAction.Result res = action.call()
```

5.4.1.6.21 DeleteFirewallRuleTemplate

API Request

URLs

```
DELETE zstack/v1/vpcfirewalls/ipset/templates/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/vpcfirewalls/rules/
templates/8de197dab6af3e30b7131bc6d50f935d?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
uuid	String	url	The UUID of the rule template.		4.0.0
deleteMode	String	body	Optional. The deletion mode.	• Permissive • Enforcing	4.0.0
systemTags	List	body	Optional. The system tags.		4.0.0
userTags	List	body	Optional. The user tags.		4.0.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DeleteFirewallRuleTemplateAction action = new DeleteFirewallRuleTemplateAction();
action.uuid = "8de197dab6af3e30b7131bc6d50f935d";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteFirewallRuleTemplateAction.Result res = action.call();
```

Python SDK

```
DeleteFirewallRuleTemplateAction action = DeleteFirewallRuleTemplateAction()
action.uuid = "8de197dab6af3e30b7131bc6d50f935d"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteFirewallRuleTemplateAction.Result res = action.call()
```

5.4.1.6.22 UpdateFirewallRuleTemplate

API Request

URLs

```
PUT zstack/v1/vpcfirewalls/rules/template/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateFirewallRuleTemplate": {
    "name": "rule-template-name",
    "action": "accept",
    "protocol": "tcp",
    "destPort": "22",
    "sourcePort": "22",
    "sourceIp": "192.168.1.2",
    "destIp": "192.168.1.1",
    "allowStates": "invalid,new",
    "tcpFlag": "SYN",
    "icmpTypeName": "echo-reply",
    "ruleNumber": 1001.0,
    "enableLog": false,
    "state": "disable",
    "description": "example rule des"
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateFirewallRuleTemplate":{"name":"rule-template-name","action":"accept","protocol":"tcp","destPort":"22","sourcePort":"22","sourceReply","ruleNumber":1001.0,"enableLog":false,"state":"disable","description":"example rule des"}}' http://localhost:8080/zstack/v1/vpcfirewalls/rules/template/0e85a35457763de9bc0a4d19d15e4630/actions
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
uuid	String	url	The UUID of the template.		4.0.0
name	String	body (contained in the updateFirewallRuleTemplate structure)	Optional. The name of the rule template.		4.0.0
action	String	body (contained in the updateFirewallRuleTemplate structure)		- drop - reject - accept	4.0.0
protocol	String	body (contained in the updateFirewallRuleTemplate structure)	Optional.		4.0.0
destPort	String	body (contained in the updateFire	Optional.		4.0.0

Name	Type	Location	Description	Valid Value	Starting Version
		wallRuleTemplate structure)			
sourcePort	String	body (contained in the updateFirewallRuleTemplate structure)	Optional.		4.0.0
sourceIp	String	body (contained in the updateFirewallRuleTemplate structure)	Optional.		4.0.0
destIp	String	body (contained in the updateFirewallRuleTemplate structure)	Optional.		4.0.0
allowStates	String	body (contained in the updateFirewallRuleTemplate structure)	Optional.		4.0.0
tcpFlag	String	body (contained in the updateFirewallRuleTemplate structure)	Optional.		4.0.0
icmpTypeName	String	body (contained in the updateFirewallRuleTemplate structure)	Optional.		4.0.0

Name	Type	Location	Description	Valid Value	Starting Version
		mplate structure)			
ruleNumber	Integer	body (contained in the updateFire wallRuleTe mplate structure)			4.0.0
enableLog	boolean	body (contained in the updateFire wallRuleTe mplate structure)	Optional.		4.0.0
state	String	body (contained in the updateFire wallRuleTe mplate structure)	Optional.		4.0.0
description	String	body (contained in the updateFire wallRuleTe mplate structure)	Optional. The detailed description of the template.		4.0.0
resourceUuid	String	body (contained in the updateFire wallRuleTe mplate structure)	Optional. The UUID of the template.		4.0.0
tagUuids	List	body (contained in the updateFire wallRuleTe mplate structure)	Optional. The tag tags.		4.0.0

Name	Type	Location	Description	Valid Value	Starting Version
systemTags	List	body	Optional. The system tags.		4.0.0
userTags	List	body	Optional. The user tags.		4.0.0

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.6.0
description	String	The brief description of the error.	3.6.0
details	String	The details about the error.	3.6.0
elaboration	String	The reserved field. Default value: null.	3.6.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.6.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.6.0

#inventories

Name	Type	Description	Starting Version
id	long		3.6.0
vpcFirewallUuid	String		3.6.0
vRouterUuid	String		3.6.0
createDate	Timestamp	The creation date.	3.6.0
lastOpDate	Timestamp	The last operation date.	3.6.0

SDK Sample

Java SDK

```
QueryVpcFirewallVRouterRefAction action = new QueryVpcFirewallVRouterRefAction();
action.conditions = asList();
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryVpcFirewallVRouterRefAction.Result res = action.call();
```

Python SDK

```
QueryVpcFirewallVRouterRefAction action = QueryVpcFirewallVRouterRefAction()
action.conditions = []
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryVpcFirewallVRouterRefAction.Result res = action.call()
```

5.4.1.6.25 ApplyRuleSetChanges

API Request

URLs

```
PUT zstack/v1/vpcfirewalls/ruleSets/apply/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "applyRuleSetChanges": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"applyRuleSetChanges":{}}' http://localhost:8080/zstack/
v1/vpcfirewalls/ruleSets/apply/e78b0b5ebe1c33159b0faa2d88a41b21/
actions
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
uuid	String	url	The UUID of the action.		4.0.0
systemTags	List	body	Optional.		4.0.0
userTags	List	body	Optional.		4.0.0

API Response

Sample Response

```
{
  "inventory": {
    "name": "name",
    "actionType": "drop",
    "description": "example-des",
    "enableDefaultLog": false,
    "isDefault": false,
    "isApplied": true
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error	4.0.0
inventory	VpcFirewallRuleSetInventory	See inventory	4.0.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.0.0
description	String	The brief description of the error.	4.0.0
details	String	The details about the error.	4.0.0
elaboration	String	The reserved field. Default value: null.	4.0.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.0.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.0.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The UUID of the VPC firewall ruleset.	4.0.0
name	String	The name of the VPC firewall ruleset.	4.0.0
description	String	The detailed description of the VPC firewall ruleset.	4.0.0
isDefault	boolean		4.0.0
isApplied	boolean		4.0.0
createDate	Timestamp	The time when the VPC firewall ruleset was created.	4.0.0

Name	Type	Description	Starting Version
lastOpDate	Timestamp	The time when the VPC firewall ruleset was last modified.	4.0.0
actionType	ActionType	See actionType	4.0.0

#actionType

Name	Type	Description	Starting Version
drop	ActionType		4.0.0
reject	ActionType		4.0.0
accept	ActionType		4.0.0

SDK Sample

Java SDK

```
ApplyRuleSetChangesAction action = new ApplyRuleSetChangesAction();
action.uuid = "e78b0b5ebe1c33159b0faa2d88a41b21";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
ApplyRuleSetChangesAction.Result res = action.call();
```

Python SDK

```
ApplyRuleSetChangesAction action = ApplyRuleSetChangesAction()
action.uuid = "e78b0b5ebe1c33159b0faa2d88a41b21"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
ApplyRuleSetChangesAction.Result res = action.call()
```

5.4.1.6.26 CreateFirewallIpSetTemplate

API Request

URLs

```
POST zstack/v1/vpcfirewalls/ipset/templates
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "ipset-template",
    "sourceValue": "192.168.1.2",
```

```

    "destValue": "192.168.1.1,10.0.0.1/24",
    "type": "ip"
  },
  "systemTags": [],
  "userTags": []
}

```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"name":"ipset-template","sourceValue":"192.168.1.2","destValue":"192.168.1.1,10.0.0.1/24","type":
http://localhost:8080/zstack/v1/vpcfirewalls/ipset/templates

```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
name	String	body (contained in the params structure)	The name of the template.		4.0.0
sourceValue	String	body (contained in the params structure)	Optional.		4.0.0
destValue	String	body (contained in the params structure)	Optional.		4.0.0
type	IpSetType	body (contained in the params structure)		- ip - port	4.0.0
resourceUuid	String	body (contained in the params structure)	Optional. The UUID of the template.		4.0.0

Name	Type	Location	Description	Valid Value	Starting Version
tagUuids	List	body (contained in the params structure)	Optional. The user tags.		4.0.0
systemTags	List	body	Optional. The system tags.		4.0.0
userTags	List	body	Optional. The user tags.		4.0.0

API Response

Sample Response

```
{
  "inventory": {
    "name": "ipset-template",
    "sourceValue": "192.168.1.2",
    "destValue": "192.168.1.1,10.0.0.1/24",
    "type": "ip"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error	4.0.0
inventory	VpcFirewallIpSetTemplateInventory	See inventory	4.0.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.0.0

Name	Type	Description	Starting Version
description	String	The brief description of the error.	4.0.0
details	String	The details about the error.	4.0.0
elaboration	String	The reserved field. Default value: null.	4.0.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.0.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.0.0

#inventory

Name	Type	Description	Starting Version
name	String	The name of the template.	4.0.0
sourceValue	String		4.0.0
destValue	String		4.0.0
createDate	Timestamp	The time when the template was created.	4.0.0
lastOpDate	Timestamp	The time when the template was last modified.	4.0.0
accountUuid	String	The account UUID.	4.0.0
uuid	String	The template UUID.	4.0.0
type	IpSetType	See type	4.0.0

#type

Name	Type	Description	Starting Version
ip	IpSetType		4.0.0
port	IpSetType		4.0.0

SDK Sample

Java SDK

```
CreateFirewallIpSetTemplateAction action = new CreateFirewallIpSetTemplateAction();
action.name = "ipset-template";
action.sourceValue = "192.168.1.2";
action.destValue = "192.168.1.1,10.0.0.1/24";
action.type = "ip";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateFirewallIpSetTemplateAction.Result res = action.call();
```

Python SDK

```
CreateFirewallIpSetTemplateAction action = CreateFirewallIpSetTemplateAction()
action.name = "ipset-template"
action.sourceValue = "192.168.1.2"
action.destValue = "192.168.1.1,10.0.0.1/24"
action.type = "ip"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CreateFirewallIpSetTemplateAction.Result res = action.call()
```

5.4.1.6.27 DeleteFirewallIpSetTemplate

API Request

URLs

```
DELETE /v1/vpcfirewalls/ipset/templates/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/vpcfirewalls/ipset/templates/e84fbe6b5a9c31a1b4b83cfde4028893?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
uuid	String	url	The UUID of the template.		4.0.0
deleteMode	String	body	Optional. The deletion mode.	Permissive	4.0.0

Name	Type	Location	Description	Valid Value	Starting Version
				Enforcing	
Optional. The system tags.	List	body	Optional. The system tags.		4.0.0
Optional. The user tags.	List	body	Optional. The user tags.		4.0.0

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteFirewallIpSetTemplateAction action = new DeleteFirewallIpSetTemplateAction();
action.uuid = "e84fbe6b5a9c31a1b4b83cfde4028893";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteFirewallIpSetTemplateAction.Result res = action.call();
```

Python SDK

```
DeleteFirewallIpSetTemplateAction action = DeleteFirewallIpSetTemplateAction()
action.uuid = "e84fbe6b5a9c31a1b4b83cfde4028893"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
DeleteFirewallIpSetTemplateAction.Result res = action.call()
```

5.4.1.6.28 UpdateFirewallIpSetTemplate

API Request

URLs

```
PUT zstack/v1/vpcfirewalls/ipset/templates/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateFirewallIpSetTemplate": {
    "name": "ipset-template",
    "sourceValue": "192.168.1.2",
    "destValue": "192.168.1.1,10.0.0.1/24",
    "type": "ip"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateFirewallIpSetTemplate":{"name":"ipset-template","sourceValue":"192.168.1.2","destValue":"192.168.1.1,10.0.0.1/24","type":"ip"},"systemTags":[],"userTags":[]}' \
http://localhost:8080/zstack/v1/vpcfirewalls/ipset/templates/c7df801f021e334f9d548eac2eb2cd47/actions
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
uuid	String	url	The UUID of the template.		4.0.0

Name	Type	Location	Description	Valid Value	Starting Version
name	String	body (contained in the updateFirewallIpSetTemplate structure)	Optional. The name of the template.		4.0.0
sourceValue	String	body (contained in the updateFirewallIpSetTemplate structure)	Optional.		4.0.0
destValue	String	body (contained in the updateFirewallIpSetTemplate structure)	Optional.		4.0.0
type	IpSetType	body (contained in the updateFirewallIpSetTemplate structure)		- ip - port	4.0.0
systemTags	List	body	Optional. The system tags.		4.0.0
userTags	List	body	Optional. The user tags.		4.0.0

API Response

Sample Response

```
{
  "inventory": {
    "name": "ipset-template",
```

```

    "sourceValue": "192.168.1.2",
    "destValue": "192.168.1.1,10.0.0.1/24",
    "type": "ip"
  }
}

```

5.4.1.7 Security Group Operations

5.4.1.7.1 CreateSecurityGroup

API Request

URLs

```
POST zstack/v1/security-groups
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "sp",
    "description": "test create security group"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"name":"sp","description":"test create security group"}}' \
http://localhost:8080/zstack/v1/security-groups
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The resource name.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		0.6
ipVersion	Integer	body (contained in the params structure)	Optional. The IP version.	• 4 • 6	3.1.0
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID. If specified, the system will not allocate randomly a UUID to the resource.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "7bb070cdebf44fd8af354f25344d758b",
    "name": "web",

```

```
action.sessionId = "e34f8139af4548d5ade539ca2a5d7983"
CreateSecurityGroupAction.Result res = action.call()
```

5.4.1.7.2 DeleteSecurityGroup

API Request

URLs

```
DELETE zstack/v1/security-groups/{uuid}?deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 6674ae438b8646d3b4a99a7fe7a48719" \
-X DELETE http://localhost:8080/zstack/v1/security-
groups/6791f54e4fb147d1b26030723efe03bd?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
deleteMode	String	body	Optional. The delete mode. Options: Permissive Enforcing. Default mode: Permissive. Permissive: If an error occurs, or if the delete operation is refused, ZStack Cloud will stop the delete operation.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
			In this mode, an error code that contains the failure reason will be returned. Enforcing: ZStack Cloud will ignore all errors and permissions to delete directly the resource. In this mode, the delete operation will always succeed.		
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DeleteSecurityGroupAction action = new DeleteSecurityGroupAction();
action.uuid = "86efff16586b4d82bfea66deba85cc50";
action.deleteMode = "Permissive";
action.sessionId = "079653952584401b997df37fd7044433";
DeleteSecurityGroupAction.Result res = action.call();
```

Python SDK

```
DeleteSecurityGroupAction action = DeleteSecurityGroupAction()
action.uuid = "59098134c4214c79a48ced0ed7952ecd"
action.deleteMode = "Permissive"
action.sessionId = "2fb58330c68d46f6aa700740d52b02c0"
DeleteSecurityGroupAction.Result res = action.call()
```

5.4.1.7.3 QuerySecurityGroup

API Request

URLs

```
GET zstack/v1/security-groups
GET zstack/v1/security-groups/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 1f3fcf6a885148b69702e52d22de9606" \
-X GET http://localhost:8080/zstack/v1/security-groups?
q=name=web&q=state=Enabled
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth a0c4c995a9e34c639cc72732bcd7bd2f" \
-X GET http://localhost:8080/zstack/v1/security-groups/
af0d90237c084afaa16f997847579152
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QuerySecurityGroup`, and pressing the **Tab** key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "uuid": "6f757e65fed243babeac0be896e77caf",
      "name": "web",
      "description": "for test",
      "state": "Enabled",
      "createDate": "Jun 7, 2017 9:20:34 PM",
      "lastOpDate": "Jun 7, 2017 9:20:34 PM",
      "internalId": 0.0
    }
  ]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventories	List	See inventories .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6

SDK Sample

Java SDK

```
QuerySecurityGroupAction action = new QuerySecurityGroupAction();
action.conditions = asList("name=web", "state=Enabled");
action.sessionId = "604cf540e620468fa3fad7098196bb96";
QuerySecurityGroupAction.Result res = action.call();
```

Python SDK

```
QuerySecurityGroupAction action = QuerySecurityGroupAction()
action.conditions = ["name=web", "state=Enabled"]
action.sessionId = "55a3657d35f14ee4b41401bd7ada15a7"
QuerySecurityGroupAction.Result res = action.call()
```

5.4.1.7.4 UpdateSecurityGroup

API Request

URLs

```
PUT zstack/v1/security-groups/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateSecurityGroup": {
    "name": "new sg",
    "description": "for test update"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateSecurityGroup":{"name":"new sg","description":"for test update"}}' \
http://localhost:8080/zstack/v1/security-groups/549bb03c235a3fa8aa18fb79539d4862/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
name	String	body (contained in the updateSecurityGroup structure)	Optional. The resource name.		0.6
description	String	body (contained in the updateSecurityGroup structure)	Optional. The detailed description of the resource.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```

action.sessionId = "933ada040fb14b94941997381877bacc"
DetachSecurityGroupFromL3NetworkAction.Result res = action.call()
```

5.4.1.7.8 GetCandidateVmNicForSecurityGroup

API Request

URLs

```
GET zstack/v1/security-groups/{securityGroupUuid}/vm-instances/
candidate-nics
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth aec584233a724de089d05b8090e5a296" \
-X GET http://localhost:8080/zstack/v1/security-
groups/584e70f6d3504c7a811df5eeba61839c/vm-instances/candidate-nics
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
securityGroupUuid	String	url	The security group UUID.		0.6
systemTags	List	query	Optional. The system tags.		0.6
userTags	List	query	Optional. The user tags.		0.6

API Response

Sample Response

```

SDK Sample

Java SDK

```
GetCandidateVmNicForSecurityGroupAction action = new GetCandidateVmNicForSecurityGroupAction();
action.securityGroupUuid = "4060760487504ea3b1ad25bcbabacff5";
action.sessionId = "488b3f4cc8ea4868ab0a7874c4d6358e";
GetCandidateVmNicForSecurityGroupAction.Result res = action.call();
```

Python SDK

```
GetCandidateVmNicForSecurityGroupAction action = GetCandidateVmNicForSecurityGroupAction()
action.securityGroupUuid = "c30e353b2fe0408ca3ee09a5495b5fa4"
action.sessionId = "acaa2edf939e47b1a399b413f6b26400"
GetCandidateVmNicForSecurityGroupAction.Result res = action.call()
```

5.4.1.7.9 AddVmNicToSecurityGroup

API Request

URLs

```
POST zstack/v1/security-groups/{securityGroupUuid}/vm-instances/nics
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
```

```

"params": {
  "vmNicUuids": [
    "8432b2608a8a4f639cc56a8c65ee42ef"
  ],
},
"systemTags": [],
"userTags": []
}

```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"vmNicUuids":
["c37875cec7133f41adbeb336cdd33ef8"]}}' \
http://localhost:8080/zstack/v1/security-groups/
f52566f939f635629a43cd3e27f78dd9/vm-instances/nics

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
securityGroupUuid	String	url	The security group UUID.		0.6
vmNicUuids	List	body (contained in the params structure)	The VM NIC UUID list.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```

{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}

```

```
}
}
```

SDK Sample

Java SDK

```
AddVmNicToSecurityGroupAction action = new AddVmNicToSecurityGroupAction();
action.securityGroupUuid = "b651075ffcac475c91d3edaa5e9ade75";
action.vmNicUuids = asList("ff0f6c13311b46ddb186a95c0d18350a");
action.sessionId = "605fca0559284eff95d78e418508ff2f";
AddVmNicToSecurityGroupAction.Result res = action.call();
```

Python SDK

```
AddVmNicToSecurityGroupAction action = AddVmNicToSecurityGroupAction()
action.securityGroupUuid = "2da1519b9b39451e8742aadaa9241952"
action.vmNicUuids = [bda4ceec2917426cb9ee20b3bcb20653]
action.sessionId = "863d503abfbc4334846d67c1eac375f9"
AddVmNicToSecurityGroupAction.Result res = action.call()
```

5.4.1.7.10 DeleteVmNicFromSecurityGroup

API Request

URLs

```
DELETE /v1/security-groups/{securityGroupUuid}/vm-instances/nics?
vmNicUuids={vmNicUuids}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/security-
groups/2c78da48235c3015aa9f9c99e81060b2/vm-instances/nics?
vmNicUuids=9aef4c831b1540e7832332972138d78c&vmNicUuids=c40dd02ddf654031aec2534662
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
securityGroupUuid	String	url	The security group UUID.		0.6
vmNicUuids	List	body	The VM NIC UUID list.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteVmNicFromSecurityGroupAction action = new DeleteVmNicFromSecurityGroupAction();
action.securityGroupUuid = "2c78da48235c3015aa9f9c99e81060b2";
action.vmNicUuids = asList("f8e9c3a73e7c399ca148057f8b2897c3", "ae09cd7292913bfe84e467286aaa7a9f");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteVmNicFromSecurityGroupAction.Result res = action.call();
```

Python SDK

```
DeleteVmNicFromSecurityGroupAction action = DeleteVmNicFromSecurityGroupAction()
action.securityGroupUuid = "2c78da48235c3015aa9f9c99e81060b2"
action.vmNicUuids = [f8e9c3a73e7c399ca148057f8b2897c3, ae09cd7292913bfe84e467286aaa7a9f]

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
securityGroupUuid	String	url	The security group UUID.		4.7.21
type	String	query	The type of the security group rule.	- Ingress - Egress	4.7.21
protocol	String	query	The protocol of the security group rule.	- TCP - UDP - ICMP - ALL	4.7.21
remoteSecurityGroupUuid	String	query	Optional. The remote security group UUID.		4.7.21
ipVersion	Integer	query	Optional. The IP version of the security group rule.	4 6	4.7.21

Name	Type	Location	Description	Optional Value	Starting Version
srcIpRange	String	query	Optional. The range of the source IP of the security group rule.		4.7.21
dstIpRange	String	query	Optional. The range of the target IP of the security group rule.		4.7.21
dstPortRange	String	query	Optional. The range of the target port of the security group rule.		4.7.21
action	String	query	Optional. The default action of the security group rule.	• ACCEPT • DROP	4.7.21
startPort	Integer	query	Optional. The startport of the security group rule.		4.7.21
endPort	Integer	query	Optional. The endpoint of the security group rule.		4.7.21
allowedCidr	String	query	Optional. The range of IP version of the security group rule.		4.7.21
systemTags	List	body	Optional. The system tags.		4.7.21
userTags	List	body	Optional. The user tags.		4.7.21

API Response

Response Sample

```
{
  "available": true,
  "code": "SG.2000"
}
```

Name	Type	Description	Starting Version
available	boolean	Whether the rule is valid.	4.7.21
code	String	The error code of the rule.	4.7.21
reason	String	reason	4.7.21
success	boolean		4.7.21
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.7.21

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	4.7.21
description	String	The brief description of the error.	4.7.21
details	String	The details about the error.	4.7.21
elaboration	String	The reserved field. Default value: null.	4.7.21
opaque	LinkedHashMap	The reserved field. Default value: null.	4.7.21

Name	Type	Description	Starting Version
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.7.21

```

```

    "name": "test",
    "internalId": 0
  }
}

```

Name	Type	Description	Starting Version
success	boolean		4.7.21
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.7.21
inventory	SecurityGroupInventory	See inventory .	4.7.21

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.7.21
description	String	The brief description of the error.	4.7.21
details	String	The details about the error.	4.7.21
elaboration	String	The reserved field. Default value: null.	4.7.21
opaque	LinkedHashMap	The reserved field. Default value: null.	4.7.21
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.7.21

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	4.7.21
name	String	The resource name.	4.7.21
description	String	The detailed description of the resource.	4.7.21
state	String		4.7.21
ipVersion	Integer	The IP version.	4.7.21
createDate	Timestamp	The creation date.	4.7.21
lastOpDate	Timestamp	The last operation date.	4.7.21
attachedL3NetworkUuids	Set		4.7.21
rules	List	See rules .	4.7.21

#rules

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	4.7.21
securityGroupUuid	String	The security group UUID.	4.7.21
type	String	The traffic type.	4.7.21
ipVersion	Integer	The IP version.	4.7.21
protocol	String	The traffic protocol type.	4.7.21
state	String	The rule state.	4.7.21
priority	Integer	The rule priority.	4.7.21
description	String	The description of the rule.	4.7.21
srcIpRange	String	The range of the source IP of the rule.	4.7.21
dstIpRange	String	The range of the target IP of the rule.	4.7.21
srcPortRange	String	The range of the source port of the rule, which is not	4.7.21

Name	Type	Description	Starting Version
		implemented in the current version.	
dstPortRange	String	The range of the target port of the rule.	4.7.21
action	String	The default action of the rule.	4.7.21
remoteSecurityGroupUuid	String		4.7.21
allowedCidr	String	- The allowed CIDR, which has different meanings according to different traffic types. - If the traffic type is Ingress, the allowed CIDR is a source CIDR that is allowed to access VM NICs. - If the traffic type is Egress, the allowed CIDR is a destination CIDR that is allowed to leave from VM NICs.	4.7.21
startPort	Integer	- If the protocol is TCP or UDP, this parameter is the start port of the port range. - If the protocol is ICMP, this parameter is the ICMP type.	4.7.21
endPort	Integer	If the protocol is TCP or UDP, this	4.7.21

Name	Type	Description	Starting Version
		parameter is the end port of the port range. If the protocol is ICMP, this parameter is the ICMP type.	
createDate	Timestamp	The creation date.	4.7.21
lastOpDate	Timestamp	The last operation date.	4.7.21

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
deleteMode	String	body	Optional. The delete mode.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteVipAction action = new DeleteVipAction();
action.uuid = "8da4c26b4089423f93cbce8ab804f9e9";
action.deleteMode = "Permissive";
action.sessionId = "772f7846b7c24d9b933deb8b03fc3024";
DeleteVipAction.Result res = action.call();
```

Python SDK

```
DeleteVipAction action = DeleteVipAction()
action.uuid = "addc2d7cb578402f9ce1569402338c1b"
action.deleteMode = "Permissive"
action.sessionId = "429360288ef140afaeb86961b638ea62"
DeleteVipAction.Result res = action.call()
```

5.4.1.8.3 QueryVip

API Request

URLs

```
GET zstack/v1/vips
GET zstack/v1/vips/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth fbe1443215334b0aa609b5417f5f36ab" \
-X GET http://localhost:8080/zstack/v1/vips?
q=uuid=ba1cf7be9f20433fa5091bec091ba22d
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 39036aee2ef641afac5b253aee2377be" \
```

```
-X GET http://localhost:8080/zstack/v1/vips/
a077653982cb422daa06e6c2d840b140
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryVip`, and pressing the **Tab** key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "uuid": "8c5eb4938be549218fda4c87de4d8cad",
      "name": "new name",
      "ipRangeUuid": "7d0dda5b1c4f40069ec4cfd6b66bdf48",
      "l3NetworkUuid": "a81054a6807e47a09922473e9ab376cb",
      "ip": "192.168.0.1",
      "state": "Enabled",
      "gateway": "127.0.0.1",
      "netmask": "255.255.0.0",
      "peerL3NetworkUuid": [
        "64ef7a2ea9ec4095b343ea239a7ba344"
      ]
    }
  ]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventories	List	See inventories .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6

Name	Type	Description	Starting Version
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventories

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
name	String	The resource name.	0.6
description	String	The detailed description of the resource.	0.6
l3NetworkUuid	String	The L3 network UUID.	0.6
ip	String	The IP address of the IPv4 type.	0.6
state	String	The state of the VIP, including Enabled and Disabled.	0.6
gateway	String	The gateway.	0.6
netmask	String	The netmask.	0.6
prefixLen	String	The prefix length.	3.1.0
serviceProvider	String	The service provider that provides the VIP service.	0.6

Name	Type	Description	Starting Version
peerL3NetworkUuid	String	The L3 private network UUID or the VPC L3 network UUID.	0.6
useFor	String	The usage, such as port forwarding.	0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6

SDK Sample

Java SDK

```
QueryVipAction action = new QueryVipAction();
action.conditions = asList("uuid=0a573b1c687246ff970c04ef5d0eaf07");
action.sessionId = "bf2f206d12d742d3a9182ea663e12265";
QueryVipAction.Result res = action.call();
```

Python SDK

```
QueryVipAction action = QueryVipAction()
action.conditions = ["uuid=5a3bf1e979944ea4a958fdac5a8bcef2"]
action.sessionId = "bc563fd71d014e84a49f1d280ef020ff"
QueryVipAction.Result res = action.call()
```

5.4.1.8.4 CheckVipPortAvailability

API Request

URLs

```
GET zstack/v1/vips/{vipUuid}/check-port-availability
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json";charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET -d '{"params":
{"vipUuid":"b75e7bddf2803f6c85f8450b01262546","protocolType":"TCP","port":5}}'
http://localhost:8080/zstack/v1/vips/
e6ac71f8cf433c51822bedea67cf4781//check-port-availability
```

Parameters

Name	Type	Location	Description	Valid Values	Starting Version
vipUuid	String	body(contained in the params structure)	The VIP UUID .		4.7.21
protocolType	String	body(contained in the params structure)	The protocol type.		4.7.21
port	int	body(contained in the params structure)	The port to be queried.		4.7.21

API Response

Sample Response

```
{
  "available":true
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error	4.7.21
available	boolean		4.7.21

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	4.7.21
description	String	The brief description of the error.	4.7.21
details	String	The details about the error.	4.7.21

Name	Type	Description	Starting Version
elaboration	String	The reserved field. Default value: null.	4.7.21
opaque	LinkedHashMap	The reserved field. Default value: null.	4.7.21
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.7.21

SDK Sample

Java SDK

```
CheckVipPortAvailabilityAction action = new CheckVipPortAvailabilityAction();
action.vipUuid = "e6ac71f8cf433c51822bedea67cf4781";
action.protocolType = "TCP";
action.port = 5;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CheckVipPortAvailabilityAction.Result res = action.call();
```

Python SDK

```
CheckVipPortAvailabilityAction action = new CheckVipPortAvailabilityAction();
action.vipUuid = "e6ac71f8cf433c51822bedea67cf4781";
action.protocolType = "TCP";
action.port = 5;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CheckVipPortAvailabilityAction.Result res = action.call();
```

5.4.1.8.5 GetVipAvailablePort

API Request

URLs

```
GET zstack/v1/vips/{vipUuid}/get-port-availability
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json";charset=UTF-8" \
```

```
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \-X GET -d
'{"params":
{"vipUuid":"b75e7bddf2803f6c85f8450b01262546","protocolType":"TCP","start":5,"lim
http://localhost:8080/zstack/v1/vips/
e6ac71f8cf433c51822bedea67cf4781/get-port-availability
```

Parameters

Name	Type	Location	Description	Valid Values	Starting Version
vipUuid	String	body(contained in the params structure)	The VIP UUID .		4.7.21
protocolType	String	body(contained in the params structure)	The protocol type.		4.7.21
start	Integer	body(contained in the params structure)	The query start point.		4.7.21
limit	Integer	body(contained in the params structure)	The query limit .		4.7.21

API Response

Sample Response

```
{
  "availablePort": [1, 2, 3]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error	4.7.21
availablePort	List		4.7.21

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	4.7.21
description	String	The brief description of the error.	4.7.21
details	String	The details about the error.	4.7.21
elaboration	String	The reserved field. Default value: null.	4.7.21
opaque	LinkedHashMap	The reserved field. Default value: null.	4.7.21
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.7.21

SDK Sample

Java SDK

```
GetVipAvailablePortAction action = new GetVipAvailablePortAction();
action.vipUuid = "e6ac71f8cf433c51822bedea67cf4781";
action.protocolType = "TCP";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetVipAvailablePortAction.Result res = action.call();
```

Python SDK

```
GetVipAvailablePortAction action = new GetVipAvailablePortAction();
action.vipUuid = "e6ac71f8cf433c51822bedea67cf4781";
action.protocolType = "TCP";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
GetVipAvailablePortAction.Result res = action.call();
```

5.4.1.8.6 UpdateVip

API Request

URLs

```
PUT zstack/v1/vips/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateVip": {
    "name": "new name"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateVip":{"name":"new name"}}' \
http://localhost:8080/zstack/v1/vips/cb7f47adc9e0386d952990c88835048c/
actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
name	String	body (contained in the updateVip structure)	Optional. The resource name.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
description	String	body (contained in the updateVip structure)	Optional. The detailed description of the resource.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "afc62fc544524344804c558156b57938",
    "name": "new name",
    "ipRangeUuid": "cbe101ec40844785ac64f0693e56122a",
    "l3NetworkUuid": "06272fa02c0b4776a0fb1bab6171ba34",
    "ip": "192.168.0.1",
    "state": "Enabled",
    "gateway": "127.0.0.1",
    "netmask": "255.255.0.0",
    "peerL3NetworkUuid": [
      "e35c8f6a65d14e8492e6fb72382dc1b4"
    ]
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventory	VipInventory	See inventory .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code	0.6

Name	Type	Description	Starting Version
		that specifies an error . For example, SYS.1000, HOST.1001.	
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
name	String	The resource name.	0.6
description	String	The detailed description of the resource.	0.6
l3NetworkUuid	String	The L3 network UUID.	0.6
ip	String	The IP address of the IPv4 type.	0.6
state	String	The state of the VIP, including Enabled and Disabled.	0.6
gateway	String	The gateway.	0.6
netmask	String	The netmask.	0.6
prefixLen	String	The prefix length.	3.1.0

Name	Type	Description	Starting Version
serviceProvider	String	The service provider that provides the VIP service.	0.6
peerL3NetworkUuid	String	The L3 private network UUID or the VPC L3 network UUID.	0.6
useFor	String	The usage, such as port forwarding.	0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6

SDK Sample

Java SDK

```
UpdateVipAction action = new UpdateVipAction();
action.uuid = "dbea243ee5c04eb5b68f8905baec42c6";
action.name = "new name";
action.sessionId = "b9f7110e36c147e7abcfbd0215c56368";
UpdateVipAction.Result res = action.call();
```

Python SDK

```
UpdateVipAction action = UpdateVipAction()
action.uuid = "620313f8f6724571addc8ef00959d951"
action.name = "new name"
action.sessionId = "4632313cde0a4cbaa67c7ff2109ebe60"
UpdateVipAction.Result res = action.call()
```

5.4.1.8.7 ChangeVipState

API Request

URLs

```
PUT zstack/v1/vips/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeVipState": {
```

```

    "stateEvent": "enable"
  },
  "systemTags": [],
  "userTags": []
}

```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"changeVipState":{"stateEvent":"enable"}}' \
http://localhost:8080/zstack/v1/vips/5dae8db6e42831a1a219768d1f16abb5/
actions

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
stateEvent	String	body (contained in the changeVipState structure)	The state event.	- enable - disable	0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response**Sample Response**

```

{

Java SDK

```
GetVipUsedPortsAction action = new GetVipUsedPortsAction();
action.uuid = "771a6f6fae9d49dca26ae309d137549e";
action.protocol = "TCP";
action.sessionId = "ef2bbc8896fa4368a4da1c4b2e39a9d8";
GetVipUsedPortsAction.Result res = action.call();
```

Python SDK

```
GetVipUsedPortsAction action = GetVipUsedPortsAction()
action.uuid = "66313677af4e42fe8926703d89cf0164"
action.protocol = "TCP"
action.sessionId = "62f7ea6470954497966345142873bbfa"
GetVipUsedPortsAction.Result res = action.call()
```

5.4.1.8.9 SetVipQos

API Request

URLs

```
PUT zstack/v1/vips/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "setVipQos": {
    "port": 22.0,
    "outboundBandwidth": 1048576.0,
    "inboundBandwidth": 1048576.0
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"setVipQos":
{"port":22.0,"outboundBandwidth":1048576.0,"inboundBandwidth":1048576.0}}' \
http://localhost:8080/zstack/v1/vips/9b500046ab303d42a8d8a17565b5673b/
actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.3
port	Integer	body (contained in the setVipQos structure)	Optional. The port.		2.3
outboundBandwidth	Long	body (contained in the setVipQos structure)	Optional. The outbound bandwidth of the request port.		2.3
inboundBandwidth	Long	body (contained in the setVipQos structure)	Optional. The inbound bandwidth of the request port. Make sure that either inboundBandwidth or outboundBandwidth is not null.		2.3
systemTags	List	body	Optional. The system tags.		2.3

Name	Type	Location	Description	Optional Value	Starting Version
userTags	List	body	Optional. The user tags.		2.3

**Note:**

Make sure that either **inboundBandwidth** or **outboundBandwidth** is not null.

API Response

    "outboundBandwidth": 1048576.0
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.3
inventory	VipQosInventory	See inventory .	2.3

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	2.3
description	String	The brief description of the error.	2.3

Name	Type	Description	Starting Version
details	String	The details about the error.	2.3
elaboration	String	The reserved field. Default value: null.	2.3
opaque	LinkedHashMap	The reserved field. Default value: null.	2.3
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	2.3

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	2.3
vipUuid	String	The VIP UUID.	2.3
port	Integer	The port.	2.3
inboundBandwidth	Long	The outbound bandwidth of the response port.	2.3
outboundBandwidth	Long	The inbound bandwidth of the response port.	2.3
type	String	The QoS unit type.	2.3
createDate	Timestamp	The creation date.	2.3
lastOpDate	Timestamp	The last operation date.	2.3

SDK Sample

Java SDK

```
SetVipQosAction action = new SetVipQosAction();
action.uuid = "9b500046ab303d42a8d8a17565b5673b";
action.port = 22.0;
action.outboundBandwidth = 1048576.0;
action.inboundBandwidth = 1048576.0;
```

```
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
SetVipQosAction.Result res = action.call();
```

Python SDK

```
SetVipQosAction action = SetVipQosAction()
action.uuid = "9b500046ab303d42a8d8a17565b5673b"
action.port = 22.0
action.outboundBandwidth = 1048576.0
action.inboundBandwidth = 1048576.0
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
SetVipQosAction.Result res = action.call()
```

5.4.1.8.10 GetVipQos

API Request

URLs

```
GET zstack/v1/vip/{uuid}/vip-qos
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/vip/
e7bd5b22962e33ba8608533f18f10bd1/vip-qos
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	Optional. The resource UUID.		2.3
systemTags	List	query	Optional. The system tags.		2.3
userTags	List	query	Optional. The user tags.		2.3

lastOpDate	Timestamp	The last operation date.	2.3

SDK Sample

Java SDK

```
GetVipQosAction action = new GetVipQosAction();
action.uuid = "e7bd5b22962e33ba8608533f18f10bd1";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetVipQosAction.Result res = action.call();
```

Python SDK

```
GetVipQosAction action = GetVipQosAction()
action.uuid = "e7bd5b22962e33ba8608533f18f10bd1"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
GetVipQosAction.Result res = action.call()
```

5.4.1.8.11 DeleteVipQos

API Request

URLs

```
DELETE zstack/v1/vips/{uuid}/vip-qos?port={port}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/vips/
cbfc39af27633b31927fa0c259bfde80/vip-qos?
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.3
port	Integer	url	Optional. The port.		2.3
systemTags	List	body	Optional. The system tags.		2.3
userTags	List	body	Optional. The user tags.		2.3

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DeleteVipQosAction action = new DeleteVipQosAction();
action.uuid = "cbfc39af27633b31927fa0c259bfde80";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteVipQosAction.Result res = action.call();
```

Python SDK

```
DeleteVipQosAction action = DeleteVipQosAction()
action.uuid = "cbfc39af27633b31927fa0c259bfde80"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteVipQosAction.Result res = action.call()
```

5.4.1.9 EIP Operations

5.4.1.9.1 CreateEip

API Request

URLs

```
POST zstack/v1/eips
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "Test-EIP",
    "vipUuid": "7fdf1752627948afb2418f93825c478b",
    "vmNicUuid": "be5532b08b7a48949667b654468dc5a5"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
```

```
-H "Authorization: OAuth c0bd88f213cf42bc8b8fd42d1b269d50" \
-X POST -d '{"params":{"name":"Test-EIP","vipUuid":"f1b1901cefa939d7bf5775ec71735637","vmNicUuid":"bb64d3fc676b3b5cb0"}' \
http://localhost:8080/zstack/v1/eips
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The EIP name .		0.6
description	String	body (contained in the params structure)	Optional. The detailed description of the EIP.		0.6
vipUuid	String	body (contained in the params structure)	The VIP UUID .		0.6
vmNicUuid	String	body (contained in the params structure)	Optional. The VM NIC UUID.		0.6
usedIpUuid	String	body (contained in the params structure)	Optional. The IP UUID.		3.1.0
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID. If specified, the VM instance will use the specified value as the UUID.		0.6
systemTags	List	body	Optional. The EIP system tags.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
userTags	List	body	Optional. The EIP user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {
    "name": "Test-EIP",
    "vmNicUuid": "07f9715b85da40d9bd17e5f4277304bd",
    "vipUuid": "acc6dc9271f54e58ab94e4a1069bc7e5"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventory	EipInventory	See inventory .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6

Name	Type	Description	Starting Version
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
name	String	The resource name.	0.6
description	String	The detailed description of the resource.	0.6
vmNicUuid	String	The VM NIC UUID.	0.6
vipUuid	String	The VIP UUID.	0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6
state	String		0.6
viplp	String		0.6
guestlp	String		0.6

SDK Sample

Java SDK

```
CreateEipAction action = new CreateEipAction();
action.name = "Test-EIP";
action.vipUuid = "a600144228904c709d9d36a7d8e7bc50";

action.sessionId = "9bdd3970d72144c8899edb0158a4ed6d"
```

```
CreateEipAction.Result res = action.call()
```

5.4.1.9.2 DeleteEip

API Request

URLs

```
DELETE/v1/eips/{uuid}?deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 45ccb9eb4add405d9059fb45990a6e8c" \
-X DELETE http://localhost:8080/zstack/v1/
eips/468cb75384344acd87f22610d07080e5?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The EIP UUID		0.6
deleteMode	String	body	Optional. The delete mode.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DeleteEipAction action = new DeleteEipAction();
action.uuid = "7ff634c9d79c48ca976a34ce53951c76";
action.deleteMode = "Permissive";
action.sessionId = "44b7b711d77b4dfa91257db5b9a61585";
DeleteEipAction.Result res = action.call();
```

Python SDK

```
DeleteEipAction action = DeleteEipAction()
action.uuid = "e0699e3693ea429180371be5ca95e49e"
action.deleteMode = "Permissive"
action.sessionId = "ee71c70ee83a4ef8876f86d3876dbc8f"
DeleteEipAction.Result res = action.call()
```

5.4.1.9.3 QueryEip

API Request

URLs

```
GET zstack/v1/eips
GET zstack/v1/eips/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth ecbf8328397545a890cb7f299016ff65" \
-X GET http://localhost:8080/zstack/v1/eips
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \

```

5.4.1.9.8 AttachEip

API Request

URLs

```
POST zstack/v1/eips/{eipUuid}/vm-instances/nics/{vmNicUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```

{
  "params": {},
  "systemTags": [],
  "userTags": []
}

```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{}}' http://localhost:8080/zstack/
v1/eips/b7b3d87e803434f3b597638377830e68/vm-instances/
nics/3fb731573096397c90dbe65781d5b616

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
eipUuid	String	url	The EIP UUID		0.6
vmNicUuid	String	body	The VM NIC UUID.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
usedIpUuid	String	body (contained in the params structure)	Optional. The IP UUID.		3.1.0
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```

5.4.1.10.2 DeletePortForwardingRule

API Request

URLs

```
DELETE zstack/v1/port-forwarding/{uuid}?deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 064a2c25381042d6b623c12e26418e78" \
-X DELETE http://localhost:8080/zstack/v1/port-
forwarding/495b48a2bcf745e1ac584be6e366f0ab?deleteMode=Permissive

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
deleteMode	String	body	Optional. The delete mode. Options: Permissive Enforcing. Default mode: Permissive.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
			• Permissive: If an error occurs, or if the delete operation is refused, ZStack Cloud will stop the delete operation. In this mode, an error code that contains the failure reason will be returned. • Enforcing: ZStack Cloud will ignore all errors and permissions to delete directly the resource. In this mode, the delete operation will always succeed.		
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeletePortForwardingRuleAction action = new DeletePortForwardingRuleAction();
action.uuid = "42154ff320ea407dbc8b48088e541dcb";
action.deleteMode = "Permissive";
action.sessionId = "2b5cb5c82fb846669cd2c5e557bb140e";
DeletePortForwardingRuleAction.Result res = action.call();
```

Python SDK

```
DeletePortForwardingRuleAction action = DeletePortForwardingRuleAction()
action.uuid = "a8ac2d430d71487ea47419950e39ee4a"
action.deleteMode = "Permissive"
action.sessionId = "156eb3cd301546828a925386f331eb34"
DeletePortForwardingRuleAction.Result res = action.call()
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventories	List	See inventories .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventories

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
name	String	The resource name.	0.6
description	String	The detailed description of the resource.	0.6
vipIp	String	The IP address of the VIP.	0.6
guestIp	String	The IP address of the VM NIC.	0.6
vipUuid	String	The VIP UUID.	0.6
vipPortStart	Integer	The start port of the VIP.	0.6

Name	Type	Description	Starting Version
vipPortEnd	Integer	The end port of the VIP.	0.6
privatePortStart	Integer	The start port of the guest IP address.	0.6
privatePortEnd	Integer	The end port of the guest IP address.	0.6
vmNicUuid	String	The VM NIC UUID.	0.6
protocolType	String	The protocol type of the network traffic.	0.6
state	String	The state of the rule.	0.6
allowedCidr	String	The source CIDR. The port forwarding rule is only applied to the traffics of the source CIDR.	0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6

SDK Sample

Java SDK

```
QueryPortForwardingRuleAction action = new QueryPortForwardingRuleAction();
action.conditions = asList("name=pf1", "state=Enabled");
action.sessionId = "4311e616ca8b4bb19d0792be1e08f3b8";
QueryPortForwardingRuleAction.Result res = action.call();
```

Python SDK

```
QueryPortForwardingRuleAction action = QueryPortForwardingRuleAction()
action.conditions = ["name=pf1", "state=Enabled"]
action.sessionId = "b9745425f62d43289db77d9bfd117b35"
```

```
QueryPortForwardingRuleAction.Result res = action.call()
```

5.4.1.10.4 UpdatePortForwardingRule

API Request

URLs

```
PUT zstack/v1/port-forwarding/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updatePortForwardingRule": {
    "name": "pf2",
    "description": "new rule"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updatePortForwardingRule":
{"name":"pf2","description":"new rule"}}' \
http://localhost:8080/zstack/v1/port-
forwarding/07eb042c2f5837a99f4018c3ee7e4137/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
name	String	body (contained in the updatePort	Optional. The resource name.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
		Forwarding Rule structure)			
description	String	body (contained in the updatePort Forwarding Rule structure)	Optional. The detailed description of the resource.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```

Name	Type	Description	Starting Value
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventory	PortForwardingRuleInventory	See inventory .	0.6

#error

Name	Type	Description	Starting Value
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventory

Name	Type	Description	Starting Value
uuid	String	The resource UUID.	0.6
name	String	The resource name.	0.6
description	String	The detailed description of the resource.	0.6
vipIp	String	The IP address of the VIP.	0.6
guestIp	String	The IP address of the VM NIC.	0.6
vipUuid	String	The VIP UUID.	0.6
vipPortStart	Integer	The start port of the VIP.	0.6
vipPortEnd	Integer	The end port of the VIP.	0.6
privatePortStart	Integer	The start port of the guest IP address.	0.6
privatePortEnd	Integer	The end port of the guest IP address.	0.6
vmNicUuid	String	The VM NIC UUID.	0.6
protocolType	String	The protocol type of the network traffic.	0.6
state	String	The state of the rule.	0.6
allowedCidr	String	The source CIDR. The port forwarding rule is only applied to the traffics of the source CIDR.	0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6

SDK Sample

Java SDK

```
DetachPortForwardingRuleAction action = new DetachPortForwardingRuleAction();
action.uuid = "307d4bf5fed34a859ade0af30c6720f9";
```

```
action.sessionId = "8c78997bf11344d79b49a2254ab88bb8";
DetachPortForwardingRuleAction.Result res = action.call();
```

Python SDK

```
DetachPortForwardingRuleAction action = DetachPortForwardingRuleAction
()
action.uuid = "c284fc4425ea4467b81dad21df147a8e"
action.sessionId = "545a07392cb2409e9888f8737da4ddfc"
DetachPortForwardingRuleAction.Result res = action.call()
```

5.4.1.11 Load Balancing Operations

5.4.1.11.1 CreateLoadBalancer

API Request

URLs

```
POST zstack/v1/load-balancers
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "Test-Lb",
    "vipUuid": "59a98484f6fe43b9af1d782f725f40ac"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 855586410b7b4c0cba21bfd5ed2df4fb" \
-X POST -d '{"params":{"name":"Test-Lb","vipUuid":"d7720f0981853e91b37678e4acb1d4f0"}}' http://localhost:8080/zstack/v1/load-balancers
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The resource name.		0.6
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		0.6
vipUuid	String	body (contained in the params structure)	The VIP UUID.		0.6
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
CreateLoadBalancerAction action = new CreateLoadBalancerAction();
action.name = "Test-Lb";
action.vipUuid = "861b79a91e894ea68f77ffd7007bb57d";
action.sessionId = "056fdb04a78544fd9a43f757d6af4700";
```

```
CreateLoadBalancerAction.Result res = action.call();
```

Python SDK

```
CreateLoadBalancerAction action = CreateLoadBalancerAction()
action.name = "Test-Lb"
action.vipUuid = "3b1839e4bef9437a9b0cf28789951009"
action.sessionId = "b21c8f46991440d48be3dcf5c4a36f15"
CreateLoadBalancerAction.Result res = action.call()
```

5.4.1.11.2 AttachVipToLoadBalancer

API Request

URLs

```
POST zstack/v1/load-balancers/{loadBalancerUuid}/vip/{vipUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 855586410b7b4c0cba21bfd5ed2df4fb" \
-X POST -d '{"params":{}}' \
http://localhost:8080/zstack/v1/load-balancers/
a627a001122d397481460b388659a06b/vip/aa9d600755023b0084ec54593a54c1db
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
loadBalancerUuid	String	url	The load balancer uuid.		5.0.0

Name	Type	Location	Description	Optional Value	Starting Version
vipUuid	String	url	The VIP UUID		5.0.0
systemTags	List	body	Optional. The system tags.		5.0.0
userTags	List	body	Optional. The user tags.		5.0.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
AttachVipToLoadBalancerAction action = new AttachVipToLoadBalancerAction();
action.loadBalancerUuid = "a627a001122d397481460b388659a06b";
action.vipUuid = "aa9d600755023b0084ec54593a54c1db";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
AttachVipToLoadBalancerAction.Result res = action.call();
```

Python SDK

```
AttachVipToLoadBalancerAction action = AttachVipToLoadBalancerAction()
action.loadBalancerUuid = "a627a001122d397481460b388659a06b"
action.vipUuid = "aa9d600755023b0084ec54593a54c1db"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
AttachVipToLoadBalancerAction.Result res = action.call()
```

5.4.1.11.3 DeleteLoadBalancer

API Request

URLs

```
DELETE/v1/load-balancers/listeners/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 1ac325e9a263466d88a9bdf44c64ce96" \
-X DELETE http://localhost:8080/zstack/v1/load-balancers/listeners/
db191bc52926462eb21d24b30db7971f
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
deleteMode	String	body	Optional. The delete mode.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DeleteLoadBalancerListenerAction action = new DeleteLoadBalancerLi  
stenerAction();  
action.uuid = "2e7918e14cb345888cb57769f117fb91";  
action.sessionId = "efa96e940fce42c58c5e43885ce1f37f";  
DeleteLoadBalancerListenerAction.Result res = action.call();
```

Python SDK

```
DeleteLoadBalancerListenerAction action = DeleteLoadBalancerLi  
stenerAction()  
action.uuid = "be721492004a49038940201562070e1e"  
action.sessionId = "4a6baa8346204970bf3ce9397f48504a"  
DeleteLoadBalancerListenerAction.Result res = action.call()
```

5.4.1.11.4 QueryLoadBalancer

API Request

URLs

```
GET zstack/v1/load-balancers  
GET zstack/v1/load-balancers/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \  
-H "Authorization: OAuth 18a70c9589fa4d93a59a228488e459fb" \  
-X GET http://localhost:8080/zstack/v1/load-balancers
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \  
-H "Authorization: OAuth b3fd9ebb07e44e61be3c1f4d24710f9d" \  
-X GET http://localhost:8080/zstack/v1/load-  
balancers/2bc2a3e1855249c6ad436556915253d5
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryLoadBalancer`, and pressing the **Tab** key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "name": "Test-Lb",
      "uuid": "36c2ba1d4a86409693a2de40fa0473ca",
      "vipUuid": "8807c418b3b74ee5991006bcc4c670e4"
    }
  ]
}
```

SDK Sample

Java SDK

```
RefreshLoadBalancerAction action = new RefreshLoadBalancerAction();
action.uuid = "cad53be6896e43cf8aef4021d165f56d";
action.sessionId = "fec73392481a4edaa2738131516ef0d7";
RefreshLoadBalancerAction.Result res = action.call();
```

Python SDK

```
RefreshLoadBalancerAction action = RefreshLoadBalancerAction()
action.uuid = "3556da2f1d3b47e48ec3068a5c3055ba"
action.sessionId = "9947fe6582f44b5a961143d08f49a2eb"
RefreshLoadBalancerAction.Result res = action.call()
```

5.4.1.11.6 CreateLoadBalancerListener

API Request

URLs

```
POST zstack/v1/load-balancers/{loadBalancerUuid}/listeners
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "Test-Listener",
    "instancePort": 80,
    "loadBalancerPort": 80,
    "protocol": "http",
    "aclStatus": "disable",
    "aclType": "black"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"name":"Test-Listener","instancePort":80,"loadBalancerPort":80,"protocol":"http","aclStatus":"http://localhost:8080/zstack/v1/load-balancers/192b3fe960d63e078ced8f59529a25ad/listeners'}
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
loadBalancerUuid	String	url	The UUID of the load balancer listener.		0.6
name	String	body (contained in the params structure)	The name of the load balancer listener.		0.6
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		0.6
instancePort	Integer	body (contained in the params structure)	Optional. The VM port.		0.6
loadBalancerPort	int	body (contained in the params structure)	The load balancer port.		0.6
protocol	String	body (contained in the params structure)	Optional. The protocol.	- tcp - http - https - udp	3.0.0
certificateUuid	String	body (contained in the params structure)	Optional. The certificate UUID.		2.3.2

Name	Type	Location	Description	Optional Value	Starting Version
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		0.6
instancePort	Integer	body (contained in the params structure)	Optional.		3.9.0
healthCheckProtocol	String	body (contained in the params structure)	Optional. The health check protocol.	• tcp • udp • http	3.9.0
healthCheckMethod	String	body (contained in the params structure)	Optional. The health check method.	• GET • HEAD	3.9.0
healthCheckURI	String	body (contained in the params structure)	Optional. The health check URI.		3.9.0
healthCheckHttpCode	String	body (contained in the params structure)	Optional. The expected response code of the health check.		3.9.0
aclStatus	String	body (contained in the params structure)	The access control status.	• enable • disable	3.9.0
aclUuids	list	body (contained in the params structure)	Optional. The access control list.		3.9.0
aclType	String	body (contained in the params structure)	Optional. The access control type.	• white • black	3.9.0

Name	Type	Location	Description	Optional Value	Starting Version
tagUuids	list	body (contained in the params structure)	Optional. The tag UUID list.		3.9.0
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6
securityPolicyType	String	body (contained in the params structure)	Optional. The TLS security policy.	• tls_cipher_policy_default • tls_cipher_policy_1_0 • tls_cipher_policy_1_1 • tls_cipher_policy_1_2 • tls_cipher_policy_1_2_strict • tls_cipher_policy_1_2_strict_with_1_3	5.0.0
httpVersions	List	body (contained in the params structure)	Optional. The Load Balancer frontend network HTTP protocol version.	• h1 • h2	5.0.0
tcpProxyProtocol	String	body (contained in the params structure)	Optional. The TCP Proxy Protocol agreement.	• v1 • v2 • disable	5.0.0

Name	Type	Location	Description	Optional Value	Starting Version
httpCompressAlgos	List	body (contained in the params structure)	Optional. The HTTP compression algorithm.	- deflate - raw-deflate - gzip - disable	5.0.0

**Note:**

- When you create a load balancer listener in ZStack Cloud, you can set seven layers of health check parameters by adding the **healthCheckParameter** option to **SystemTags**.
 - Format of the **healthCheckParameter** option: `healthCheckParameter:: {parameter}`. Here, the parameter can be `healthCheckParameter::method:uri:expect-result`.
 - Example: `healthCheckParameter::GET:/healthstatus.html:http_2xx`
- When you create a load balancer listener in ZStack Cloud, you can set the access control status of the listener by adding the **accessControlStatus** option to **SystemTags**.
 - Format of the **accessControlStatus** option: `accessControlStatus:: {status}`
 - Example: `accessControlStatus::enable`
- When you create a load balancer listener in ZStack Cloud, you can set whether to enable the session persistence and specify the session persistence mode by adding the **sessionPersistence** option to **SystemTags**.
 - Format of the **sessionPersistence** option: `sessionPersistence:: { %s }`. The value of %s can be disable/iphash/insert/rewrite.
 - Example: `sessionPersistence::insert`.
- When you create a load balancer listener in ZStack Cloud, you can specify the session persistence time by adding the **sessionIdleTimeout** option to **SystemTags**.
 - Format of the **sessionIdleTimeout** option: `sessionIdleTimeout:: { %s }`. Here, %s is the session persistence time. Valid value: 30-3600. Unit:second.
 - Example: `sessionIdleTimeout::60`
- When you create a load balancer listener in ZStack Cloud, you can set the rewritten cookie name by adding the **cookieName** option to **SystemTags**.

- Format of the `validRegexValues::{%s}`. Here, %s is the cookie name. The name must be 1 to 20 characters and can contain uppercase or lowercase letters, digits, hyphens (-), and underscores (_).
- Example: `cookieName::zstack-cookie`.
- When you create a load balancer listener in ZStack Cloud, you can set whether to enable http redirect by adding the **httpRedirectHttps** option to **SystemTags**.
 - Format of the `httpRedirectHttps::{%s}`. Here, the value of %s can be disable/enable.
 - Example: `httpRedirectHttps::enable`
- When you create a load balancer listener in ZStack Cloud, you can set redirect port by adding **redirectPort** option to **SystemTags**.
 - Format of the `redirectPort::{%s}`. Here, the number range of %s can be 1-65535.
 - Example: `redirectPort::80`
- When you create a load balancer listener in ZStack Cloud, you can set redirect status code by adding **statusCode** optional to **SystemTags**.
 - Format of the `statusCode::{%s}`. Here, the value of %s can be 301/302/303/307/308.
 - Example: `statusCode::302`

SDK Sample

Java SDK

```

CreateLoadBalancerListenerAction action = new CreateLoadBalancerLi
stenerAction();
action.loadBalancerUuid = "192b3fe960d63e078ced8f59529a25ad";
action.name = "Test-Listener";
action.instancePort = 80;
action.loadBalancerPort = 80;
action.protocol = "http";
action.aclStatus = "disable";
action.aclType = "black";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";

```

```
CreateLoadBalancerListenerAction.Result res = action.call();
```

Python SDK

```
CreateLoadBalancerListenerAction action = CreateLoadBalancerLi  
stenerAction()  
action.loadBalancerUuid = "192b3fe960d63e078ced8f59529a25ad"  
action.name = "Test-Listener"  
action.instancePort = 80  
action.loadBalancerPort = 80  
action.protocol = "http"  
action.aclStatus = "disable"  
action.aclType = "black"  
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"  
CreateLoadBalancerListenerAction.Result res = action.call()
```

5.4.1.11.7 DeleteLoadBalancerListener

API Request

URLs

```
DELETE/v1/load-balancers/listeners/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \  
-H "Authorization: OAuth 1ac325e9a263466d88a9bdf44c64ce96" \  
-X DELETE http://localhost:8080/zstack/v1/load-balancers/listeners/  
db191bc52926462eb21d24b30db7971f?
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteLoadBalancerListenerAction action = new DeleteLoadBalancerLi
stenerAction();
action.uuid = "2e7918e14cb345888cb57769f117fb91";
action.sessionId = "efa96e940fce42c58c5e43885ce1f37f";
DeleteLoadBalancerListenerAction.Result res = action.call();
```

Python SDK

```
DeleteLoadBalancerListenerAction action = DeleteLoadBalancerLi
stenerAction()
action.uuid = "be721492004a49038940201562070e1e"
action.sessionId = "4a6baa8346204970bf3ce9397f48504a"
DeleteLoadBalancerListenerAction.Result res = action.call()
```

5.4.1.11.8 QueryLoadBalancerListener

API Request

URLs

```
GET zstack/v1/load-balancers/listeners
GET zstack/v1/load-balancers/listeners/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 6d7ca1c2f39440d5a4110962854c3234" \
-X GET http://localhost:8080/zstack/v1/load-balancers/listeners
```

```
curl \
-H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 057112ec0d5e4bcd9193b1f9499169eb" \
```

```
-X GET http://localhost:8080/zstack/v1/load-balancers/listeners/cdf776df1cb04ae6a3cf1fb1330dab2d
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryLoadBalancerListener**, and pressing the **Tab** key.

```
QueryLoadBalancerListenerAction action = QueryLoadBalancerListenerAction()  
action.conditions = []  
action.sessionId = "529b237f77cd4130b861ebe99a30c983"
```

```
QueryLoadBalancerListenerAction.Result res = action.call()
```

5.4.1.11.9 UpdateLoadBalancerListener

API Request

URLs

```
PUT zstack/v1/load-balancers/listeners/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateLoadBalancerListener": {
    "name": "Test-Listener",
    "description": "desc info"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateLoadBalancerListener":{"name":"Test-Listener","description":"desc info"}}' \

"sessionPersistence":"insert","sessionIdleTimeout":60}}'
http://localhost:8080/zstack/v1/load-balancers/listeners/
ca4f7cea0c5a3a329742b127d7f80615/actions

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.4.0
connectionIdleTimeout	Integer	body (contained in the changeLoadBalancerListener structure)	Optional. The connection timeout.		4.6.0
maxConnection	Integer	body (contained in the changeLoadBalancerListener structure)	Optional. The maximum number of concurrent connections.		4.6.0
balancerAlgorithm	String	body (contained in the changeLoadBalancerListener structure)	Optional. The load balancing algorithm.	• weightroundrobin • roundrobin • leastconn • source	4.6.0
healthCheckTarget	String	body (contained in the changeLoadBalancerListener structure)	Optional. The health check port.		4.6.0
healthyThreshold	Integer	body (contained in the changeLoadBalancerListener structure)	Optional. The threshold of the healthy state.		4.6.0

Name	Type	Location	Description	Optional Value	Starting Version
unhealthyThreshold	Integer	body (contained in the changeLoadBalancerListener structure)	Optional. The threshold of the unhealthy state.		4.6.0
healthCheckInterval	Integer	body (contained in the changeLoadBalancerListener structure)	Optional. The health check interval.		4.6.0
healthCheckProtocol	String	body (contained in the changeLoadBalancerListener structure)	Optional. The health check protocol.	• tcp • udp • http	3.9.0
healthCheckMethod	String	body (contained in the changeLoadBalancerListener structure)	Optional. The health check method.	• GET • HEAD	3.9.0
healthCheckURI	String	body (contained in the changeLoadBalancerListener structure)	Optional. The health check URI.		3.9.0
healthCheckHttpCode	String	body (contained in the	Optional. The expected response code		3.9.0

Name	Type	Location	Description	Optional Value	Starting Version
		changeLoadBalancerListener structure)	of the health check.		
aclStatus	String	body (contained in the changeLoadBalancerListener structure)	The access control status.	• enable • disable	3.9.0
securityPolicyType	String	body (contained in the changeLoadBalancerListener structure)	The transport layer security policy.	• tls_cipher_policy_default • tls_cipher_policy_1_0 • tls_cipher_policy_1_1 • tls_cipher_policy_1_2 • tls_cipher_policy_1_2_strict • tls_cipher_policy_1_2_strict_with_1_3	4.1.0
nbprocess	Integer	body (contained in the changeLoadBalancerListener structure)	The number of SLB processes.		4.1.0

Name	Type	Location	Description	Optional Value	Starting Version
httpMode	String	body (contained in the changeLoad BalancerListener structure)	The HTTP mode of SLB.	• http-keep-alive • http-server-close • http-tunnel • httpclose • forceclose	4.1.0
sessionPersistence	String	body (contained in the changeLoad BalancerListener structure)	The session persistence mode.	• disable • iphash • insert • rewrite	4.6.0
sessionIdleTimeout	Integer	body (contained in the changeLoad BalancerListener structure)	The session persistence time.		4.6.0
cookieName	String	body (contained in the changeLoad BalancerListener structure)	The Cookie name.		4.6.0
systemTags	List	body	Optional. The system tags.		3.4.0
userTags	List	body	Optional. The user tags.		3.4.0
httpRedirectHttps	String	body (contained in the changeLoad BalancerListener structure)	Optional. The http redirects https.	• disable • enable	4.7.21

Name	Type	Location	Description	Optional Value	Starting Version
		stener structure)			
redirectPort	Integer	body (contained in the changeLoad BalancerLi stener structure)	Optional. The redirect port.		4.7.21
statusCode	Integer	body (contained in the changeLoad BalancerLi stener structure)	Optional. The redirect status code.	• 301 • 302 • 303 • 307 • 308	4.7.21
httpVersions	List	body (contained in the changeLoad BalancerLi stener structure)	Optional. The Load Balancer frontend network HTTP protocol version.	• h1 • h2	5.0.0
tcpProxyProtocol	String	body (contained in the changeLoad BalancerLi stener structure)	Optional. The TCP Proxy Protocol agreement.	• v1 • v2 • disable	5.0.0
httpCompressAlgos	List	body (contained in the changeLoad BalancerLi stener structure)	Optional. The HTTP compression algorithm.	• deflate • raw-deflate • gzip • diasble	5.0.0

**Note:**

- When you change a parameter of a load balancer listener in ZStack Cloud, you can set the weight of the backend server by adding the **balancerWeight** option to **SystemTags**.
 - Format of the **balancerWeight** option: `balancerWeight:::{nicUuid}:::{weight}` . Here, weight is the weight of the backend server. Weight range: 0-100, integer. Default value: 100.
 - Example: `balancerWeight::{"c44007641c9040c6b2587e19b1b3e2b0"}::{100}`

```

5.4.1.11.11 GetCandidateVmNicsForLoadBalancer

API Request

URLs

```
GET zstack/v1/load-balancers/listeners/{listenerUuid}/vm-instances/
candidate-nics
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth e75a29e482104fd094dde90d69b212c6" \
-X GET http://localhost:8080/zstack/v1/load-balancers/
listeners/4fe68eaa71ec47699c19b7819bd52f80/vm-instances/candidate-nics
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
listenerUuid	String	url	The UUID of the load balancer listener.		0.6
systemTags	List	query	Optional. The system tags.		0.6
userTags	List	query	Optional. The user tags.		0.6

API Response

Sample Response

```

}
]
}

```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventories	List	See inventories .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventories

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
vmInstanceUuid	String	The VM instance UUID.	0.6
l3NetworkUuid	String	The L3 network UUID.	0.6
ip	String		0.6
mac	String		0.6
netmask	String		0.6
gateway	String		0.6
metaData	String		0.6
deviceId	Integer		0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6

SDK Sample

Java SDK

```
GetCandidateVmNicsForLoadBalancerAction action = new GetCandidateVmNicsForLoadBalancerAction();
action.listenerUuid = "939a6fd54937468b9b9c27c4d3903c6e";
action.sessionId = "af93732431cf45e7828b579fcb9e46bc";
GetCandidateVmNicsForLoadBalancerAction.Result res = action.call();
```

Python SDK

```
GetCandidateVmNicsForLoadBalancerAction action = GetCandidateVmNicsForLoadBalancerAction()
action.listenerUuid = "a100b63272ff460eb0301f5759ff2fce"
action.sessionId = "423e456aac8041aa9bfdf4ce26ab32ce"
```

```
GetCandidateVmNicsForLoadBalancerAction.Result res = action.call()
```

5.4.1.11.12 AddVmNicToLoadBalancer

API Request

URLs

```
POST zstack/v1/load-balancers/listeners/{listenerUuid}/vm-instances/nics
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "vmNicUuids": [
      "aadbfd8413545d9a1d53d8a0cfa58a8"
    ]
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 47ac995879a9490f83b6b6ef79bca99f" \
-X POST -d '{"params":{"vmNicUuids":
["f141d926d13b34cc905507ce7aa9a479"]}}' \
http://localhost:8080/zstack/v1/load-balancers/
listeners/21e488793c5831a0842d72a63bcdaf04/vm-instances/nics
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vmNicUuids	List	body (contained in the params structure)	The VM NIC UUIDs.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
listenerUuid	String	url	The UUID of the load balancer listener.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

**Note:**

- When you add a VM NIC to a load balancer in ZStack Cloud, you can set the weight of the backend server by adding the **balancerWeight** option to **SystemTags**.
 - Format of the **balancerWeight** option: `balancerWeight::{"nicUuid"}::{"weight"}`. Here, weight is the weight of the backend server. Weight range: 0-100, integer. Default value: 100.
 - Example: `balancerWeight::{"c44007641c9040c6b2587e19b1b3e2b0"}::{"100"}`

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
AddVmNicToLoadBalancerAction action = new AddVmNicToLoadBalancerAction
();
action.vmNicUuids = asList("01741d3cc9d0422197b2176f3c977d52");
action.listenerUuid = "fd774b08700545ddaa5938fb2ccf4320";
action.sessionId = "ed5ea413b2354a94ac7b427528f88d26";
```

```
AddVmNicToLoadBalancerAction.Result res = action.call()
```

Python SDK

```
AddVmNicToLoadBalancerAction action = AddVmNicToLoadBalancerAction()
action.vmNicUuids = [9b08b7603be945d2928a08a0e8d1fc00]
action.listenerUuid = "874bcad239a645af8cd69ed267a48809"
action.sessionId = "a70b5f9862424ceb8ea8e2c7d679e0df"
AddVmNicToLoadBalancerAction.Result res = action.call()
```

5.4.1.11.13 RemoveVmNicFromLoadBalancer

API Request

URLs

```
DELETE/v1/load-balancers/listeners/{listenerUuid}/vm-instances/nics?
vmNicUuids={vmNicUuids}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth a846184b54d845dbb85e50ba35364b6e" \
-X DELETE http://localhost:8080/zstack/v1/load-balancers/

SDK Sample

Java SDK

```
RemoveVmNicFromLoadBalancerAction action = new RemoveVmNicFromLoadBalancerAction();
action.vmNicUuids = asList("6d6c33021c0a432c9030046c3a24be6e");
action.listenerUuid = "0a11bad9fdb84538953689a5c4430126";
action.sessionId = "867ccf6fbe934fe19e8bb5ba861de7fd";
RemoveVmNicFromLoadBalancerAction.Result res = action.call();
```

Python SDK

```
RemoveVmNicFromLoadBalancerAction action = RemoveVmNicFromLoadBalancerAction()
action.vmNicUuids = [ef9de345e68f4e6aa51164eff6ee5249]
action.listenerUuid = "04f42584e0a14afdb382e0961f057076"
action.sessionId = "46c7dabf668943faa1bb8b6be0d60397"
RemoveVmNicFromLoadBalancerAction.Result res = action.call()
```

5.4.1.11.14 UpdateLoadBalancer

API Request

URLs

```
PUT zstack/v1/load-balancers/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateLoadBalancer": {
    "name": "Test-Lb",
    "description": "info"
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateLoadBalancer":{"name":"Test-Lb","description":"info"}}' \
http://localhost:8080/zstack/v1/load-balancers/
a355359f46d13e5ab64d6eeff66aedbf/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
name	String	body (contained in the updateLoadBalancer structure)	Optional. The resource name.		0.6
description	String	body (contained in the updateLoadBalancer structure)	Optional. The detailed description of the resource.		0.6
resourceUuid	String	body (contained in the updateLoadBalancer structure)	Optional.		0.6
systemTags	List	body	Optional. The system tags.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
UpdateLoadBalancerAction action = new UpdateLoadBalancerAction();
action.uuid = "a355359f46d13e5ab64d6eeff66aedbf";
action.name = "Test-Lb";
action.description = "info";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateLoadBalancerAction.Result res = action.call();
```

Python SDK

```
UpdateLoadBalancerAction action = UpdateLoadBalancerAction()
action.uuid = "a355359f46d13e5ab64d6eeff66aedbf"
action.name = "Test-Lb"
action.description = "info"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
UpdateLoadBalancerAction.Result res = action.call()
```

5.4.1.11.15 GetLoadBalancerOwner

API Request

URLs

```
GET zstack/v1/load-balancers/{loadBalancerUuid}/owner
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/load-balancers/01a14d335cec36a7b0c36bedc8181465/owner?
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
loadBalancerUuid	String	url	The load balancer UUID.		5.1.0
systemTags	List	query	Optional. The system tags.		5.1.0
userTags	List	query	Optional. The user tags.		5.1.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	5.1.0
description	String	The brief description of the error.	5.1.0

Name	Type	Description	Starting Version
details	String	The details about the error.	5.1.0
elaboration	String	The reserved field. Default value: null.	5.1.0
opaque	LinkedHashMap	The reserved field. Default value: null.	5.1.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	5.1.0

SDK Sample

Java SDK

```
QuerySlbVmInstanceAction action = new QuerySlbVmInstanceAction();
action.conditions = asList("uuid=f6fba7cb05293adc9afb013d01b7ad5b");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QuerySlbVmInstanceAction.Result res = action.call();
```

Python SDK

```
QuerySlbVmInstanceAction action = QuerySlbVmInstanceAction()
action.conditions = ["uuid=2c88152e016f37838064f644e2225968"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QuerySlbVmInstanceAction.Result res = action.call()
```

```

5.4.1.11.21 DeleteCertificate

API Request

URLs

```
DELETE zstack/v1/certificates/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/
certificates/378bccfaa21d3b7fbb7b9bb014d1541c
```

Request Parameters

Name	Description	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.3.2
deleteMode	String	body	Optional. The delete mode.		2.3.2
systemTags	List	body	Optional. The system tags.		2.3.2
userTags	List	body	Optional. The user tags.		2.3.2

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteCertificateAction action = new DeleteCertificateAction();
action.uuid = "378bccfaa21d3b7fbb7b9bb014d1541c";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteCertificateAction.Result res = action.call();
```

Python SDK

```
DeleteCertificateAction action = DeleteCertificateAction()
action.uuid = "378bccfaa21d3b7fbb7b9bb014d1541c"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
DeleteCertificateAction.Result res = action.call()
```

5.4.1.11.22 QueryCertificate

API Request

URLs

```
GET zstack/v1/certificates
GET zstack/v1/certificates/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/certificates
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/
certificates/658b7eeb6e2e3ea28c4243ae24e20e07
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryCertificate`, and pressing the **Tab** key.

API Response

Sample Response

```

url	String		4.1.0
ipEntries	String		4.1.0
description	String	The detailed description of the resource.	4.1.0
createDate	Timestamp	The creation date.	4.1.0

Name	Type	Description	Starting Version
lastOpDate	Timestamp	The last operation date.	4.1.0

SDK Sample

Java SDK

```
ChangeAccessControlListRedirectRuleAction action = new ChangeAccessControlListRedirectRuleAction();
action.uuid = "e58d9a2195c432fda747f33a884028ed";
action.name = "acl-group";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
ChangeAccessControlListRedirectRuleAction.Result res = action.call();
```

Python SDK

```
ChangeAccessControlListRedirectRuleAction action = ChangeAccessControlListRedirectRuleAction()
action.uuid = "e58d9a2195c432fda747f33a884028ed"
action.name = "acl-group"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
ChangeAccessControlListRedirectRuleAction.Result res = action.call()
```

5.4.1.11.28 ChangeAccessControlListServerGroup

API Request

URLs

```
POST zstack/v1/load-balancers/listener/acl/{aclUuid}/servergroup/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeAccessControlListServerGroup": {
    "serverGroupUuids": [
      "89bdb613cad93f5f881b9127986d4d1b"
    ],
    "listenerUuid": "e58cd2cd6a633f999909c7e5ce448e07"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"changeAccessControlListServerGroup":{"serverGroupUuids":
["89bdb613cad93f5f881b9127986d4d1b"],"listenerUuid":"e58cd2cd6a633f999909c7e5ce4
http://localhost:8080/zstack/v1/load-balancers/listener/
acl/07f904e5fbc8312992dd85a99c8edc9b/servergroup/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
serverGroupUuids	List	body (contained in the changeAccessControlListServerGroup structure)	The UUID of the load balancer server group.		4.1.0
listenerUuid	String	body (contained in the changeAccessControlListServerGroup structure)	The UUID of the listener.		4.1.0
aclUuid	String	url	The UUID of the access control list.		4.1.0
systemTags	List	body	Optional. The system tags.		4.1.0
userTags	List	body	Optional. The user tags.		4.1.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
ChangeAccessControlListServerGroupAction action = new ChangeAccessControlListServerGroupAction();
action.serverGroupUuids = asList("89bdb613cad93f5f881b9127986d4d1b");
action.listenerUuid = "e58cd2cd6a633f999909c7e5ce448e07";
action.aclUuid = "07f904e5fbc8312992dd85a99c8edc9b";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
ChangeAccessControlListServerGroupAction.Result res = action.call();
```

Python SDK

```
ChangeAccessControlListServerGroupAction action = ChangeAccessControlListServerGroupAction()
action.serverGroupUuids = [89bdb613cad93f5f881b9127986d4d1b]
action.listenerUuid = "e58cd2cd6a633f999909c7e5ce448e07"
action.aclUuid = "07f904e5fbc8312992dd85a99c8edc9b"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
ChangeAccessControlListServerGroupAction.Result res = action.call()
```

5.4.1.11.29 GetLoadBalancerListenerACLEntries

API Request

URLs

```
POST zstack/v1/load-balancers/listeners/access-control-lists/entries
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X GET http://localhost:8080/zstack/v1/load-balancers/listeners/
access-control-lists/entries
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
listenerUids	List	query	Optional. The listener UUID.		4.1.0
type	String	query	Optional. The type.		4.1.0
systemTags	List	query	Optional. The system tags.		4.1.0
userTags	List	query	Optional. The user tags.		4.1.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
GetLoadBalancerListenerACLEntriesAction action = new GetLoadBalancerListenerACLEntriesAction();
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetLoadBalancerListenerACLEntriesAction.Result res = action.call();
```

Python SDK

```
GetLoadBalancerListenerACLEntriesAction action = GetLoadBalancerListenerACLEntriesAction()
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
GetLoadBalancerListenerACLEntriesAction.Result res = action.call()
```

5.4.1.11.30 CreateAccessControlList

API Request

URLs

```
POST zstack/v1/access-control-lists
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "acl-group",
    "ipVersion": 4.0
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"name":"acl-group","ipVersion":4.0}}' http://
localhost:8080/zstack/v1/access-control-lists
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The resource name.		3.9.0
description	String	body (contained in	Optional. The detailed		3.9.0

Name	Type	Location	Description	Optional Value	Starting Version
		the params structure)	description of the resource.		
ipVersion	Integer	body (contained in the params structure)	Optional. The IP version.	• 4 • 6	3.9.0
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		3.9.0
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID list.		3.9.0
systemTags	List	body	Optional. The system tags.		3.9.0
userTags	List	body	Optional. The user tags.		3.9.0

API Response

Sample Response

```
{
  "inventory": {
    "name": "acl-group",
    "ipVersion": 4.0
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.9.0
inventory	AccessControlListInventory	See inventory .	3.9.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.9.0
description	String	The brief description of the error.	3.9.0
details	String	The details about the error.	3.9.0
elaboration	String	The reserved field. Default value: null.	3.9.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.9.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.9.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.9.0
name	String	The resource name.	3.9.0
ipVersion	Integer	The IP version.	3.9.0
description	String	The detailed description of the resource.	3.9.0
createDate	Timestamp	The creation date.	3.9.0
lastOpDate	Timestamp	The last operation date.	3.9.0
entries	List	See entries .	3.9.0

#entries

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.9.0
aclUuid	String	The UUID of the access control list.	3.9.0
ipEntries	String	The IP entries.	3.9.0
description	String	The detailed description of the resource.	3.9.0
createDate	Timestamp	The creation date.	3.9.0
lastOpDate	Timestamp	The last operation date.	3.9.0

SDK Sample

Java SDK

```
CreateAccessControlListAction action = new CreateAccessControlListAction();
action.name = "acl-group";
action.ipVersion = 4.0;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateAccessControlListAction.Result res = action.call();
```

Python SDK

```
CreateAccessControlListAction action = CreateAccessControlListAction()
action.name = "acl-group"
action.ipVersion = 4.0
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CreateAccessControlListAction.Result res = action.call()
```

5.4.1.11.31 DeleteAccessControlList

API Request

URLs

```
DELETE zstack/v1/access-control-lists/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X DELETE http://localhost:8080/zstack/v1/access-control-lists/
f2a128d702d83f4389ad82d425b0e74e
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.9.0
deleteMode	String	body	Optional. The delete mode . Options: Permissive Enforcing. Default mode: Permissive.		3.9.0
systemTags	List	body	Optional. The system tags.		3.9.0
userTags	List	body	Optional. The user tags.		3.9.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteAccessControlListAction action = new DeleteAccessControlListAction();
action.uuid = "f2a128d702d83f4389ad82d425b0e74e";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteAccessControlListAction.Result res = action.call();
```

Python SDK

```
DeleteAccessControlListAction action = DeleteAccessControlListAction()
```

```

action.uuid = "f2a128d702d83f4389ad82d425b0e74e"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteAccessControlListAction.Result res = action.call()

```

5.4.1.11.32 QueryAccessControlList

API Request

URLs

```
GET zstack/v1/access-control-lists
```

```
GET zstack/v1/access-control-lists/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/access-control-lists

```

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/access-control-lists/83146a1d0dd93c6abc53788a6434bd57

```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using zstack-cli, entering **QueryAccessControlList**, and pressing the **Tab** key.

API Response

Sample Response

```

{
  "inventories": [
    {
      "uuid": "0abdbd20b8173ccf89f881309b5e40d0",
      "name": "acl-group"
    }
  ]
}

```

5.4.1.11.36 RemoveAccessControlListFromLoadBalancer

API Request

URLs

```
DELETE zstack/v1/load-balancers/listeners/{listenerUuid}/access-control-lists
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/load-balancers/
listeners/0299b3e26af5350c8db91930723d2065/access-control-lists

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
aclUuids	List	body	The UUID of the access control list.		3.9.0
listenerUuid	String	url	The listener UUID.		3.9.0
serverGroupUuids	List	body	Optional. The UUID of the load balancer server group.		4.1.0
systemTags	List	body	Optional. The system tags.		3.9.0
userTags	List	body	Optional. The user tags.		3.9.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "fb39937eaf5b3564af4b23d48802d438",
    "name": "test-lb-listener"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.9.0
inventory	LoadBalancerListenerInventory	See inventory .	3.9.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.9.0
description	String	The brief description of the error.	3.9.0
details	String	The details about the error.	3.9.0
elaboration	String	The reserved field. Default value: null.	3.9.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.9.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error	3.9.0

SDK Sample

Java SDK

```
GetCandidateL3NetworksForLoadBalancerAction action = new GetCandidateL3NetworksForLoadBalancerAction();
action.listenerUuid = "6ecc19bdec0139499e3abf6c51bca683";
action.limit = 1000.0;
action.start = 0.0;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetCandidateL3NetworksForLoadBalancerAction.Result res = action.call();
```

Python SDK

```
GetCandidateL3NetworksForLoadBalancerAction action = GetCandidateL3NetworksForLoadBalancerAction()
action.listenerUuid = "6ecc19bdec0139499e3abf6c51bca683"
action.limit = 1000.0
action.start = 0.0
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetCandidateL3NetworksForLoadBalancerAction.Result res = action.call()
```

5.4.1.11.38 CreateLoadBalancerServerGroup

API Request

URLs

```
POST zstack/v1/load-balancers/{loadBalancerUuid}/servergroups
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "create-Lb",
    "ipVersion": 4
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8"
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c"
-X POST -d '{"params":{"name":"create-Lb","ipVersion":4}}' http://
localhost:8080/zstack/v1/load-
balancers/7cac70b63aad32dda436e95bba3c34cb/servergroups
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
name	String	body(contained in the params structure)	The name of the server group for load balancing.		4.0.0
description	String	body(contained in the params structure)	Optional. The detailed description of the server group.		4.0.0
loadBalancerUuid	String	url	The load balancer UUID.		4.0.0
resourceUuid	String	body(contained in the params structure)	Optional. The UUID of the server group.		4.0.0
tagUuids	List	body(contained in the params structure)	Optional. The tag UUIDs.		4.0.0
systemTags	List	body	Optional. The system tags.		4.0.0
userTags	List	body	Optional. The user tags.		4.0.0

Name	Type	Location	Description	Valid Value	Starting Version
ipVersion	Integer	body(contained in the params structure)	Optional. The ip version.		5.1.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
CreateLoadBalancerServerGroupAction action = new CreateLoadBalancerServerGroupAction();
action.name = "create-Lb";
action.loadBalancerUuid = "7cac70b63aad32dda436e95bba3c34cb";
action.ipVersion = 4;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateLoadBalancerServerGroupAction.Result res = action.call();
```

Python SDK

```
CreateLoadBalancerServerGroupAction action = CreateLoadBalancerServerGroupAction()
action.name = "create-Lb"
action.loadBalancerUuid = "7cac70b63aad32dda436e95bba3c34cb"
action.ipVersion = 4
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
CreateLoadBalancerServerGroupAction.Result res = action.call()
```

5.4.1.11.39 DeleteLoadBalancerServerGroup

API Request

URLs

```
DELETE zstack/v1/load-balancers/servergroups/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/load-balancers/
servergroups/1e1fef3a79563c1080210f094ea62898?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
uuid	String	url	The UUID of the server group.		4.0.0
systemTags	List	body	Optional. The system tags.		4.0.0
userTags	List	body	Optional. The user tags.		4.0.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DeleteLoadBalancerServerGroupAction action = new DeleteLoadBalancerSe  
rverGroupAction();  
action.uuid = "1e1fef3a79563c1080210f094ea62898";  
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";  
DeleteLoadBalancerServerGroupAction.Result res = action.call();
```

Python SDK

```
DeleteLoadBalancerServerGroupAction action = DeleteLoadBalancerSe  
rverGroupAction()  
action.uuid = "1e1fef3a79563c1080210f094ea62898"  
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"  
DeleteLoadBalancerServerGroupAction.Result res = action.call()
```

5.4.1.11.40 UpdateLoadBalancerServerGroup

API Request

URLs

```
PUT zstack/v1/load-balancers/servergroups/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{  
  "updateLoadBalancerServerGroup": {  
    "name": "updateServerGroup",  
    "description": "updateServerGroup"  
  },  
  "systemTags": [],  
  "userTags": []  
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \  
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \  

```

```
-X PUT -d '{"updateLoadBalancerServerGroup":
{"name":"updateServerGroup","description":"updateServerGroup"}}'
http://localhost:8080/zstack/v1/load-balancers/servergroups/
e29a3b43310933718221e4c314c8af6f/actions
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
uuid	String	url	The resource UUID.		4.0.0
name	String	body(contained in the updateLoadBalancerServerGroup structure)	Optional. The resource name.		4.0.0
description	String	body(contained in the updateLoadBalancerServerGroup structure)	Optional. The detailed description of the resource.		4.0.0
systemTags	List	body	Optional. The system tags.		4.0.0
userTags	List	body	Optional. The user tags.		4.0.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
UpdateLoadBalancerServerGroupAction action = new UpdateLoadBalancerServerGroupAction();
action.uuid = "e29a3b43310933718221e4c314c8af6f";
action.name = "updateServerGroup";
action.description = "updateServerGroup";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateLoadBalancerServerGroupAction.Result res = action.call();
```

Python SDK

```
UpdateLoadBalancerServerGroupAction action = UpdateLoadBalancerServerGroupAction()
action.uuid = "e29a3b43310933718221e4c314c8af6f"
action.name = "updateServerGroup"
action.description = "updateServerGroup"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateLoadBalancerServerGroupAction.Result res = action.call()
```

5.4.1.11.41 QueryLoadBalancerServerGroup

API Request

URLs

```
GET zstack/v1/load-balancers/servergroups
```

```
GET zstack/v1/load-balancers/servergroups/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/load-balancers/servergroups
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \

```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
serverGroupUuid	String	url	The UUID of the server group for load balancing.		4.0.0
vmNics	List	body(contained in the params structure)	Optional. The NIC of the backend server.		4.0.0
servers	List	body(contained in the params structure)	Optional. The IP address of the backend server.		4.0.0
systemTags	List	body	Optional. The system tags.		4.0.0
userTags	List	body	Optional. The user tags.		4.0.0

API Response

Sample Response

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
AddBackendServerToServerGroupAction action = new AddBackendServerToServerGroupAction();
action.serverGroupUuid = "9e9c1f7a74ce3cb6b51d4f938537f765";
action.vmNics = asList([70856dd6ee693c30b28e6233850fc494:10]);
action.servers = asList([192.168.1.1:20]);
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
AddBackendServerToServerGroupAction.Result res = action.call();
```

Python SDK

```
AddBackendServerToServerGroupAction action = AddBackendServerToSe
rverGroupAction()
action.serverGroupUuid = "9e9c1f7a74ce3cb6b51d4f938537f765"
action.vmNics = [[70856dd6ee693c30b28e6233850fc494:10]]
action.servers = [[192.168.1.1:20]]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
AddBackendServerToServerGroupAction.Result res = action.call()
```

5.4.1.11.43 RemoveBackendServerFromServerGroup

API Request

URLs

```
PUT zstack/v1/load-balancers/servergroups/{serverGroupUuid}/
backendservers/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "removeBackendServerFromServerGroup": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"removeBackendServerFromServerGroup":{}}'
http://localhost:8080/zstack/v1/load-balancers/servergroups/
af07cb06004d35b6af53aa12c8438f22/backendservers/actions
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
serverGroupUuid	String	url			4.0.0
vmNicUuids	List	body(contained in the removeBackendServerFromServerGroup structure)	Optional.		4.0.0
serverIps	List	body(contained in the removeBackendServerFromServerGroup structure)	Optional.		4.0.0
systemTags	List	body	Optional. The system tags.		4.0.0
userTags	List	body	Optional. The user tags.		4.0.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
RemoveBackendServerFromServerGroupAction action = new RemoveBackendServerFromServerGroupAction();
action.serverGroupUuid = "af07cb06004d35b6af53aa12c8438f22";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
RemoveBackendServerFromServerGroupAction.Result res = action.call();
```

Python SDK

```
RemoveBackendServerFromServerGroupAction action = RemoveBackendServerFromServerGroupAction()
action.serverGroupUuid = "af07cb06004d35b6af53aa12c8438f22"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
RemoveBackendServerFromServerGroupAction.Result res = action.call()
```

5.4.1.11.44 AddServerGroupToLoadBalancerListener

API Request

URLs

```
POST zstack/v1/load-balancers/listeners/{listenerUuid}/servergroups
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "serverGroupUuid": "05a078a03cad32a6a4c5c05f418eb27a"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"serverGroupUuid": "05a078a03cad32a6a4c5c05f418eb27a"}}'
http://localhost:8080/zstack/v1/load-balancers/listeners/
cb64a1d37cae35449ca3f9813150f073/servergroups
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
serverGroupUuid	String	body(contained in the params structure)	The UUID of the server group for load balancing.		4.0.0
listenerUuid	String	url	The UUID of the listener.		4.0.0
systemTags	List	body	Optional. The system tags.		4.0.0
userTags	List	body	Optional. The user tags.		4.0.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "2bdca7f6bea932cd8373468d971ef61f",
    "name": "Test-Listener",
    "loadBalancerUuid": "32a8cf1442b43724bef1aa2f94aa97e4",
    "instancePort": 80.0,
    "loadBalancerPort": 80.0,
    "protocol": "http"
  }
}
```

5.4.1.11.46 ChangeLoadBalancerBackendServer

API Request

URLs

```
PUT zstack/v1/load-balancers/servergroups/{serverGroupUuid}/
backendserver/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeLoadBalancerBackendServer": {
    "vmNics": [
      {
        "c1409d7fc54333d5ad3163d406620c01": "10"
      }
    ],
    "servers": [
      {
        "192.168.1.1": "20"
      }
    ]
  }
}
```

```

    ],
    "systemTags": [],
    "userTags": []
  }

```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"changeLoadBalancerBackendServer":{"vmNics":
[{"c1409d7fc54333d5ad3163d406620c01":"10"}], "servers":
[{"192.168.1.1":"20"}]}}' http://localhost:8080/zstack/v1/load-
balancers/servergroups/892bcf49ff433372952a09db93f851e6/backendserver/
actions

```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
serverGroupUuid	String	url	The UUID of the server group for load balancing.		4.0.0
vmNics	List	body(contained in the changeLoadBalancerBackendServer structure)	Optional. The VM NICs.		4.0.0
servers	List	body(contained in the changeLoadBalancerBackendServer structure)	Optional. The IP addresses of backend servers.		4.0.0
systemTags	List	body	Optional. The system tags.		4.0.0
userTags	List	body	Optional. The user tags.		4.0.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
ChangeLoadBalancerBackendServerAction action = new ChangeLoadBalancerBackendServerAction();
action.serverGroupUuid = "892bcf49ff433372952a09db93f851e6";
action.vmNics = asList([c1409d7fc54333d5ad3163d406620c01:10]);
action.servers = asList([192.168.1.1:20]);
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
ChangeLoadBalancerBackendServerAction.Result res = action.call();
```

Python SDK

```
ChangeLoadBalancerBackendServerAction action = ChangeLoadBalancerBackendServerAction()
action.serverGroupUuid = "892bcf49ff433372952a09db93f851e6"
action.vmNics = [[c1409d7fc54333d5ad3163d406620c01:10]]
action.servers = [[192.168.1.1:20]]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
ChangeLoadBalancerBackendServerAction.Result res = action.call()
```

5.4.1.11.48 CreateSlbGroup

API Request

URLs

```
POST zstack/v1/load-balancers/slb/groups
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "slbGroup",
    "slbOfferingUuid": "f66b4cd06a2d3ae985e40514502c3ea3",
```

```

    "frontEndL3NetworkUuid": "307ab51e198a35bab0bcc517f849aa46",
    "backendType": "VYOS",
    "deployType": "NoHA",
    "description": "this is a slb spec for test"
  },
  "systemTags": [],
  "userTags": []
}

```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json; charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edfb53ca0678c" \
-X POST -d '{"params":
{"name": "slbGroup", "slbOfferingUuid": "f66b4cd06a2d3ae985e40514502c3ea3", "frontEnd
is a slb spec for test"}}' http://localhost:8080/zstack/v1/load-
balancers/slb/groups

```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
name	String	body(contained in the params structure)	The name of the SLB group.		4.0.0
slbOfferingUuid	String	body(contained in the params structure)	The UUID of the SLB offering.		4.0.0
frontEndL3NetworkUuid	String	body(contained in the params structure)	The frontend L3 network UUID.		4.0.0
backendL3NetworkUuids	List	body(contained in the params structure)	Optional. The backend L3 network UUID.		4.0.0
backendType	String	body(contained in the params structure)	Optional. The backend type.	VYOS	4.0.0
deployType	String	body(contained in the params structure)	Optional. The deployment type.	- NoHA - HA	4.0.0

Name	Type	Location	Description	Valid Value	Starting Version
description	String	body(contained in the params structure)	Optional. The detailed description of the SLB group.		4.0.0
monitorIps	List	body(contained in the params structure)	Optional. The monitor ips.		5.1.0
resourceUuid	String	body(contained in the params structure)	Optional. The UUID of the SLB group.		4.0.0
tagUuids	List	body(contained in the params structure)	Optional. The tag UUIDs.		4.0.0
systemTags	List	body	Optional. The system tags.		4.0.0
userTags	List	body	Optional. The user tags.		4.0.0

API Response

Sample Response

```
{
  "inventory": {}
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.0.0
inventory	SlbGroupInventory	See inventory .	4.0.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.0.0
description	String	The brief description of the error.	4.0.0
details	String	The details about the error.	4.0.0
elaboration	String	The reserved field. Default value: null.	4.0.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.0.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.0.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The UUID of the SLB group.	4.0.0
name	String	The name of the SLB group.	4.0.0
backendType	String		4.0.0
deployType	String		4.0.0
slbOfferingUuid	String		4.0.0
description	String	The detailed description of the SLB group.	4.0.0
createDate	Timestamp	The time when the SLB group was created.	4.0.0

Name	Type	Description	Starting Version
lastOpDate	Timestamp	The time when the SLB group was last modified.	4.0.0
slbVms	List	See slbVms .	4.0.0
lbs	List	See lbs .	4.0.0
networks	List	See networks	4.0.0

#vmNics

Name	Type	Description	Starting Version
uuid	String	The NIC UUID.	4.0.0
vmInstanceUuid	String	The VM instance UUID.	4.0.0
l3NetworkUuid	String	The L3 network UUID.	4.0.0
ip	String	The IP address of the NIC.	4.0.0
mac	String	The MAC address of the NIC.	4.0.0
hypervisorType	String	The virtualization type.	4.0.0
netmask	String	The netmask.	4.0.0

Name	Type	Description	Starting Version
gateway	String	The gateway IP address.	4.0.0
metaData	String		4.0.0
ipVersion	Integer	The IP version.	4.0.0
deviceId	Integer	The device ID.	4.0.0
type	String	The NIC type.	4.0.0
createDate	Timestamp	The time when the NIC was added to the VM instance.	4.0.0
lastOpDate	Timestamp	The time when the NIC was last modified.	4.0.0
usedIps	List	See usedIps	4.0.0

#usedIps

Name	Type	Description	Starting Version
uuid	String	The IP address UUID.	4.0.0
ipRangeUuid	String	The IP range UUID.	4.0.0
l3NetworkUuid	String	The L3 network UUID.	4.0.0
ipVersion	Integer	The IP version.	4.0.0
ip	String	The IP address.	4.0.0
netmask	String	The netmask.	4.0.0
gateway	String	The gateway IP address.	4.0.0
usedFor	String		4.0.0
ipInLong	long		4.0.0
vmNicUuid	String	The VM NIC UUID.	4.0.0
createDate	Timestamp	The time when the IP address was used.	4.0.0
lastOpDate	Timestamp	The time when the was last modified.	4.0.0

#allVolumes

Name	Type	Description	Starting Version
uuid	String	The volume UUID.	4.0.0
name	String	The volume name.	4.0.0
description	String	The detailed description of the volume.	4.0.0
primaryStorageUuid	String	The primary storage UUID.	4.0.0
vmInstanceUuid	String	The bare metal instance UUID.	4.0.0
diskOfferingUuid	String	The volume offering UUID.	4.0.0
rootImageUuid	String	The root image UUID.	4.0.0
installPath	String	The installation path of the volume in the primary storage.	4.0.0
type	String	The type of the volume.	4.0.0
format	String	The format of the volume.	4.0.0
size	Long	The size of the volume.	4.0.0
actualSize	Long	The actual storage space that the volume takes up.	4.0.0
deviceId	Integer		4.0.0
state	String	The state of the volume.	4.0.0
status	String	The status of the volume.	4.0.0
createDate	Timestamp	The time when the volume was created.	4.0.0
lastOpDate	Timestamp	The time when the volume was last modified.	4.0.0

Name	Type	Description	Starting Version
isShareable	Boolean	Indicates whether the volume is shareable.	4.0.0
volumeQos	String	The QoS of the volume, for example, 1048576.	4.0.0

#vmCdRoms

Name	Type	Description	Starting Version
uuid	String	The CD-ROM UUID.	4.0.0
vmInstanceUuid	String	The VM instance UUID.	4.0.0
deviceId	Integer	The device ID.	4.0.0
isoUuid	String	The ISO image UUID.	4.0.0
isoInstallPath	String	The installation path of the ISO image.	4.0.0
name	String	The CD-ROM name.	4.0.0
description	String	The detailed description of the CD-ROM.	4.0.0
createDate	Timestamp	The time when the CD-ROM was created.	4.0.0
lastOpDate	Timestamp	The time when the CD-ROM was last modified.	4.0.0

#lbs

Name	Type	Description	Starting Version
slbGroupUuid	String		4.0.0
name	String	The name of the load balancer.	4.0.0
uuid	String	The UUID of the load balancer.	4.0.0
description	String	The detailed description of the load balancer.	4.0.0

Name	Type	Description	Starting Version
state	String		4.0.0
type	String		4.0.0
vipUuid	String	The virtual IP UUID.	4.0.0
createDate	Timestamp	The time when the oad balancer was created.	4.0.0
lastOpDate	Timestamp	The time when the load balancer was last modified.	4.0.0
listeners	List	See listeners .	4.0.0

#listeners

Name	Type	Description	Starting Version
uuid	String	The listener UUID.	4.0.0
name	String	The name of the listener.	4.0.0
description	String	The detailed description of the listener.	4.0.0
loadBalancerUuid	String	The load balancer UUID.	4.0.0
instancePort	Integer		4.0.0
loadBalancerPort	Integer		4.0.0
protocol	String		4.0.0
serverGroupUuid	String		4.0.0
createDate	Timestamp	The time when the listener was created.	4.0.0
lastOpDate	Timestamp	The time when the listener was last modified.	4.0.0
vmNicRefs	List	See vmNicRefs .	4.0.0
aclRefs	List	See aclRefs .	4.0.0
certificateRefs	List	See certificateRefs .	4.0.0
serverGroupRefs	List	See serverGroupRefs .	4.0.0

#vmNicRefs

Name	Type	Description	Starting Version
id	Long		4.0.0
listenerUuid	String		4.0.0
vmNicUuid	String	The VM NIC UUID.	4.0.0
status	String		4.0.0
createDate	Timestamp	The time when the NIC was added to the VM instance.	4.0.0
lastOpDate	Timestamp	The time when the NIC was last modified.	4.0.0

#aclRefs

Name	Type	Description	Starting Version
id	Long	The record ID.	4.0.0
listenerUuid	String	The listener UUID.	4.0.0
aclUuid	String	The UUID of the access control list (ACL).	4.0.0
type	String	The type of the ACL.	4.0.0
createDate	Timestamp	The time when the ACL was created.	4.0.0
lastOpDate	Timestamp	The time when the ACL was last modified.	4.0.0

#certificateRefs

Name	Type	Description	Starting Version
id	Long		4.0.0
listenerUuid	String		4.0.0
certificateUuid	String		4.0.0
createDate	Timestamp	The time when the certificate was created.	4.0.0

Name	Type	Description	Starting Version
lastOpDate	Timestamp	The time when the certificate was last modified.	4.0.0

#serverGroupRefs

Name	Type	Description	Starting Version
id	long		4.0.0
listenerUuid	String		4.0.0
serverGroupUuid	String		4.0.0
createDate	Timestamp	The time when the server group was created.	4.0.0
lastOpDate	Timestamp	The time when the server group was last modified.	4.0.0

#networks

Name	Type	Description	Starting Version
slbGroupUuid	String		4.0.0
I3NetworkUuid	String	The L3 network UUID.	4.0.0
I3NetworkCategory	String		4.0.0
I3NetworkType	String		4.0.0
type	String		4.0.0
createDate	Timestamp	The time when the network was created.	4.0.0
lastOpDate	Timestamp	The time when the network was last modified.	4.0.0

SDK Sample

Java SDK

```
CreateSlbGroupAction action = new CreateSlbGroupAction();
action.name = "slbGroup";
action.slbOfferingUuid = "f66b4cd06a2d3ae985e40514502c3ea3";
```

```

action.frontEndL3NetworkUuid = "307ab51e198a35bab0bcc517f849aa46";
action.backendType = "VYOS";
action.deployType = "NoHA";
action.description = "this is a slb spec for test";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateSlbGroupAction.Result res = action.call();

```

Python SDK

```

CreateSlbGroupAction action = CreateSlbGroupAction()
action.name = "slbGroup"
action.slbofferingUuid = "f66b4cd06a2d3ae985e40514502c3ea3"
action.backendType = "vyos"
action.deployType = "NoHA"
action.description = "this is a slb spec for test"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CreateSlbGroupAction.Result res = action.call()

```

5.4.1.11.49 DeleteSlbGroup

API Request

URLs

```
DELETE zstack/v1/load-balancers/slb/group/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/load-balancers/slb/group/
d0b541dcd7d230378a0d97e6c1e07d48

```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
uuid	String	url	The UUID of the SLB group		4.0.0
deleteMode	String	body	Optional. The deletion mode.	• Permissive • Enforcing	4.0.0
systemTags	List	body	Optional. The system tags.		4.0.0

Name	Type	Location	Description	Valid Value	Starting Version
userTags	List	body	Optional. The user tags.		4.0.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteSlbGroupAction action = new DeleteSlbGroupAction();
action.uuid = "d0b541dcd7d230378a0d97e6c1e07d48";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteSlbGroupAction.Result res = action.call();
```

Python SDK

```
DeleteSlbGroupAction action = DeleteSlbGroupAction()
action.uuid = "d0b541dcd7d230378a0d97e6c1e07d48"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
DeleteSlbGroupAction.Result res = action.call()
```

5.4.1.11.50 UpdateSlbGroup

API Request

URLs

```
PUT zstack/v1/load-balancers/slb/group/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateSlbGroup": {
    "name": "slb",
    "description": "slb test",
    "slbOfferingUuid": "3996416dcab833258087ac86be993858"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateSlbGroup":{"name":"slb","description":"slb test","slbOfferingUuid":"3996416dcab833258087ac86be993858"}}'
http://localhost:8080/zstack/v1/load-balancers/slb/group/
fa13412281f333469e8009c531ef9755/actions
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
uuid	String	url	The UUID of the SLB group	.	4.0.0

Name	Type	Location	Description	Valid Value	Starting Version
name	String	body(contained in the updateSlbGroup structure)	Optional. The name of the SLB group.		4.0.0
description	String	body(contained in the updateSlbGroup structure)	Optional. The detailed description of the SLB group.		4.0.0
slbOfferingUuid	String	body(contained in the updateSlbGroup structure)	Optional. The UUID of the SLB offering.		4.0.0
systemTags	List	body	Optional. The system tags.		4.0.0
userTags	List	body	Optional. The user tags.		4.0.0

API Response

Sample Response

```
{
  "inventory": {
    "name": "slb",
    "backendType": "vyos",
    "deployType": "direct",
    "description": "slb test"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.0.0

details	String	The details about the error.	4.0.0
elaboration	String	The reserved field. Default value: null.	4.0.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.0.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.0.0

#inventories

Name	Type	Description	Starting Version
management NetworkUuid	String	The management network UUID.	4.0.0

Name	Type	Description	Starting Version
zoneUuid	String	The zone UUID.	4.0.0
imageUuid	String	The image UUID.	4.0.0
uuid	String	The record UUID.	4.0.0
name	String	The name of the SLB offering.	4.0.0
description	String	The detailed description of the SLB offering.	4.0.0
cpuNum	Integer		4.0.0
cpuSpeed	Integer		4.0.0
memorySize	Long		4.0.0
type	String		4.0.0
allocatorStrategy	String		4.0.0
sortKey	Integer		4.0.0
createDate	Timestamp	The time when the SLB offering was created.	4.0.0
lastOpDate	Timestamp	The time when the SLB offering was last modified.	4.0.0
state	String		4.0.0

SDK Sample

Java SDK

```
QuerySlbOfferingAction action = new QuerySlbOfferingAction();
action.conditions = asList();
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QuerySlbOfferingAction.Result res = action.call();
```

Python SDK

```
QuerySlbOfferingAction action = QuerySlbOfferingAction()
action.conditions = []
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
QuerySlbOfferingAction.Result res = action.call()
```

5.4.1.11.54 CreateSlbInstance

API Request

URLs

```
POST zstack/v1/load-balancers/slb/instances
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "SlbInstance",
    "slbGroupUuid": "9f4fcda488f9346ca9c8ea9243d6d8e3",
    "description": "this is a slb for test"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"name":"SlbInstance","slbGroupUuid":"9f4fcda488f9346ca9c8ea9243d6d8e3","description":"this is a slb for test"}}' http://localhost:8080/zstack/v1/load-balancers/slb/instances
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
name	String	body(contained in the params structure)	The name of the SLB group .		4.0.0

Name	Type	Location	Description	Valid Value	Starting Version
slbGroupUuid	String	body(contained in the params structure)	The UUID of the SLB group .		4.0.0
description	String	body(contained in the params structure)	Optional. The detailed description of the SLB group .		4.0.0
zoneUuid	List	body(contained in the params structure)	Optional. The zone UUID		4.0.0
clusterUuid	String	body(contained in the params structure)	Optional. The cluster UUID.	• VYOS	4.0.0
hostUuid	String	body(contained in the params structure)	Optional. The host UUID.	• Direct	4.0.0
resourceUuid	String	body(contained in the params structure)	Optional. The instance UUID .		4.0.0
tagUuids	String	body(contained in the params structure)	Optional. The tag UUIDs.		4.0.0
systemTags	List	body	Optional. The system tags.		4.0.0
userTags	List	body	Optional. The user tags.		4.0.0

API Response

Sample Response

```
{
  "inventory": {}
}
```

}

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.0.0
inventory	SlbVmInstanceInventory	See inventory .	4.0.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.0.0
description	String	The brief description of the error.	4.0.0
details	String	The details about the error.	4.0.0
elaboration	String	The reserved field. Default value: null.	4.0.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.0.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.0.0

#inventory

#vmNics

Name	Type	Description	Starting Version
uuid	String	The NIC UUID.	4.0.0
vmInstanceId	String	The VM instance UUID.	4.0.0
l3NetworkUuid	String	The L3 network UUID.	4.0.0
ip	String	The IP address of the NIC.	4.0.0
mac	String	The MAC address of the NIC.	4.0.0
hypervisorType	String	The virtualization type.	4.0.0
netmask	String	The netmask.	4.0.0
gateway	String	The gateway IP address.	4.0.0
metaData	String		4.0.0
ipVersion	Integer	The IP version.	4.0.0
deviceId	Integer	The device ID.	4.0.0
type	String	The NIC type.	4.0.0

Name	Type	Description	Starting Version
createDate	Timestamp	The time when the NIC was created.	4.0.0
lastOpDate	Timestamp	The time when the NIC was last modified.	4.0.0
usedIps	List	See usedIps .	4.0.0

#usedIps

Name	Type	Description	Starting Version
uuid	String	The IP address UUID.	4.0.0
ipRangeUuid	String	The IP range UUID.	4.0.0
l3NetworkUuid	String	The L3 network UUID.	4.0.0
ipVersion	Integer	The IP version.	4.0.0
ip	String	The IP address.	4.0.0
netmask	String	The netmask.	4.0.0
gateway	String	The gateway IP address.	4.0.0
usedFor	String		4.0.0
ipInLong	long		4.0.0
vmNicUuid	String	The VM NIC UUID.	4.0.0
createDate	Timestamp	The time when the IP address was used.	4.0.0
lastOpDate	Timestamp	The time when the was last modified.	4.0.0

#allVolumes

Name	Type	Description	Starting Version
uuid	String	The volume UUID.	4.0.0
name	String	The volume name.	4.0.0
description	String	The detailed description of the volume.	4.0.0
primaryStorageUuid	String	The primary storage UUID.	4.0.0

Name	Type	Description	Starting Version
vmInstanceUuid	String	The bare metal instance UUID.	4.0.0
diskOfferingUuid	String	The volume offering UUID.	4.0.0
rootImageUuid	String	The root image UUID.	4.0.0
installPath	String	The installation path of the volume in the primary storage.	4.0.0
type	String	The type of the volume .	4.0.0
format	String	The format of the volume.	4.0.0
size	Long	The size of the volume .	4.0.0
actualSize	Long	The actual storage space that the volume takes up.	4.0.0
deviceId	Integer		4.0.0
state	String	The state of the volume.	4.0.0
status	String	The status of the volume.	4.0.0
createDate	Timestamp	The time when the volume was created.	4.0.0
lastOpDate	Timestamp	The time when the volume was last modified.	4.0.0
isShareable	Boolean	Indicates whether the volume is shareable.	4.0.0
volumeQos	String	The QoS of the volume, for example, 1048576.	4.0.0

#vmCdRoms

Name	Type	Description	Starting Version
uuid	String	The CD-ROM UUID.	4.0.0
vmInstanceUuid	String	The VM instance UUID.	4.0.0
deviceId	Integer	The device ID.	4.0.0
isoUuid	String	The ISO image UUID.	4.0.0
isoInstallPath	String	The installation path of the ISO image.	4.0.0
name	String	The CD-ROM name.	4.0.0
description	String	The detailed description of the CD-ROM.	4.0.0
createDate	Timestamp	The time when the CD-ROM was created.	4.0.0
lastOpDate	Timestamp	The time when the CD-ROM was last modified.	4.0.0

SDK Sample

Java SDK

```
CreateSlbInstanceAction action = new CreateSlbInstanceAction();
action.name = "SlbInstance";
action.slbGroupUuid = "9f4fcda488f9346ca9c8ea9243d6d8e3";

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The resource name.		0.6
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		0.6
l3NetworkUuid	String	body (contained in the params structure)	Optional. The L3 network UUID.		2.3
peerAddress	String	body (contained in the params structure)	The remote network address.		0.6
authMode	String	body (contained in the params structure)	Optional. The authentication mode.	• psk • certs	0.6
authKey	String	body (contained in the params structure)	The authentication key.		0.6
idType	String	body (contained in the params structure)	The ID configuration method.	• ip • name • fqdn	4.5.0

Name	Type	Location	Description	Optional Value	Starting Version
vipUuid	String	body (contained in the params structure)	The VIP UUID .		0.6
localId	String	body (contained in the params structure)	Optional. The local ID.		4.5.0
remoteId	String	body (contained in the params structure)	Optional. The remote ID.		4.5.0
peerCidrs	List	body (contained in the params structure)	Optional. The detination network Cidrs.		4.5.0
ikeVersion	String	body (contained in the params structure)	Optional. The IKE version.	- ike - ikev1 - ikev2	4.5.0
ikeAuthAlgorithm	String	body (contained in the params structure)	Optional. The IKE authentication algorithm.	- md5 - sha1 - sha256 - sha384 - sha512	0.6
ikeEncryptionAlgorithm	String	body (contained in the params structure)	Optional. The IKE encryption algorithm.	3des - aes-128 - aes-192 - aes-256	0.6
ikeDhGroup	int	body (contained in the params structure)	Optional. The IKE DH Group .		4.5.0
ikeLifeTime	int	body (contained in	Optional. The IKE lifetime.		4.5.0

Name	Type	Location	Description	Optional Value	Starting Version
		the params structure)			
policyAuth Algorithm	String	body (contained in the params structure)	Optional. The ESP authentication algorithm.	- md5 - sha1 - sha256 - sha384 - sha512	0.6
policyEncryptionAlgorithm	String	body (contained in the params structure)	Optional. The ESP encryption algorithm.	3des - aes-128 - aes-192 - aes-256	0.6
pfs	String	body (contained in the params structure)	Optional. The perfect forward secrecy.	- none - dh-group0 - dh-group2 - dh-group5 - dh-group14 - dh-group15 - dh-group16 - dh-group17 - dh-group18 - dh-group19 - dh-group20 - dh-group21 - dh-group22 - dh-group23 - dh-group24 - dh-group25 - dh-group26	4.5.0
policyMode	String	body (contained in the params structure)	Optional. The policy mode.	- tunnel - transport	0.6
transformProtocol	String	body (contained in	Optional. The transform protocol.	- esp - ah	0.6

Name	Type	Location	Description	Optional Value	Starting Version
		the params structure)		• ah-esp	
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		0.6
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID list.		4.5.0
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

```

5.4.1.12.2 DeleteIPsecConnection

API Request

URLs

```
DELETE zstack/v1/ipsec/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \

```

```
-X DELETE http://localhost:8080/zstack/v1/
ipsec/7176e70d92953235998cce8b486e2467
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
deleteMode	String	body	Optional. The delete mode.		4.5.0
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

Java SDK

```
QueryIPSecConnectionAction action = new QueryIPSecConnectionAction();
action.conditions = asList();
action.sessionId = "2da0145074b749de95a5f7e6197dedf5";
QueryIPSecConnectionAction.Result res = action.call();
```

Python SDK

```
QueryIPSecConnectionAction action = QueryIPSecConnectionAction()
action.conditions = []
```

```
action.sessionId = "39df08f032b9490a853c60158dee9140"
QueryIPSecConnectionAction.Result res = action.call()
```

5.4.1.12.4 UpdateIPsecConnection

API Request

URLs

```
PUT zstack/v1/ipsec/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateIPsecConnection": {
    "name": "test Ipsec",
    "description": "info",
    "deleteMode": "Permissive"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateIPsecConnection":{"name":"test
Ipsec","description":"info"}}' \
http://localhost:8080/zstack/v1/ipsec/1bcf0b898cf33f05b29edeb54a87ed82
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
name	String	body (contained in the	Optional. The resource name.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
		updateIPsecConnection structure)			
description	String	body (contained in the updateIPsecConnection structure)	Optional. The detailed description of the resource.		0.6

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		4.5.0
peerAddress	String	body (contained in the changeIPsecConnection structure)	The remote network address.		4.5.0
authMode	String	body (contained in the changeIPsecConnection structure)	Optional. The authentication mode.	- psk - certs	4.5.0

Name	Type	Location	Description	Optional Value	Starting Version
authKey	String	body (contained in the changeIPsecConnection structure)	The authentication key.		4.5.0
idType	String	body (contained in the changeIPsecConnection structure)	Optional. The ID configuration method.	- ip - name - fqdn	4.5.0
localId	String	body (contained in the changeIPsecConnection structure)	Optional. The local ID.		4.5.0
remoteId	String	body (contained in the changeIPsecConnection structure)	Optional. The remote ID.		4.5.0
ikeVersion	String	body (contained in the changeIPsecConnection structure)	Optional. The IKE version.	- ike - ikev1 - ikev2	4.5.0
ikeAuthAlgorithm	String	body (contained in the changeIPsecConnection structure)	Optional. The IKE authentication algorithm.	- md5 - sha1 - sha256 - sha384 - sha512	4.5.0

Name	Type	Location	Description	Optional Value	Starting Version
ikeEncryptionAlgorithm	String	body (contained in the changeliPse cConnection structure)	Optional. The IKE encryption algorithm.	• 3des • aes-128 • aes-192 • aes-256	4.5.0
ikeDhGroup	int	body (contained in the changeliPse cConnection structure)	Optional. The IKE DH group.		4.5.0
ikeLifeTime	int	body (contained in the changeliPse cConnection structure)	Optional. The IKE lifetime.		4.5.0
policyAuthAlgorithm	String	body (contained in the changeliPse cConnection structure)	Optional. The ESP authentication algorithm.	• md5 • sha1 • sha256 • sha384 • sha512	4.5.0
policyEncryptionAlgorithm	String	body (contained in the changeliPse cConnection structure)	Optional. The ESP encryption algorithm.	• 3des • aes-128 • aes-192 • aes-256	4.5.0
pfs	String	body (contained in the changeliPse cConnection structure)	Optional. The PFS DH Group.	• none • dh-group2 • dh-group5 • dh-group14 • dh-group15 • dh-group16 • dh-group17 • dh-group18	4.5.0

Name	Type	Location	Description	Optional Value	Starting Version
				- dh-group19 - dh-group20 - dh-group21 - dh-group22 - dh-group23 - dh-group24 - dh-group25 - dh-group26	
policyMode	String	body (contained in the changeIPsecConnection structure)	Optional. The encryption mode.	- tunnel - transport	4.5.0
transformP rotocol	String	body (contained in the changeIPsecConnection structure)	Optional. The security protocol.	- esp - ah - ah-esp	4.5.0
lifeTime	int	body (contained in the changeIPsecConnection structure)	Optional. The IPsec lifetime.		4.5.0
systemTags	List	body	Optional. The system tag.		4.5.0
userTags	List	body	Optional. The user tag.		4.5.0

```

5.4.1.12.10 AddRemoteCidrsToIPsecConnection

API Request

URLs

```
POST zstack/v1/ipsec/{uuid}/remote-cidrs
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "peerCidrs": [
      "192.168.100.0/24"
    ]
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"peerCidrs":["192.168.100.0/24"]}}' \
http://localhost:8080/zstack/v1/
ipsec/053658b061363df4be557d13ee0baaef/remote-cidrs
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.3
peerCidrs	List	body (contained in the params structure)			2.3
resourceUuid	String	body (contained in the params structure)	Optional.		2.3
systemTags	List	body	Optional. The system tags.		2.3
userTags	List	body	Optional. The user tags.		2.3

lastOpDate	Timestamp	The last operation date.	5.1.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	5.1.0
description	String	The brief description of the error.	5.1.0
details	String	The details about the error.	5.1.0
elaboration	String	The reserved field. Default value: null.	5.1.0
opaque	LinkedHashMap	The reserved field. Default value: null.	5.1.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	5.1.0

SDK Sample

Java SDK

```

CreateVpcSharedQosAction action = new CreateVpcSharedQosAction();
action.name = "sharedQos";
action.description = "sharedQos description";
action.vpcUuid = "65be8c77be7e3e548075ec8384b7784e";
action.l3NetworkUuid = "960b85b1e9933f198e342fd338badcf7";
action.bandwidth = 1048576;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";

```

```
CreateVpcSharedQosAction.Result res = action.call();
```

Python SDK

```
CreateVpcSharedQosAction action = CreateVpcSharedQosAction()
action.name = "sharedQos"
action.description = "sharedQos description"
action.vpcUuid = "65be8c77be7e3e548075ec8384b7784e"
action.l3NetworkUuid = "960b85b1e9933f198e342fd338badcf7"
action.bandwidth = 1048576
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CreateVpcSharedQosAction.Result res = action.call()
```

5.4.1.13.2 DeleteVpcSharedQos

API Request

URLs

```
DELETE zstack/v1/vips/sharedqos/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json; charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/vips/sharedqos/
ce4a4da17366304baa95bd30dbbee4be
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		5.1.0
deleteMode	String	body	Optional.	• Permissive / Enforcing • Permissive	5.1.0
systemTags	List	body	Optional. The system tags.		5.1.0
userTags	List	body	Optional. The user tags.		5.1.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteVpcSharedQosAction action = new DeleteVpcSharedQosAction();
action.uuid = "ce4a4da17366304baa95bd30dbbee4be";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteVpcSharedQosAction.Result res = action.call();
```

Python SDK

```
DeleteVpcSharedQosAction action = DeleteVpcSharedQosAction()
action.uuid = "ce4a4da17366304baa95bd30dbbee4be"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteVpcSharedQosAction.Result res = action.call()
```

5.4.1.13.3 QueryVpcSharedQos

API Request

URLs

```
GET zstack/v1/vips/sharedqos
GET zstack/v1/vips/sharedqos/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/vips/sharedqos?
q=uuid=b15a3578c3933804bece500f809ebdcc
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X GET http://localhost:8080/zstack/v1/vips/  
sharedqos/862a52a400c23d5cbccef438c957a5f8
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryVpcSharedQos`, and pressing the **Tab** key.

API Response

vpcUuid	String	The VPC vRouter UUID.	5.1.0
bandwidth	Long	The bandwidth size.	5.1.0
createDate	Timestamp	The creation time.	5.1.0
lastOpDate	Timestamp	The last operation date.	5.1.0
vips	List	See vips .	5.1.0

#vips

Name	Type	Description	Starting Version
id	Long		5.1.0
sharedQosUuid	String		5.1.0
vipUuid	String	VIP UUID	5.1.0
createDate	Timestamp	The creation time.	5.1.0
lastOpDate	Timestamp	The last operation date.	5.1.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	5.1.0
description	String	The brief description of the error.	5.1.0
details	String	The details about the error.	5.1.0
elaboration	String	The reserved field. Default value: null.	5.1.0

Name	Type	Description	Starting Version
opaque	LinkedHashMap	The reserved field. Default value: null.	5.1.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	5.1.0

SDK Sample

Java SDK

```
QueryVpcSharedQosAction action = new QueryVpcSharedQosAction();
action.conditions = asList("uuid=777d07580d263f95a881ad8523c42806");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryVpcSharedQosAction.Result res = action.call();
```

Python SDK

```
QueryVpcSharedQosAction action = QueryVpcSharedQosAction()
action.conditions = ["uuid=0b5a3b10bab03322a30cbbbcff00a17c"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryVpcSharedQosAction.Result res = action.call()
```

5.4.1.13.4 ChangeVpcSharedQos

API Request

URLs

```
POST zstack/v1/vips/sharedqos/{sharedQosUuid}/bandwidth/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

body

```
{
  "params": {

action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateVpcSharedQosAction.Result res = action.call();
```

Python SDK

```
UpdateVpcSharedQosAction action = UpdateVpcSharedQosAction()
action.uuid = "ab6601fa1df73c05a562fcde20f889ce"
action.name = "Updated Shared QoS"
action.description = "This is an updated description for the Shared QoS."
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
UpdateVpcSharedQosAction.Result res = action.call()
```

5.4.1.13.6 AttachVipToVpcSharedQos

API Request

URLs

```
POST zstack/v1/vips/sharedqos/{sharedQosUuid}/vips
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "vipLists": [
      "175767a19c2d376183863dee3408b1f6"
    ]
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
url -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"vipLists":
["175767a19c2d376183863dee3408b1f6"]}}' http://localhost:8080/zstack/
v1/vips/sharedqos/d4559c8d9f76391b9d8eb30f74698949/vips
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
sharedQosUuid	String	url			5.1.0
vipLists	List	body (contained in the params structure)			5.1.0

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	body	Optional. The system tags.		5.1.0
userTags	List	body	Optional. The user tags.		5.1.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
AttachVipToVpcSharedQosAction action = new AttachVipToVpcSharedQosAction();
action.sharedQosUuid = "d4559c8d9f76391b9d8eb30f74698949";
action.vipLists = asList("175767a19c2d376183863dee3408b1f6");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
AttachVipToVpcSharedQosAction.Result res = action.call();
```

Python SDK

```
AttachVipToVpcSharedQosAction action = AttachVipToVpcSharedQosAction()
action.sharedQosUuid = "d4559c8d9f76391b9d8eb30f74698949"
action.vipLists = [175767a19c2d376183863dee3408b1f6]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
AttachVipToVpcSharedQosAction.Result res = action.call()
```

}

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.5.0
inventory	StackTemplateInventory	See inventory .	2.5.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	2.5.0

Name	Type	Description	Starting Version
name	String	The resource name.	2.5.0
description	String	The detailed description of the resource.	2.5.0
type	String	The template content, which is a JSON string.	2.5.0
version	String	The template version.	2.5.0
state	Boolean	Whether the template is available.	2.5.0
content	String	The template content, which is a JSON string.	2.5.0
md5sum	String	The MD5 checksum value of the content field.	2.5.0
createDate	Timestamp	The creation date.	2.5.0
lastOpDate	Timestamp	The last operation date.	2.5.0

```

```
AddStackTemplateAction.Result res = action.call()
```

5.5.2 DeleteStackTemplate

API Request

URLs

```
DELETE zstack/v1/cloudformation/template/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/cloudformation/template/
dbee1e724c13eb49650b3bdf7993d7b
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.5.0
deleteMode	String	body	Optional. The delete mode.		2.5.0
systemTags	List	body	Optional. The system tags.		2.5.0
userTags	List	body	Optional. The user tags.		2.5.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DeleteStackTemplateAction action = new DeleteStackTemplateAction();
action.uuid = "dbeed1e724c13eb49650b3bdf7993d7b";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteStackTemplateAction.Result res = action.call();
```

Python SDK

```
DeleteStackTemplateAction action = DeleteStackTemplateAction()
action.uuid = "dbeed1e724c13eb49650b3bdf7993d7b"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteStackTemplateAction.Result res = action.call()
```

5.5.3 QueryStackTemplate

API Request

URLs

```
GET zstack/v1/cloudformation/template
GET zstack/v1/cloudformation/template/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/cloudformation/template?
q=name=test
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/cloudformation/
template/285b46cc67623c6d92eebc1ecab8f139
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryStackTemplate`, and pressing the **Tab** key.

API Response

Sample Response

```
{

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The template UUID.		2.5.0
name	String	body (contained in the updateStackTemplate structure)	Optional. The resource name.		2.5.0
description	String	body (contained in the updateStackTemplate structure)	Optional. The detailed description of the resource.		2.5.0

Name	Type	Location	Description	Optional Value	Starting Version
state	Boolean	body (contained in the updateStackTemplate structure)	Optional. Whether the template is available.		2.5.0
templateContent	String	body (contained in the updateStackTemplate structure)	Optional. The template content, which is a JSON string.		2.5.0
systemTags	List	body	Optional. The system tags.		2.5.0
userTags	List	body	Optional. The user tags.		2.5.0

```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.5.0
inventory	StackTemplateInventory	See inventory .	2.5.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	2.5.0
description	String	The brief description of the error.	2.5.0
details	String	The details about the error.	2.5.0
elaboration	String	The reserved field. Default value: null.	2.5.0
opaque	LinkedHashMap	The reserved field. Default value: null.	2.5.0

Name	Type	Description	Starting Version
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	2.5.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	2.5.0
name	String	The resource name.	2.5.0
description	String	The detailed description of the resource.	2.5.0
type	String	The template type. Default type: zstack.	2.5.0
version	String	The template version.	2.5.0
state	Boolean	Whether the template is available.	2.5.0
content	String	The template content, which is a JSON string.	2.5.0
createDate	Timestamp	The creation date.	2.5.0
lastOpDate	Timestamp	The last operation date.	2.5.0

5.5.5 GetSupportedCloudFormationResources

API Request

URLs

```
GET zstack/v1/cloudformation/resources
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/cloudformation/resources?
type=zstack

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
version	String	query	Optional. The template version No. For example, v1.	• v1	2.6.0
type	String	query	Optional. The template type . Default type: zstack.	• zstack	2.6.0
systemTags	List	query	Optional. The system tags.		2.6.0

Name	Type	Location	Description	Optional Value	Starting Version
userTags	List	query	Optional. The user tags.		2.6.0

API Response

Sample Response

```
{
  "resources": [
    {
      "name": "VmInstance",
      "type": "Resource",
      "actionName": "CreateVmInstanceAction",
      "resources": [
        "InstanceOffering",
        "Image",
        "L3Network",
        "DiskOffering",
        "Zone",
        "Cluster",
        "Host",
        "PrimaryStorage"
      ]
    },
    {
      "name": "AttachDataVolumeToVm",
      "type": "Action",
      "actionName": "AttachDataVolumeToVmAction",
      "resources": [
        "VmInstance",
        "Volume"
      ]
    }
  ]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.6.0
resources	List	See resources .	2.6.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	2.6.0
description	String	The brief description of the error.	2.6.0
details	String	The details about the error.	2.6.0
elaboration	String	The reserved field. Default value: null.	2.6.0
opaque	LinkedHashMap	The reserved field. Default value: null.	2.6.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	2.6.0

#resources

Name	Type	Description	Starting Version
name	String	The resource name.	2.6.0
type	String	The type, including Action and Resource.	2.6.0
actionName	String	The action name.	2.6.0
resources	List	The list of the associated resources.	2.6.0

SDK Sample

Java SDK

```

GetSupportedCloudFormationResourcesAction action = new GetSupportedCloudFormationResourcesAction();
action.type = "zstack";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";

```

```
GetSupportedCloudFormationResourcesAction.Result res = action.call();
```

Python SDK

```
GetSupportedCloudFormationResourcesAction action = GetSupportedCloudFormationResourcesAction()
action.type = "zstack"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetSupportedCloudFormationResourcesAction.Result res = action.call()
```

5.5.6 CreateResourceStack

API Request

URLs

```
POST zstack/v1/cloudformation/stack
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The resource name.		2.5.0
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		2.5.0
type	String	body (contained in the params structure)	Optional. The stack type. Default type: zstack.	zstack	2.5.0
rollback	Boolean	body (contained in the params structure)	Optional. Whether to roll back if stack creation fails. . By default, rollback is performed on failure.		2.5.0
templateContent	String	body (contained in	Optional. The stack content,		2.5.0

Name	Type	Location	Description	Optional Value	Starting Version
		the params structure)	which is a JSON string. Note: Make sure that at least one of templateContent and templateUuid is not null.		
templateUuid	String	body (contained in the params structure)	Optional. The template UUID. Note: Make sure that at least one of templateContent and templateUuid is not null.		2.5.0
parameters	String	body (contained in the params structure)	The parameters in the stack. The parameters are JSON strings.		2.5.0
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		2.5.0
systemTags	List	body	Optional. The system tags.		2.5.0
userTags	List	body	Optional. The user tags.		2.5.0

code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	2.5.0
description	String	The brief description of the error.	2.5.0
details	String	The details about the error.	2.5.0
elaboration	String	The reserved field. Default value: null.	2.5.0
opaque	LinkedHashMap	The reserved field. Default value: null.	2.5.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	2.5.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	2.5.0

Name	Type	Description	Starting Version
name	String	The resource name.	2.5.0
description	String	The detailed description of the resource.	2.5.0
version	String	The stack version.	2.5.0
type	String	The stack type. Default type: zstack.	2.5.0
templateContent	String	The stack content, which is a JSON string.	2.5.0
paramContent	String	The parameters in the stack. The parameters are JSON strings.	2.5.0
status	String	The stack status.	2.5.0
reason	String	The reason for stack creation failure.	2.5.0
enableRollback	boolean	Whether to roll back if stack creation fails.	2.5.0
createDate	Timestamp	The creation date.	2.5.0
lastOpDate	Timestamp	The last operation date.	2.5.0

SDK Sample

Java SDK

```

5.5.7 PreviewResourceStack

API Request

URLs

```
POST zstack/v1/cloudformation/stack/preview
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```

{
  "params": {
    "type": "zstack",
    "uuid": "c0c6caa3886d37709efe2c52aeefaf31",
    "parameters": "{ \"imageUuid\": \"8fcfe758a7eb13118d7344a08ff790a5\", \"instanceOfferingUuid\": \"751f662a32184933aff487f5c6e167a6\", \"l3NetworkUuid\": \"1245de5c2d28454bb63e60575ec611cb\", \"DiskOfferingUuid\": \"ad0b4ea4c747401c92a7c990f7375cf1\", \"PrimaryStorageUuid\": \"06c35e7f42264a74abb5b828367169fe\", \"HostUuid\": \"9b57690de23f449e99c8f0da311e568e\"}"
  },
  "systemTags": [],
  "userTags": []
}

```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
```

```
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"type": "zstack", "uuid": "c0c6caa3886d37709efe2c52aeefa31", "parameters": "{

localhost:8080/zstack/v1/cloudformation/stack/preview
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
type	String	body (contained in the params structure)	Optional.	• zstack	2.5.0
templateContent	String	body (contained in the params structure)	Optional. The template content.		2.5.0
uuid	String	body (contained in the params structure)	Optional. The template UUID.		2.5.0
parameters	String	body (contained in the params structure)	Optional. The parameters in the stack. The parameters are JSON strings.		2.5.0
systemTags	List	body	Optional. The system tags.		2.5.0
userTags	List	body	Optional. The user tags.		2.5.0

API Response

Sample Response

```
{
  "preview": {

    }
  }
}

```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.5.0
preview	PreviewResourceStruct	See preview .	2.5.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	2.5.0
description	String	The brief description of the error.	2.5.0
details	String	The details about the error.	2.5.0
elaboration	String	The reserved field. Default value: null.	2.5.0

Name	Type	Description	Starting Version
opaque	LinkedHashMap	The reserved field. Default value: null.	2.5.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	2.5.0

#preview

Name	Type	Description	Starting Version
conditions	Map	The action results of the conditions.	3.7.0
actions	List	See actions .	2.5.0

#actions

Name	Type	Description	Starting Version
resourceName	String	The resource type.	2.5.0
actionName	String	The action name.	2.5.0
round	int	The round (), counting from '0'.	2.5.0
inDegree	Set	The dependency action list.	2.5.0
actions	Object	The action parameters .	2.5.0

SDK Sample

Java SDK

```
PreviewResourceStackAction action = new PreviewResourceStackAction();
action.type = "zstack";
action.uuid = "c0c6caa3886d37709efe2c52aeeefa31";
action.parameters = "{  \"imageUuid\": \"8fcfe758a7eb13118d7344a08ff790a5\", \"instanceOfferingUuid\": \"751f662a32184933aff487f5c6e167a6\", \"l3NetworkUuid\": \"1245de5c2d28454bb63e60575ec611cb\", \"DiskOfferingUuid\": \"ad0b4ea4c747401c92a7c990f7375cf1\", \"PrimaryStorageUuid\": \"06c35e7f42264a74abb5b828367169fe\", \"HostUuid\": \"9b57690de23f449e99c8f0da311e568e\"}";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
PreviewResourceStackAction.Result res = action.call();
```

Python SDK

```
PreviewResourceStackAction action = PreviewResourceStackAction()
action.type = "zstack"
action.uuid = "c0c6caa3886d37709efe2c52aeeefa31"
action.parameters = "{ \"imageUuid\": \"8fcfe758a7eb13118d7344a08ff790a5\", \"instanceOfferingUuid\": \"751f662a32184933aff487f5c6e167a6\", \"l3NetworkUuid\": \"1245de5c2d28454bb63e60575ec611cb\", \"DiskOfferingUuid\": \"ad0b4ea4c747401c92a7c990f7375cf1\", \"PrimaryStorageUuid\": \"06c35e7f42264a74abb5b828367169fe\", \"HostUuid\": \"9b57690de23f449e99c8f0da311e568e\"}"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
PreviewResourceStackAction.Result res = action.call()
```

5.5.8 DeleteResourceStack

API Request

URLs

```
DELETE zstack/v1/cloudformation/stack/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/cloudformation/stack/77e576c15ef33cfcac8478e8db28f0fa
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.5.0
deleteMode	String	body	Optional.		2.5.0
systemTags	List	body	Optional. The system tags.		2.5.0
userTags	List	body	Optional. The user tags.		2.5.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteResourceStackAction action = new DeleteResourceStackAction();
action.uuid = "77e576c15ef33cfcac8478e8db28f0fa";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteResourceStackAction.Result res = action.call();
```

Python SDK

```
DeleteResourceStackAction action = DeleteResourceStackAction()
action.uuid = "77e576c15ef33cfcac8478e8db28f0fa"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteResourceStackAction.Result res = action.call()
```

5.5.9 UpdateResourceStack

API Request

URLs

```
PUT zstack/v1/cloudformation/stack/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateResourceStack": {
    "name": "stack",
    "description": "description",
    "rollback": true,
    "templateContent": "{ \"ZStackTemplateFormatVersion\" : \"2018-06-18\", \"Description\": \"Example for create a group vm instance in zstack.\", \"Parameters\" : {   \"imageUuid\" : {     \"Type\" : \"String\",     \"Description\": \"Image Uuid, represents the

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The stack UUID.		2.5.0
name	String	body (contained in the updateReso	Optional. The resource name.		2.5.0

Name	Type	Location	Description	Optional Value	Starting Version
		urceStack structure)			
description	String	body (contained in the updateReso urceStack structure)	Optional. The detailed description of the resource.		2.5.0
rollback	Boolean	body (contained in the updateReso urceStack structure)	Optional. Whether to roll back if stack creation fails.		2.5.0
templateContent	String	body (contained in the updateReso urceStack structure)	Optional. The stack content , which is a JSON string.		2.5.0
parameters	String	body (contained in the updateReso urceStack structure)	Optional. The parameters in the stack. The parameters are JSON strings.		2.5.0
systemTags	List	body	Optional. The system tags.		2.5.0
userTags	List	body	Optional. The user tags.		2.5.0

5.5.10 QueryResourceStack

API Request

URLs

```
GET zstack/v1/cloudformation/stack
GET zstack/v1/cloudformation/stack/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/cloudformation/stack?
q=name=test
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/cloudformation/
stack/071098a5d0b931758b2d96f3b947db06
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryResourceStack**, and pressing the **Tab** key.

SDK Sample

Java SDK

```
QueryEventFromResourceStackAction action = new QueryEventFromResourceStackAction();
action.conditions = asList("name=test");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryEventFromResourceStackAction.Result res = action.call();
```

Python SDK

```
QueryEventFromResourceStackAction action = QueryEventFromResourceStackAction()
action.conditions = ["name=test"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryEventFromResourceStackAction.Result res = action.call()
```

5.5.13 RestartResourceStack

API Request

URLs

```
PUT zstack/v1/cloudformation/stack/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "restartResourceStack": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"restartResourceStack":{}}' http://localhost:8080/zstack/v1/cloudformation/stack/35b245eed7fd317d8c7f2b615d70ded1/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.5.0
systemTags	List	body	Optional. The system tags.		2.5.0
userTags	List	body	Optional. The user tags.		2.5.0

API Response

action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"  
RestartResourceStackAction.Result res = action.call()
```

5.5.14 CheckStackTemplateParameters

API Request

URLs

```
POST zstack/v1/cloudformation/stack/check
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{  
  "params": {  
    "type": "zstack",  
    "uuid": "69c3bbde1b693995a5998361a7f017e7"  
  },  
  "systemTags": [],  
  "userTags": []  
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \  
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \  
-X POST -d '{"params":  
{ "type": "zstack", "uuid": "69c3bbde1b693995a5998361a7f017e7" } }' http://  
localhost:8080/zstack/v1/cloudformation/stack/check
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
type	String	body (contained in the params structure)	Optional. The template type. Default type: zstack.	zstack	2.5.0
templateContent	String	body (contained in the params structure)	Optional. The template content, which is a JSON string.		2.5.0
uuid	String	body (contained in the params structure)	The template UUID.		2.5.0
systemTags	List	body	Optional. The system tags.		2.5.0
userTags	List	body	Optional. The user tags.		2.5.0

API Response

Sample Response

```
{
  "parameters": [
    {
      "paramName": "imageUuid",
      "type": "String",
      "defaultValue": "ff1373b10ee93b15b347f7abfb4bb5b6",
      "description": "Image Uuid, represents the image resource to startup one vm instance",
      "resourceType": "Image"
    }
  ]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.5.0
parameters	List	See parameters .	2.5.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	2.5.0
description	String	The brief description of the error.	2.5.0
details	String	The details about the error.	2.5.0
elaboration	String	The reserved field. Default value: null.	2.5.0
opaque	LinkedHashMap	The reserved field. Default value: null.	2.5.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	2.5.0

#parameters

Name	Type	Description	Starting Version
paramName	String	The parameter name.	2.5.0
type	String	The parameter type.	2.5.0
defaultValue	String	The default value.	2.5.0
description	String	The detailed description of the resource.	2.5.0
noEcho	Boolean	Whether to mask the parameter value to prevent it from being displayed in the console, command line tools, or API.	2.5.0

Name	Type	Description	Starting Version
label	String	Specifies a name or description for a parameter that the frontend displays.	2.5.0
constraintDescription	String	Explains a constraint when the constraint is violated. If the verification fails, the corresponding content is returned.	2.5.0
resourceType	String	The type of a resource referenced by the event returned if the parameter is the ZStack resource. When the resource type cannot be determined, null is returned.	2.5.0

SDK Sample

Java SDK

```
CheckStackTemplateParametersAction action = new CheckStackTemplateParametersAction();
action.type = "zstack";
action.uuid = "69c3bbde1b693995a5998361a7f017e7";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CheckStackTemplateParametersAction.Result res = action.call();
```

Python SDK

```
CheckStackTemplateParametersAction action = CheckStackTemplateParametersAction()
action.type = "zstack"
action.uuid = "69c3bbde1b693995a5998361a7f017e7"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
CheckStackTemplateParametersAction.Result res = action.call()
```

5.5.15 DecodeStackTemplate

API Request

URLs

```
POST zstack/v1/cloudformation/stack/preview/resource
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.0.0
resources	List	For more information, see resources .	3.0.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.0.0
description	String	The brief description of the error.	3.0.0
details	String	The details about the error.	3.0.0
elaboration	String	The reserved field. Default value: null.	3.0.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.0.0
cause	ErrorCode	The root error, which is the associated root cause of the current	3.0.0

Name	Type	Description	Starting Version
		error. If no root error exists, this parameter is null.	

#resources

Name	Type	Description	Starting Version
resourceName	String	The resource name in the stack template.	3.0.0
resourceType	String	The resource type.	3.0.0
deletePolicy	String	The deletion policy.	3.0.0
description	String	The resource description in the stack template.	3.0.0
inDegree	Set	The dependent resources.	3.0.0
action	String	The action.	3.0.0
properties	Map	The properties.	3.0.0
results	Object	The operation results . An empty string is returned if no operation is performed .	3.0.0
created	boolean	Indicates whether the resources are created.	3.0.0
mockFailed	boolean	Indicates whether mock failed.	3.0.0
type	ResourceType	For more information, see type .	3.0.0

#type

Name	Type	Description	Starting Version
name	String	The resource type.	3.0.0
ordinal	int		3.0.0

SDK Sample

Java SDK

```
DecodeStackTemplateAction action = new DecodeStackTemplateAction();
action.type = "zstack";
action.uuid = "7628ef91277e392ca996d6457537bb45";

```

5.5.16 GetResourceStackFromResource

API Request

URLs

```
GET zstack/v1/cloudformation/resources/stack
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/cloudformation/resources/stack?resourceUuid=fad8b8f55961311a82b82a61d8b67fc5
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
resourceUuid	String	query	The resource UUID.		3.9.0
systemTags	List	query	Optional. The system tags.		3.9.0
userTags	List	query	Optional. The user tags.		3.9.0

API Response

Sample Response

```
{
  "stack": {
    "stackUuid": "4700be6752c037b69c74bd06eedf0308"
  }
}
```

Name	Type	Description	Starting Version
stack	Map	The stack.	3.9.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.9.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.9.0
description	String	The brief description of the error.	3.9.0
details	String	The details about the error.	3.9.0

Name	Type	Description	Starting Version
elaboration	String	The reserved field. Default value: null.	3.9.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.9.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.9.0

SDK Sample

Java SDK

```
GetResourceStackFromResourceAction action = new GetResourceStackFromResourceAction();
action.resourceUuid = "fad8b8f55961311a82b82a61d8b67fc5";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetResourceStackFromResourceAction.Result res = action.call();
```

Python SDK

```
GetResourceStackFromResourceAction action = GetResourceStackFromResourceAction()
action.resourceUuid = "fad8b8f55961311a82b82a61d8b67fc5"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetResourceStackFromResourceAction.Result res = action.call()
```

5.5.17 GetResourceStackVmStatus

API Request

URLs

```
GET zstack/v1/cloudformation/stack/monitor/vmstatus
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X GET http://localhost:8080/zstack/v1/cloudformation/stack/monitor/vmstatus?uuid=8f0e4af072913507a434a2c7a8bd1d0a
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	query	The resource UUID.		3.9.0
systemTags	List	query	Optional. The system tags.		3.9.0
userTags	List	query	Optional. The user tags.		3.9.0

API Response

Sample Response

```
{
  "portStatus": {}
}
```

Name	Type	Description	Starting Version
portStatus	Map	The port monitoring status. Options: open initialize close.	3.9.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.9.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.9.0

Name	Type	Description	Starting Version
description	String	The brief description of the error.	3.9.0
details	String	The details about the error.	3.9.0
elaboration	String	The reserved field. Default value: null.	3.9.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.9.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.9.0

SDK Sample

Java SDK

```
GetResourceStackVmStatusAction action = new GetResourceStackVmStatusAction();
action.uuid = "8f0e4af072913507a434a2c7a8bd1d0a";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetResourceStackVmStatusAction.Result res = action.call();
```

Python SDK

```
GetResourceStackVmStatusAction action = GetResourceStackVmStatusAction()
action.uuid = "8f0e4af072913507a434a2c7a8bd1d0a"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
GetResourceStackVmStatusAction.Result res = action.call()
```

5.5.18 AddResourceStackVmPortMonitor

API Request

URLs

```
POST zstack/v1/cloudformation/stack/monitor/addvm
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "stackUuid": "26386ffc6d43365d87aef19fdd32c6a1",
    "vmInstanceUuid": "29ddc109dd983b7fb74a7988ebbed12d",
    "port": 22.0
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"stackUuid":"26386ffc6d43365d87aef19fdd32c6a1","vmInstanceUuid":"29ddc109dd983b7
http://localhost:8080/zstack/v1/cloudformation/stack/monitor/addvm
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
stackUuid	String	body (contained in the params structure)	Optional. The stack UUID.		3.9.0

Name	Type	Location	Description	Optional Value	Starting Version
vmInstance Uuid	String	body (contained in the params structure)	The VM instance UUID		3.9.0
port	Integer	body (contained in the params structure)	The port No.		3.9.0
systemTags	List	body	Optional. The system tags.		3.9.0
userTags	List	body	Optional. The user tags.		3.9.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
AddResourceStackVmPortMonitorAction action = new AddResourceStackVmPortMonitorAction();
action.stackUuid = "26386ffc6d43365d87aef19fdd32c6a1";
action.vmInstanceUuid = "29ddc109dd983b7fb74a7988ebbed12d";
action.port = 22.0;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
AddResourceStackVmPortMonitorAction.Result res = action.call();
```

Python SDK

```
AddResourceStackVmPortMonitorAction action = AddResourceStackVmPortMonitorAction()
action.stackUuid = "26386ffc6d43365d87aef19fdd32c6a1"
action.vmInstanceUuid = "29ddc109dd983b7fb74a7988ebbed12d"
action.port = 22.0
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
AddResourceStackVmPortMonitorAction.Result res = action.call()
```

5.5.19 DeleteResourceStackVmPortMonitor

API Request

URLs

```
DELETE zstack/v1/cloudformation/stack/monitor/delvm
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/cloudformation/stack/
monitor/delvm?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
stackUuid	String	body	Optional. The stack UUID		3.9.0
vmInstance Uuid	String	body	The VM instance UUID		3.9.0
port	Integer	body	Optional. The port No.		3.9.0
deleteMode	String	body	Optional. The delete mode.		3.9.0
systemTags	List	body	Optional. The system tags.		3.9.0
userTags	List	body	Optional. The user tags.		3.9.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
```

```
"error": {
  "code": "SYS.1001",
  "description": "A message or a operation timeout",
  "details": "Create VM on KVM timeout after 300s"
}
```

SDK Sample

Java SDK

```
DeleteResourceStackVmPortMonitorAction action = new DeleteResourceStackVmPortMonitorAction();
action.stackUuid = "2683832bb7d53245acd3012da44e7fe6";
action.vmInstanceUuid = "ffa8ab9746de3edcb1bc1245eef8868d";
action.port = 22.0;
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteResourceStackVmPortMonitorAction.Result res = action.call();
```

Python SDK

```
DeleteResourceStackVmPortMonitorAction action = DeleteResourceStackVmPortMonitorAction()
action.stackUuid = "2683832bb7d53245acd3012da44e7fe6"
action.vmInstanceUuid = "ffa8ab9746de3edcb1bc1245eef8868d"
action.port = 22.0
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteResourceStackVmPortMonitorAction.Result res = action.call()
```

5.6 Bare Metal Management (Plus)

The Bare Metal Management feature is provided in a separate module. Before you can use this feature, you need to purchase the Plus License of Bare Metal Management, in addition to the Base License.

5.6.1 Bare Metal Management Operations

5.6.1.1 CreateBaremetalChassis

API Request

URLs

```
POST zstack/v1/baremetal/chassis
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "test",
    "clusterUuid": "bf598e729e61382ab2486ac40f25c425",
    "ipmiAddress": "1.1.1.1",
    "ipmiPort": "623.0",
    "ipmiUsername": "root",
    "ipmiPassword": "password"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"name":"test","clusterUuid":"bf598e729e61382ab2486ac40f25c425","ipmiAddress":"1.
http://localhost:8080/zstack/v1/baremetal/chassis
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The name of the bare metal chassis.		2.6.0

Name	Type	Location	Description	Optional Value	Starting Version
description	String	body (contained in the params structure)	Optional. The detailed description of the bare metal chassis.		2.6.0
clusterUuid	String	body (contained in the params structure)	The UUID of the cluster where the bare metal chassis resides.		2.6.0
ipmiAddress	String	body (contained in the params structure)	The IPMI address of the bare metal chassis.		2.6.0
ipmiPort	Integer	body (contained in the params structure)	Optional. The IPMI port of the bare metal chassis.		2.6.0
ipmiUsername	String	body (contained in the params structure)	The IPMI username.		2.6.0
ipmiPassword	String	body (contained in the params structure)	The IPMI password.		2.6.0
resourceUuid	String	body (contained in the params structure)	The UUID of the bare metal chassis.		2.6.0
systemTags	List	body	Optional. The system tags.		2.6.0
userTags	List	body	Optional. The user tags.		2.6.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "40fae70b4c573bdfad57d031eaba0eb0",
    "ipmiAddress": "1.1.1.1",
    "ipmiPort": 623.0,
    "ipmiUsername": "root",
    "ipmiPassword": "password",
    "state": "Enabled",
    "status": "HWInfoUnknown"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error	2.6.0
inventory	BaremetalChassisInventory	See inventory	2.6.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	2.6.0
description	String	The brief description of the error.	2.6.0
details	String	The details about the error.	2.6.0
elaboration	String	The reserved field. Default value: null.	2.6.0
opaque	LinkedHashMap	The reserved field. Default value: null.	2.6.0
cause	ErrorCode	The root error, which is the associated root	2.6.0

Name	Type	Description	Starting Version
		cause of the current error. If no root error exists, this parameter is null.	

#inventory

Name	Type	Description	Starting Version
uuid	String	The UUID of the bare metal chassis.	2.6.0
name	String	The name of the bare metal chassis.	2.6.0
description	String	The detailed description of the bare metal chassis.	2.6.0
zoneUuid	String	The zone UUID.	2.6.0
clusterUuid	String	The cluster UUID.	2.6.0
pxeServerUuid	String		3.1.1
ipmiAddress	String	The IPMI address of the bare metal chassis.	2.6.0
ipmiPort	Integer	The IPMI port of the bare metal chassis.	2.6.0
ipmiUsername	String	The IPMI username.	2.6.0
state	String		2.6.0
status	String		2.6.0
createDate	Timestamp	The time when the bare metal chassis was created.	2.6.0
lastOpDate	Timestamp	The time when the bare metal chassis was last modified.	2.6.0

SDK Sample

Java SDK

```
CreateBaremetalChassisAction action = new CreateBaremetalChassisAction();
action.name = "test";
action.clusterUuid = "bf598e729e61382ab2486ac40f25c425";
action.ipmiAddress = "1.1.1.1";
action.ipmiPort = "623.0";
action.ipmiUsername = "root";
action.ipmiPassword = "password";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateBaremetalChassisAction.Result res = action.call();
```

Python SDK

```
CreateBaremetalChassisAction action = CreateBaremetalChassisAction()
action.name = "test"
action.clusterUuid = "bf598e729e61382ab2486ac40f25c425"
action.ipmiAddress = "1.1.1.1"
action.ipmiPort = "623.0"
action.ipmiUsername = "root"
action.ipmiPassword = "password"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CreateBaremetalChassisAction.Result res = action.call()
```

5.6.1.2 DeleteBaremetalChassis

API Request

URLs

```
DELETE zstack/v1/baremetal/chassis/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/baremetal/chassis/
b4962c6429d23e93b9473f5aee202496
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The UUID of the bare metal chassis.		2.6.0
deleteMode	String	body	Optional. The mode under which the bare metal chassis is deleted.		2.6.0
systemTags	List	body	Optional. The system tags.		2.6.0
userTags	List	body	Optional. The user tags.		2.6.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteBaremetalChassisAction action = new DeleteBaremetalChassisAction
();
action.uuid = "b4962c6429d23e93b9473f5aee202496";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteBaremetalChassisAction.Result res = action.call();
```

Python SDK

```
DeleteBaremetalChassisAction action = DeleteBaremetalChassisAction()
action.uuid = "b4962c6429d23e93b9473f5aee202496"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
DeleteBaremetalChassisAction.Result res = action.call()
```

5.6.1.3 UpdateBaremetalChassis

API Request

URLs

```
PUT zstack/v1/baremetal/chassis/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateBaremetalChassis": {
    "name": "test",

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The UUID of the bare metal chassis.		2.6.0

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the updateBare metalChassis structure)	Optional. The name of the bare metal chassis.		2.6.0
description	String	body (contained in the updateBare metalChassis structure)	Optional. The detailed description of the bare metal chassis.		2.6.0
ipmiAddress	String	body (contained in the updateBare metalChassis structure)	Optional. The IPMI address of the bare metal chassis.		2.6.0
ipmiPort	Integer	body (contained in the updateBare metalChassis structure)	Optional. The IPMI port of the bare metal chassis.		2.6.0
ipmiUsername	String	body (contained in the updateBare metalChassis structure)	Optional. The IPMI username.		2.6.0
ipmiPassword	String	body (contained in the updateBare metalChassis structure)	Optional. The IPMI password.		2.6.0
systemTags	List	body	Optional. The system tags.		2.6.0

Name	Type	Location	Description	Optional Value	Starting Version
userTags	List	body	Optional. The user tags.		2.6.0

API Response

Sample Response

```
{

SDK Sample

Java SDK

```
QueryBaremetalChassisAction action = new QueryBaremetalChassisAction();
action.conditions = asList("uuid=79aa822340b2328793e624e0416cc55a");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryBaremetalChassisAction.Result res = action.call();
```

Python SDK

```
QueryBaremetalChassisAction action = QueryBaremetalChassisAction()
action.conditions = ["uuid=41375a72ff0d381fac8f50f5b8e7a27f"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryBaremetalChassisAction.Result res = action.call()
```

5.6.1.5 BatchCreateBaremetalChassis

API Request

URLs

```
POST zstack/v1/baremetal/chassis/from-file
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "baremetalChassisInfo": "FILE CONTENT ENCODE BY BASE64"
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"baremetalChassisInfo":"FILE CONTENT ENCODE BY BASE64"}}' http://localhost:8080/zstack/v1/baremetal/chassis/from-file
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
baremetalChassisInfo	String	body (contained in the params structure)	The Base64-encoded configuration file of bare metal chassis.		3.1.1
longJobName	String	body (contained in the params structure)	Optional. The name of the long job.		3.1.1
longJobDescription	String	body (contained in the params structure)	Optional. The description of the long job.		3.1.1
resourceUuid	String	body (contained in the params structure)	Optional. The UUID of the long job.		3.1.1
systemTags	List	body	Optional. The system tags.		3.1.1
userTags	List	body	Optional. The user tags.		3.1.1

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "cec9662c5cc534779833c89d8104aa7d",

    "jobData": "{\"createMessages\":[]}",
    "jobResult": "",
    "state": "Succeeded",
    "managementNodeUuid": "31c1228477b6310b9eb28a75e892b046"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error	3.1.1
inventory	LongJobInventory	See inventory	3.1.1

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.1.1
description	String	The brief description of the error.	3.1.1
details	String	The details about the error.	3.1.1
elaboration	String	The reserved field. Default value: null.	3.1.1
opaque	LinkedHashMap	The reserved field. Default value: null.	3.1.1

Name	Type	Description	Starting Version
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.1.1

#inventory

Name	Type	Description	Starting Version
uuid	String	The UUID of the API request.	3.1.1
name	String	The name of the API.	3.1.1
description	String	The detailed description of the long job.	3.1.1
apild	String	The ID of the long job.	3.1.1
jobName	String	The name of the long job.	3.1.1
jobData	String	The data about the long job.	3.1.1
jobResult	String	The result of the long job.	3.1.1
targetResourceUuid	String	The UUID of the long job.	3.1.1
managementNodeUuid	String	The UUID of the management node.	3.1.1
createDate	Timestamp	The time when the long job was created.	3.1.1
lastOpDate	Timestamp	The time when the long job was last operated.	3.1.1
state	LongJobState	See state	3.1.1

#state

Name	Type	Description	Starting Version
name	String	The name of the long job.	3.1.1
ordinal	int		3.1.1

SDK Sample

Java SDK

```
BatchCreateBaremetalChassisAction action = new BatchCreateBaremetalChassisAction();  
action.baremetalChassisInfo = "FILE CONTENT ENCODE BY BASE64";  
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";  
BatchCreateBaremetalChassisAction.Result res = action.call();
```

Python SDK

```
BatchCreateBaremetalChassisAction action = BatchCreateBaremetalChassisAction()  
action.baremetalChassisInfo = "FILE CONTENT ENCODE BY BASE64"  
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"  
BatchCreateBaremetalChassisAction.Result res = action.call()
```

5.6.1.6 CheckBaremetalChassisConfigFile

API Request

URLs

```
POST /v1/baremetal/chassis/from-file/check
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{  
  "params": {  
    "baremetalChassisInfo": "FILE CONTENT ENCODE BY BASE64"  
  },  
  "systemTags": [],  
  "userTags": []  
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"baremetalChassisInfo":"FILE CONTENT ENCODE BY BASE64"}}' http://localhost:8080/zstack/v1/baremetal/chassis/from-file/check
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
baremetalChassisInfo	String	body (contained in the params structure)	The base64-encoded configuration file of bare metal chassis.		3.1.1
systemTags	List	body	Optional. The system tags.		3.1.1
userTags	List	body	Optional. The user tags.		3.1.1

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
CheckBaremetalChassisConfigFileAction action = new CheckBaremetalChassisConfigFileAction();
action.baremetalChassisInfo = "FILE CONTENT ENCODE BY BASE64";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CheckBaremetalChassisConfigFileAction.Result res = action.call();
```

Python SDK

```
CheckBaremetalChassisConfigFileAction action = CheckBaremetalChassisConfigFileAction()
```

```

action.baremetalChassisInfo = "FILE CONTENT ENCODE BY BASE64"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CheckBaremetalChassisConfigFileAction.Result res = action.call()

```

5.6.1.7 PowerOnBaremetalChassis

API Request

URLs

```
PUT zstack/v1/baremetal/chassis/{chassisUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```

{
  "powerOnBaremetalChassis": {},
  "systemTags": [],
  "userTags": []
}

```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"powerOnBaremetalChassis":{}}'
http://localhost:8080/zstack/v1/baremetal/
chassis/7405d7ceb46634528618789cde730795/actions

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
chassisUuid	String	url	The UUID of the bare metal chassis.		2.6.0
systemTags	List	body	Optional. The system tags.		2.6.0
userTags	List	body	Optional. The user tags.		2.6.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
PowerOnBaremetalChassisAction action = new PowerOnBaremetalChassisAction();
action.chassisUuid = "7405d7ceb46634528618789cde730795";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
PowerOnBaremetalChassisAction.Result res = action.call();
```

Python SDK

```
PowerOnBaremetalChassisAction action = PowerOnBaremetalChassisAction()
action.chassisUuid = "7405d7ceb46634528618789cde730795"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
PowerOnBaremetalChassisAction.Result res = action.call()
```

5.6.1.8 PowerOffBaremetalChassis

API Request

URLs

```
PUT zstack/v1/baremetal/chassis/{chassisUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "powerOffBaremetalChassis": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"powerOffBaremetalChassis":{}}'
http://localhost:8080/zstack/v1/baremetal/chassis/
ee53c6d1f4ad3ebb8971aa5933d6f9d6/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
chassisUuid	String	url	The UUID of the bare metal chassis.		2.6.0
systemTags	List	body	Optional. The system tags.		2.6.0
userTags	List	body	Optional. The user tags.		2.6.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
PowerOffBaremetalChassisAction action = new PowerOffBaremetalChassisAction();
action.chassisUuid = "ee53c6d1f4ad3ebb8971aa5933d6f9d6";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
PowerOffBaremetalChassisAction.Result res = action.call();
```

Python SDK

```
PowerOffBaremetalChassisAction action = PowerOffBaremetalChassisAction
()
action.chassisUuid = "ee53c6d1f4ad3ebb8971aa5933d6f9d6"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
PowerOffBaremetalChassisAction.Result res = action.call()
```

5.6.1.9 PowerResetBaremetalChassis

API Request

URLs

```
PUT zstack/v1/baremetal/chassis/{chassisUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "powerResetBaremetalChassis": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"powerResetBaremetalChassis":{}}'
http://localhost:8080/zstack/v1/baremetal/
chassis/8a947fc86c0c3e1d89462722af254ddf/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
chassisUuid	String	url	The UUID of the bare metal chassis.		2.6.0

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	body	Optional. The system tags.		2.6.0
userTags	List	body	Optional. The user tags.		2.6.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
PowerResetBaremetalChassisAction action = new PowerResetBaremetalChassisAction();
action.chassisUuid = "8a947fc86c0c3e1d89462722af254ddf";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
PowerResetBaremetalChassisAction.Result res = action.call();
```

Python SDK

```
PowerResetBaremetalChassisAction action = PowerResetBaremetalChassisAction()
action.chassisUuid = "8a947fc86c0c3e1d89462722af254ddf"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
PowerResetBaremetalChassisAction.Result res = action.call()
```

5.6.1.10 GetBaremetalChassisPowerStatus

API Request

URLs

```
GET zstack/v1/baremetal/chassis/{uuid}/powerstatus
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/baremetal/
chassis/1fcf1caf5dae30f08ff995620a5bdfdd/powerstatus
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The UUID of the bare metal chassis.		2.6.0
systemTags	List	query	Optional. The system tags.		2.6.0
userTags	List	query	Optional. The user tags.		2.6.0

API Response

Sample Response

```
{
  "status": "ON"
}
```

Name	Type	Description	Starting Version
status	String	The power status of the bare metal chassis.	2.6.0

Name	Type	Description	Starting Version
success	boolean		2.6.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error	2.6.0
error	ErrorCode	See error	2.6.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	2.6.0
description	String	The brief description of the error.	2.6.0
details	String	The details about the error.	2.6.0
elaboration	String	The reserved field. Default value: null.	2.6.0
opaque	LinkedHashMap	The reserved field. Default value: null.	2.6.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	2.6.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code	2.6.0

Name	Type	Description	Starting Version
		that specifies an error . For example, SYS.1000, HOST.1001.	
description	String	The brief description of the error.	2.6.0
details	String	The details about the error.	2.6.0
elaboration	String	The reserved field. Default value: null.	2.6.0

cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	2.6.0

SDK Sample

Java SDK

```
GetBaremetalChassisPowerStatusAction action = new GetBaremetalChassisPowerStatusAction();
action.uuid = "1fcf1caf5dae30f08ff995620a5bdffd";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetBaremetalChassisPowerStatusAction.Result res = action.call();
```

Python SDK

```
GetBaremetalChassisPowerStatusAction action = GetBaremetalChassisPowerStatusAction()
action.uuid = "1fcf1caf5dae30f08ff995620a5bdffd"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
GetBaremetalChassisPowerStatusAction.Result res = action.call()
```

5.6.1.11 ChangeBaremetalChassisState

API Request

URLs

```
PUT zstack/v1/baremetal/chassis/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeBaremetalChassisState": {
    "stateEvent": "enable"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"changeBaremetalChassisState":{"stateEvent":"enable"}}'
http://localhost:8080/zstack/v1/baremetal/
chassis/1a600f11b61e3585bbd26d06166ff640/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The UUID of the bare metal chassis.		2.6.0
stateEvent	String	body (contained in the changeBare	The action taken to change the status of the	- enable - disable	2.6.0

Name	Type	Location	Description	Optional Value	Starting Version
		metalChassisState (structure)	bare metal chassis.		
systemTags	List	body	Optional. The system tags.		2.6.0
userTags	List	body	Optional. The user tags.		2.6.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "506008545fa7391cb2586ae7d6180696",
    "ipmiAddress": "1.1.1.1",

    "ipmiUsername": "root",
    "ipmiPassword": "password",
    "state": "Enabled",
    "status": "Available"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error	2.6.0
inventory	BaremetalChassisInventory	See inventory	2.6.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	2.6.0

Name	Type	Description	Starting Version
description	String	The brief description of the error.	2.6.0
details	String	The details about the error.	2.6.0
elaboration	String	The reserved field. Default value: null.	2.6.0
opaque	LinkedHashMap	The reserved field. Default value: null.	2.6.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	2.6.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The UUID of the bare metal chassis.	2.6.0
name	String	The name of the bare metal chassis.	2.6.0
description	String	The detailed description of the bare metal chassis.	2.6.0
zoneUuid	String	The zone UUID.	2.6.0
clusterUuid	String	The cluster UUID.	2.6.0
pxeServerUuid	String		3.1.1
ipmiAddress	String	The IPMI address of the bare metal chassis.	2.6.0
ipmiPort	Integer	The IPMI port of the bare metal chassis.	2.6.0
ipmiUsername	String	The IPMI username.	2.6.0
state	String		2.6.0

Name	Type	Description	Starting Version
status	String		2.6.0
createDate	Timestamp	The time when the bare metal chassis was created.	2.6.0
lastOpDate	Timestamp	The time when the bare metal chassis was last modified.	2.6.0

SDK Sample

Java SDK

```
ChangeBaremetalChassisStateAction action = new ChangeBaremetalChassisStateAction();
action.uuid = "1a600f11b61e3585bbd26d06166ff640";
action.stateEvent = "enable";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
ChangeBaremetalChassisStateAction.Result res = action.call();
```

Python SDK

```
ChangeBaremetalChassisStateAction action = ChangeBaremetalChassisStateAction()

```

http://localhost:8080/zstack/v1/baremetal/instances

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The name of the bare metal instance.		2.6.0
description	String	body (contained in the params structure)	Optional. The detailed description of the bare metal instance.		2.6.0
chassisUuid	String	body (contained in the params structure)	The UUID of the bare metal chassis.		2.6.0
imageUuid	String	body (contained in the params structure)	The image UUID.		2.6.0
templateUuid	String	body (contained in the params structure)	Optional. The UUID of the preconfigured template.		3.3.0
username	String	body (contained in the params structure)	Optional. The system user of the bare metal instance.		3.3.0
password	String	body (contained in the params structure)	Optional. The password of the bare metal instance.		2.6.0
nicCfgs	Map	body (contained in	Optional. The network		2.6.0

Name	Type	Location	Description	Optional Value	Starting Version
		the params structure)	configurations of the bare metal instance .		
bondingCfgs	Map	body (contained in the params structure)	Optional. The network bonding configurations of the bare metal instance .		3.3.0
customConfigurations	Map	body (contained in the params structure)	Optional. The custom configurations of the bare metal instance .		3.3.0
strategy	String	body (contained in the params structure)	Optional. The strategy used to create the bare metal instance.	- InstantStart - JustCreate	2.6.0
resourceUuid	String	body (contained in the params structure)	The resource UUID. If you specify this parameter, the value of this parameter is the UUID of the bare metal instance.		2.6.0
systemTags	List	body	Optional. The system tags.		2.6.0
userTags	List	body	Optional. The user tags.		2.6.0

**Note:**

- When you create a bare metal instance in ZStack Cloud, you can specify a static IP address for the bare metal instance by adding the **staticIp** option to **SystemTags**. The SystemTag is passed by using the **staticIp** parameter.
 - Format of the **staticIp** option: `staticIp::{%s}::{%s}`. Here, the first %s expression is an L3 network UUID while the second %s expression is the specified IP address.
 - Example: `staticIp::f00d593dff2e4bd58473388ac411ade2::192.168.0.10`.
- When you create a bare metal instance in ZStack Cloud, you can overwrite the installation of the bare metal instance by adding the **forceInstall** option to **SystemTags**. The SystemTag is passed by using the **forceInstall** parameter.
 - If the **forceInstall** does not exist, and if a partition is detected in the target disk during the system installation, the installation process will be paused to avoid overwriting the disk data.
 - If the **forceInstall** exists, and if a partition is detected in the target disk during the system installation, the partition will be automatically cleansed, and the installation will be overwritten.
- When you create a bare metal instance in ZStack Cloud, you can specify the switch information for by adding the **switchInfo** option to **SystemTags**. The SystemTag is passed by using the **switchInfo** parameter.
 - Format of the **switchInfo** option: `switchInfo::{%s}::{%s}`.
 - Example: `switchInfo::mac::switchInfo`.

#bmNics

Name	Type	Description	Starting Version
uuid	String	The UUID of the NIC of the bare metal instance.	2.6.0
baremetalInstanceUuid	String	The UUID of the bare metal instance.	2.6.0
l3NetworkUuid	String	The L3 network UUID.	2.6.0
baremetalBondingUuid	String	The network bonding UUID.	3.4.0

Name	Type	Description	Starting Version
mac	String	The MAC address of the bare metal instance.	2.6.0
ip	String	The IP address of the bare metal instance.	2.6.0
netmask	String	The netmask of the bare metal instance.	2.6.0
gateway	String	The gateway of the bare metal instance.	2.6.0
metadata	String		2.6.0
pxe	Boolean	Indicates whether the bare metal instance is PXE boot by using its NIC.	2.6.0
createDate	Timestamp	The time when the bare metal instance was created.	2.6.0
lastOpDate	Timestamp	The time when the bare metal instance was last modified.	2.6.0

SDK Sample

Java SDK

```
RebootBaremetalInstanceAction action = new RebootBaremetalInstanceAction();
action.uuid = "c3be8e4c6f783f0c9aec9600b2c3768";
action.pxeBoot = false;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
RebootBaremetalInstanceAction.Result res = action.call();
```

Python SDK

```
RebootBaremetalInstanceAction action = RebootBaremetalInstanceAction()
action.uuid = "c3be8e4c6f783f0c9aec9600b2c3768"
action.pxeBoot = false
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
RebootBaremetalInstanceAction.Result res = action.call()
```

5.6.1.19 DestroyBaremetalInstance

API Request

URLs

```
DELETE zstack/v1/baremetal/instances/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/baremetal/
instances/8f34148a0cce3acf883c6f6b59eb8c0d
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The UUID of the bare metal instance.		2.6.0
deleteMode	String	body	Optional. The mode under which the bare metal instance is deleted.		2.6.0
systemTags	List	body	Optional. The system tags.		2.6.0
userTags	List	body	Optional. The user tags.		2.6.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
```

```

    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}

```

SDK Sample

Java SDK

```

DestroyBaremetalInstanceAction action = new DestroyBaremetalInst
anceAction();
action.uuid = "8f34148a0cce3acf883c6f6b59eb8c0d";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DestroyBaremetalInstanceAction.Result res = action.call();

```

Python SDK

```

DestroyBaremetalInstanceAction action = DestroyBaremetalInstanceAction
()
action.uuid = "8f34148a0cce3acf883c6f6b59eb8c0d"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DestroyBaremetalInstanceAction.Result res = action.call()

```

5.6.1.20 ExpungeBaremetalInstance

API Request

URLs

```
PUT zstack/v1/baremetal/instances/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```

{
  "expungeBaremetalInstance": {},
  "systemTags": [],
  "userTags": []
}

```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"expungeBaremetalInstance":{}}'
http://localhost:8080/zstack/v1/baremetal/
instances/1016135ece1d3b189112cea52ae84d8d/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The UUID of the bare metal instance.		2.6.0
systemTags	List	body	Optional. The system tags.		2.6.0
userTags	List	body	Optional. The user tags.		2.6.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
ExpungeBaremetalInstanceAction action = new ExpungeBaremetalInstanceAction();
action.uuid = "1016135ece1d3b189112cea52ae84d8d";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
ExpungeBaremetalInstanceAction.Result res = action.call();
```

Python SDK

```
ExpungeBaremetalInstanceAction action = ExpungeBaremetalInstanceAction()
action.uuid = "1016135ece1d3b189112cea52ae84d8d"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
ExpungeBaremetalInstanceAction.Result res = action.call()
```

5.6.1.21 RecoverBaremetalInstance

API Request

URLs

```
PUT zstack/v1/baremetal/instances/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "recoverBaremetalInstance": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"recoverBaremetalInstance":{}}'
http://localhost:8080/zstack/v1/baremetal/
instances/0a71736890e437928f90415a276ca245/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The UUID of the bare metal instance.		2.6.0
systemTags	List	body	Optional. The system tags.		2.6.0
userTags	List	body	Optional. The user tags.		2.6.0

API Response

Sample Response

```

```
QueryBaremetalBondingAction action = QueryBaremetalBondingAction()
action.conditions = ["uuid=3c90a0f5fb763620ab38cc6184732ea3"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryBaremetalBondingAction.Result res = action.call()
```

5.6.1.24 AddPreconfigurationTemplate

API Request

URLs

```
POST zstack/v1/baremetal/preconfigurations
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "centos-7.2-minimal",
    "description": "centos-7.2-minimal kickstart file",
    "distribution": "centos7.2-x86_64",
    "type": "kickstart",
    "content": "..."
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X POST -d '{"params":{"name":"centos-7.2-minimal","description":"centos-7.2-minimal kickstart file","distribution":"centos7.2-x86_64","type":"kickstart","content":"..."}}' http://localhost:8080/zstack/v1/baremetal/preconfigurations
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The name of the preconfigured template.		3.4.0
description	String	body (contained in the params structure)	Optional. The detailed description of the template.		3.4.0
distribution	String	body (contained in the params structure)	The distribution of the operating system.		3.4.0
type	String	body (contained in the params structure)	The type of the template.	• kickstart • preseed • autoyast	3.4.0
content	String	body (contained in the params structure)	The content of the template.		3.4.0
resourceUuid	String	body (contained in the params structure)	Optional. The UUID of the template.		3.4.0
systemTags	List	body	Optional. The system tags.		3.4.0
userTags	List	body	Optional. The user tags.		3.4.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "0bfb87d3a9c842bbbf509a4b7eb6e3b2",
    "name": "centos_7_x86_64_mini_v1.cfg",
    "description": "centos-7-minimal kickstart file",
    "distribution": "centos-7-x86_64",
    "type": "kickstart",
    "content": "...",
    "md5sum": "0447e03f5a6747c0984842b5ee117a21",
    "isPredefined": false,
    "state": "Enabled",
    "createDate": "Jan 11, 2019 10:38:59 AM",
    "lastOpDate": "Jan 11, 2019 10:38:59 AM"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error	3.4.0
inventory	PreconfigurationTemplateInventory	See inventory	3.4.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.4.0
description	String	The brief description of the error.	3.4.0
details	String	The details about the error.	3.4.0
elaboration	String	The reserved field. Default value: null.	3.4.0

Name	Type	Description	Starting Version
opaque	LinkedHashMap	The reserved field. Default value: null.	3.4.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.4.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The UUID of the preconfigured template.	3.4.0
name	String	The name of the template.	3.4.0
description	String	The detailed description of the preconfigured template.	3.4.0
distribution	String	The distribution of the operating system.	3.4.0
type	String	The type of the template.	3.4.0
content	String	The content of the template.	3.4.0
md5sum	String	The MD5 value of the template.	3.4.0
isPredefined	Boolean	Indicates whether the system of the template was predefined.	3.4.0
state	String	The state of the template.	3.4.0
createDate	Timestamp	The time when the template was created.	3.4.0

Name	Type	Description	Starting Version
lastOpDate	Timestamp	The time when the template was last modified.	3.4.0

SDK Sample

Java SDK

```
AddPreconfigurationTemplateAction action = new AddPreconfigurationTemplateAction();
action.name = "centos-7.2-minimal";
action.description = "centos-7.2-minimal kickstart file";
action.distribution = "centos7.2-x86_64";

AddPreconfigurationTemplateAction.Result res = action.call()
```

5.6.1.25 ChangePreconfigurationTemplateState

API Request

URLs

```
PUT zstack/v1/baremetal/preconfigurations/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changePreconfigurationTemplateState": {
    "stateEvent": "disable"
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"changePreconfigurationTemplateState":
{"stateEvent":"disable"}}' http://localhost:8080/zstack/v1/baremetal/
preconfigurations/48e32bae102b30ccb921f582a33cee14/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The UUID of the template.		3.4.0
stateEvent	String	body(contained in the changePreconfigurationTemplateState structure)	The action taken to change the state of the preconfigured template.	- enable - disable	3.4.0
systemTags	List	body	Optional. The system tags.		3.4.0
userTags	List	body	Optional. The user tags.		3.4.0

API Response**Sample Response**

```
{

isPredefined	Boolean	Indicates whether the system of the template was predefined.	3.4.0
state	String	The state of the template.	3.4.0
createDate	Timestamp	The time when the template was created.	3.4.0
lastOpDate	Timestamp	The time when the template was last modified.	3.4.0

SDK Sample

Java SDK

```
ChangePreconfigurationTemplateStateAction action = new ChangePreconfigurationTemplateStateAction();
action.uuid = "48e32bae102b30ccb921f582a33cee14";
action.stateEvent = "disable";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
ChangePreconfigurationTemplateStateAction.Result res = action.call();
```

Python SDK

```
ChangePreconfigurationTemplateStateAction action = ChangePreconfigurationTemplateStateAction()
action.uuid = "48e32bae102b30ccb921f582a33cee14"
action.stateEvent = "disable"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
ChangePreconfigurationTemplateStateAction.Result res = action.call()
```

5.6.1.26 DeletePreconfigurationTemplate

API Request

URLs

```
DELETE zstack/v1/baremetal/preconfigurations/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/baremetal/
preconfigurations/5a236fbddd5e46a6ab6e634a5c8b8e68
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The UUID of the preconfigured template.		3.4.0
deleteMode	String	body	Optional. The mode under which the template is deleted.		3.4.0
systemTags	List	body	Optional. The system tags.		3.4.0
userTags	List	body	Optional. The user tags.		3.4.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeletePreconfigurationTemplateAction action = new DeletePreconfigurati
onTemplateAction();
action.uuid = "d5624ed789d14c10a35bc68f0a8c803d";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeletePreconfigurationTemplateAction.Result res = action.call();
```

Python SDK

```
DeletePreconfigurationTemplateAction action = DeletePreconfigurati
onTemplateAction()
action.uuid = "45495daa9c6542fd82a4ed00e2ce6023"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeletePreconfigurationTemplateAction.Result res = action.call()
```

5.6.1.27 UpdatePreconfigurationTemplate

API Request

URLs

```
PUT zstack/v1/baremetal/preconfigurations/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updatePreconfigurationTemplate": {
    "name": "centos-7.2-minimal",
    "description": "centos-7.2-minimal kickstart file",
    "distribution": "centos7.2-x86_64",
    "type": "kickstart",
    "content": "..."
```

```

    },
    "systemTags": [],
    "userTags": []
  }

```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updatePreconfigurationTemplate":

action.hostname = "127.0.0.1";
action.sshUsername = "root";
action.sshPassword = "password";
action.sshPort = 22.0;
action.storagePath = "/zstack_bm_cache";
action.dhcpInterface = "eth0";
action.dhcpRangeBegin = "10.0.0.1";
action.dhcpRangeEnd = "10.0.0.255";
action.dhcpRangeNetmask = "255.255.255.0";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateBaremetalPxeServerAction.Result res = action.call();
```

Python SDK

```
CreateBaremetalPxeServerAction action = CreateBaremetalPxeServerAction()
action.zoneUuid = "4d813a1e8053335d931094e4f41c0cad"
action.name = "test"
action.hostname = "127.0.0.1"
action.sshUsername = "root"
action.sshPassword = "password"
action.sshPort = 22.0
action.storagePath = "/zstack_bm_cache"
action.dhcpInterface = "eth0"
action.dhcpRangeBegin = "10.0.0.1"
action.dhcpRangeEnd = "10.0.0.255"
action.dhcpRangeNetmask = "255.255.255.0"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
CreateBaremetalPxeServerAction.Result res = action.call()
```

5.6.2.2 DeleteBaremetalPxeServer

API Request

URLs

```
DELETE zstack/v1/baremetal/pxeservers/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/baremetal/pxeservers/
da517231390c368b91440d0bda783ba1
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The UUID of the deployment server.		2.6.0
deleteMode	String	body	Optional. The mode under which the bare metal chassis is deleted.		2.6.0
systemTags	List	body	Optional. The system tags.		2.6.0
userTags	List	body	Optional. The user tags.		2.6.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
```

```

    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}

```

SDK Sample

Java SDK

```

DeleteBaremetalPxeServerAction action = new DeleteBaremetalPxeServerAction();
action.uuid = "da517231390c368b91440d0bda783ba1";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteBaremetalPxeServerAction.Result res = action.call();

```

Python SDK

```

DeleteBaremetalPxeServerAction action = DeleteBaremetalPxeServerAction()
action.uuid = "da517231390c368b91440d0bda783ba1"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteBaremetalPxeServerAction.Result res = action.call()

```

5.6.2.3 QueryBaremetalPxeServer

API Request

URLs

```

GET zstack/v1/baremetal/pxeservers
GET zstack/v1/baremetal/pxeservers/{uuid}

```

Headers

```

Authorization: OAuth the-session-uuid

```

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/baremetal/pxeservers?q=uuid=b56be5d49df637308e7db1ae725a311e

```

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/baremetal/pxeservers/fdefdaf042463cfb8939563c5f910c8f

```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryBaremetalPxeServer`, and pressing the Tab key.

API Response

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The UUID of the deployment server.		2.6.0
name	String	body (contained in the updateBaremetalPxeServer structure)	Optional. The name of the deployment server.		2.6.0
description	String	body (contained in the updateBaremetalPxeServer structure)	Optional. The detailed description of the deployment server.		2.6.0
dhcpInterface	String	body (contained in the updateBaremetalPxeServer structure)	Optional. The DHCP NIC of the deployment server.		2.6.0

Name	Type	Location	Description	Optional Value	Starting Version
dhcpRangeBegin	String	body (contained in the updateBare metalPxeServer structure)	Optional. The starting IP address that DHCP assigns to a bare metal instance.		2.6.0
dhcpRangeEnd	String	body (contained in the updateBare metalPxeServer structure)	Optional. The ending IP address that DHCP assigns to a bare metal instance.		2.6.0
dhcpRangeNetmask	String	body (contained in the updateBare metalPxeServer structure)	Optional. The netmask of the IP range from which the DHCP server assigns an IP address to a bare metal instance.		2.6.0
systemTags	List	body	Optional. The system tags.		2.6.0
userTags	List	body	Optional. The user tags.		2.6.0

```

5.6.2.7 ReconnectBaremetalPxeServer

API Request

URLs

```
PUT zstack/v1/baremetal/pxeservers/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "reconnectBaremetalPxeServer": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"reconnectBaremetalPxeServer":{}}'
http://localhost:8080/zstack/v1/baremetal/
pxeservers/65273a162ba83a4d99abc6ede60e6eeb/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The UUID of the deployment server.		3.1.1
systemTags	List	body	Optional. The system tags.		3.1.1
userTags	List	body	Optional. The user tags.		3.1.1

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "95c83db8181c31ea84f2ed95b3800501",
    "name": "test",

    "dhcpRangeNetmask": "255.255.255.0",
    "state": "Enabled",
    "status": "Connected"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error	3.1.1
inventory	BaremetalPxeServerInventory	See inventory	3.1.1

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.1.1
description	String	The brief description of the error.	3.1.1
details	String	The details about the error.	3.1.1
elaboration	String	The reserved field. Default value: null.	3.1.1

Name	Type	Description	Starting Version
opaque	LinkedHashMap	The reserved field. Default value: null.	3.1.1
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.1.1

#inventory

Name	Type	Description	Starting Version
uuid	String	The UUID of the deployment server.	3.1.1
zoneUuid	String	The zone UUID.	3.1.1
name	String	The name of the deployment server.	3.1.1
description	String	The detailed description of the deployment server.	3.1.1
hostname	String	The IP address of the deployment server.	3.1.1
sshUsername	String	The SSH username of the deployment server.	3.1.1
sshPassword	String	The SSH password of the deployment server.	3.1.1
sshPort	Integer	The SSH port of the deployment server.	3.1.1
storagePath	String	The storage path of the deployment server.	3.1.1
dhcpInterface	String	The DHCP NIC of the deployment server.	3.1.1
dhcpRangeBegin	String	The starting IP address that DHCP assigns to a bare metal instance.	3.1.1

Name	Type	Description	Starting Version
dhcpRangeEnd	String	The ending IP address that DHCP assigns to a bare metal instance.	3.1.1
dhcpRangeNetmask	String	The netmask of the IP range from which DHCP assigns an IP address to a bare metal instance.	3.1.1
state	String	The operating status of the deployment server.	3.1.1
status	String	The connection status of the deployment server.	3.1.1
createDate	Timestamp	The time when the deployment server was created.	3.1.1
lastOpDate	Timestamp	The time when the deployment server was last modified.	3.1.1
totalCapacity	Long	The total storage capacity in the specified storage path.	3.1.1
availableCapacity	Long	The available storage space in the specified storage path.	3.1.1
attachedClusterUuids	List	The UUIDs of the clusters to which the deployment server is attached.	3.1.1

SDK Sample

Java SDK

```
ReconnectBaremetalPxeServerAction action = new ReconnectBaremetalPxeServerAction();
action.uuid = "65273a162ba83a4d99abc6ede60e6eeb";

5.7 Elastic Bare Metal Management(Plus)

The Elastic Bare Metal Management feature is provided in a separate module. Before you can use this feature, you need to purchase the Plus License of Elastic Bare Metal Management, in addition to the Base License.

5.7.1 GetAccessPath

API Request

URLs

```
GET zstack/v1/block-volumes/access/path/
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8"
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c"
-X GET http://localhost:8080/zstack/v1/block-volumes/access/path?
primaryStorageUuid=56963d0046b330839488e795b5109e44
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	query	Optional. The system tags.		4.7.11
userTags	List	query	Optional. The user tags.		4.7.11
primaryStorageUuid	String	query	The primary storage UUID.		4.7.11

API Response

Response Sample

```
{
  "pathInfos": [
    {
      "accessPathId": 1,
      "accessPathIqn": "iqn",
      "targetCount": 1
    }
  ]
}
```

Name	Type	Description	Starting Version
success	boolean		4.7.11
inventory	VolumeInventory	See pathInfos .	4.7.11

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.7.11

#pathInfos

Name	Type	Description	Starting Version
name	String	The resource name.	4.7.11
accessPathId	String	The access path id.	4.7.11
accessPathIqn	String	The access path iqn.	4.7.11
targetCount	Integer	The target count.	4.7.11
gatewayIps	List	The gateway IPs.	4.7.11

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error	0.6

Name	Type	Description	Starting Version
		exists, this parameter is null.	

SDK Sample

Java SDK

```
CreateBlockVolumeAction action = new CreateBlockVolumeAction();
action.name = "example";
action.description = "block volume test";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateBlockVolumeAction.Result res = action.call();
```

Python SDK

```
CreateBlockVolumeAction action = CreateBlockVolumeAction()
action.name = "example"
action.description = "block volume test"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CreateBlockVolumeAction.Result res = action.call()
```

5.7.2 CreateBlockVolume

API Request

URLs

```
POST zstack/v1/block-volumes
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "example",
    "description": "block volume test"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8"
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c"
-X POST -d '{"params":{"name":"example","description":"block volume
test"}}'
http://localhost:8080/zstack/v1/block-volumes
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The resource name.		4.7.11
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		4.7.11
size	Long	body (contained in the params structure)	The size.		4.7.11
primaryStorageUuid	String	body (contained in the params structure)	The primary storage UUID.		4.7.11
accessPathId	Integer	body (contained in the params structure)	Optional. The access path id.		5.1.0
accessPathIqn	String	body (contained in the params structure)	Optional. The access path iqn.		4.7.11
burstTotalBw	Long	body (contained in the params structure)	Optional. The burst total bandwidth.		4.7.11

Name	Type	Location	Description	Optional Value	Starting Version
burstTotalIops	Long	body (contained in the params structure)	Optional. The burst total IOPS.		4.7.11
maxTotalBw	Long	body (contained in the params structure)	Optional. The maximum total bandwidth.		4.7.11
maxTotalIops	Long	body (contained in the params structure)	Optional. The maximum total IOPS.		4.7.11
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		4.7.11
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID list.		4.7.11
systemTags	List	body	Optional. The system tags.		4.7.11
userTags	List	body	Optional. The user tags.		4.7.11
protocol	String		Optional. The protocol.		5.1.0

API Response

Response Sample

```
{
  "inventory": {}
}
```

Name	Type	Description	Starting Version
success	boolean		4.7.11
inventory	VolumeInventory	See inventory .	4.7.11

lastDetachDate	Timestamp		4.7.11
lastVmInstanceUuid	String		4.7.11

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	4.7.0
description	String	The brief description of the error.	4.7.0
details	String	The details about the error.	4.7.0
elaboration	String	The reserved field. Default value: null.	4.7.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.7.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.7.0

SDK Sample

Java SDK

```
CreateBlockVolumeAction action = new CreateBlockVolumeAction();
action.name = "example";
action.description = "block volume test";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
CreateBlockVolumeAction.Result res = action.call();
```

Python SDK

```
CreateBlockVolumeAction action = CreateBlockVolumeAction()
action.name = "example"
action.description = "block volume test"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CreateBlockVolumeAction.Result res = action.call()
```

5.7.3 AddStorageProtocol

API Request

URLs

```
POST zstack/v1/primary-storage/protocol
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "uuid": "68c75f0058b93c61b30188e37b8fc5e9",
    "outputProtocol": "iSCSI"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"uuid":"68c75f0058b93c61b30188e37b8fc5e9","outputProtocol":"iSCSI"}}'
http://localhost:8080/zstack/v1/primary-storage/protocol
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	body (contained in the params structure)	The resource UUID.		5.1.0
outputProtocol	String	body (contained in the params structure)	The output protocol.		5.1.0
systemTags	List	body	Optional. The system tags.		5.1.0
userTags	List	body	Optional. The user tags.		5.1.0

API Response

Response Sample

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
AddStorageProtocolAction action = new AddStorageProtocolAction();
action.uuid = "68c75f0058b93c61b30188e37b8fc5e9";
action.outputProtocol = "iSCSI";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
AddStorageProtocolAction.Result res = action.call();
```

Python SDK

```
AddStorageProtocolAction action = AddStorageProtocolAction()
action.uuid = "68c75f0058b93c61b30188e37b8fc5e9"
action.outputProtocol = "iSCSI"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
AddStorageProtocolAction.Result res = action.call()
```

5.7.4 UpdateXskyBlockVolume

API Request

URLs

```
PUT zstack/v1/xsky/block-volumes/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateXskyBlockVolume": {
    "name": "example"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8"
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c"
-X PUT -d '{"updateXskyBlockVolume":{"name":"example"}}'
http://localhost:8080/zstack/v1/xsky/block-volumes/
eeb07fe1a24833959f75c38b9c7e4132/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		4.7.11
name	String	body (contained in the updateXsky	The resource name.		4.7.11

Name	Type	Location	Description	Optional Value	Starting Version
		BlockVolume structure)			
description	String	body (contained in the updateXsky BlockVolume structure)	Optional. The detailed description of the resource.		4.7.11
burstTotalBw	Long	body (contained in the updateXsky BlockVolume structure)	Optional.		4.7.11
burstTotallops	Long	body (contained in the updateXsky BlockVolume structure)	Optional.		4.7.11
maxTotalBw	Long	body (contained in the updateXsky BlockVolume structure)	Optional.		4.7.11
maxTotallops	Long	body (contained in the updateXsky BlockVolume structure)	Optional.		4.7.11
systemTags	List	body	Optional. The system tags.		4.7.11
userTags	List	body	Optional. The user tags.		4.7.11

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
UpdateXskyBlockVolumeAction action = new UpdateXskyBlockVolumeAction
();
action.uuid = "eeb07fe1a24833959f75c38b9c7e4132";
action.name = "example";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateXskyBlockVolumeAction.Result res = action.call();
```

Python SDK

```
UpdateXskyBlockVolumeAction action = UpdateXskyBlockVolumeAction()
action.uuid = "eeb07fe1a24833959f75c38b9c7e4132"
action.name = "example"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateXskyBlockVolumeAction.Result res = action.call()
```

5.7.5 QueryXskyBlockVolume

API Request

URLs

```
GET zstack/v1/xsky/block-volumes
GET zstack/xsky/block-volumes/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8"
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c"
-X GET http://localhost:8080/zstack/v1/xsky/block-volumes?
q=uuid=xxx&q=name=xxx
```

```
curl -H "Content-Type: application/json;charset=UTF-8"
```

```
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c"
-X GET http://localhost:8080/zstack/v1/xsky/block-
volumes/54e1b033658b3aa28536d0064c07c536
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryXskyBlockVolume`, and pressing the **Tab** key.

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
QueryXskyBlockVolumeAction action = new QueryXskyBlockVolumeAction();
action.conditions = asList("uuid=xxx", "name=xxx");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryXskyBlockVolumeAction.Result res = action.call();
```

Python SDK

```
QueryXskyBlockVolumeAction action = QueryXskyBlockVolumeAction()
action.conditions = ["uuid=xxx", "name=xxx"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryXskyBlockVolumeAction.Result res = action.call()
```

5.7.6 QueryExponBlockVolume

API Request

URLs

```
GET zstack/v1/expon/block-volumes
```

```
GET zstack/v1/expon/block-volumes/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/expon/block-volumes?
q=uuid=xxx&q=name=xxx
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/expon/block-
volumes/57dcd9124665304191c221331ee95e6b
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryXskyBlockVolume`, and pressing the **Tab** key.

SDK Sample

Java SDK

```
QueryXskyBlockVolumeAction action = new QueryXskyBlockVolumeAction();
action.conditions = asList("uuid=xxx", "name=xxx");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryXskyBlockVolumeAction.Result res = action.call();
```

Python SDK

```
QueryXskyBlockVolumeAction action = QueryXskyBlockVolumeAction()
action.conditions = ["uuid=xxx", "name=xxx"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryXskyBlockVolumeAction.Result res = action.call()
```

5.7.7 DeleteBareMetal2Chassis

API Request

URLs

```
DELETE zstack/v1/baremetal2/chassis/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/baremetal2/
chassis/3f793d991a023499bda3e179e6910317
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
uuid	String	url	The UUID of the bare metal chassis.		4.0.0
deleteMode	String	body	Optional. The deletion mode.	• Permissive • Enforcing	4.0.0
systemTags	List	body	Optional. The system tags.		4.0.0
userTags	List	body	Optional. The user tags.		4.0.0

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteBareMetal2ChassisAction action = new DeleteBareMetal2ChassisAction();
action.uuid = "3f793d991a023499bda3e179e6910317";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteBareMetal2ChassisAction.Result res = action.call();
```

Python SDK

```
DeleteBareMetal2ChassisAction action = DeleteBareMetal2ChassisAction()
action.uuid = "3f793d991a023499bda3e179e6910317"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
DeleteBareMetal2ChassisAction.Result res = action.call()
```

5.7.8 UpdateBareMetal2Chassis

API Request

URLs

```
PUT zstack/v1/baremetal2/chassis/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateBareMetal2Chassis": {
    "name": "NEW_BM_CHASSIS",
    "description": "This is a new bare metal chassis."
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateBareMetal2Chassis":
{"name":"NEW_BM_CHASSIS","description":"This is a new bare
metal chassis."}}' http://localhost:8080/zstack/v1/baremetal2/
chassis/4e99972d89a63a9fa061971a3267374f/actions
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
uuid	String	url	The UUID of the bare metal chassis.		4.0.0
name	String	body(contained in the updateBare	Optional. The name of the		4.0.0

  }
}
```

Name	Type	Description	Starting Version
success	boolean		4.3.6
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.0.0
inventory	BaremetalChassisInventory	See inventory .	4.0.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.0.0
description	String	The brief description of the error.	4.0.0
details	String	The details about the error.	4.0.0
elaboration	String	The reserved field. Default value: null.	4.0.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.0.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.0.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The UUID of the bare metal chassis.	4.0.0
name	String	The name of the bare metal chassis.	4.0.0
description	String	The detailed description of the bare metal chassis.	4.0.0
zoneUuid	String	The zone UUID.	4.0.0
clusterUuid	String	The cluster UUID.	4.0.0
chassisOfferingUuid	String	The chassis offering UUID.	4.0.0

Name	Type	Description	Starting Version
type	String	The type of the protocol used to control bare metal chassis and instances.	4.0.0
state	String	The state of the chassis.	4.0.0
status	String	The distribution status of the chassis.	4.0.0
powerStatus	String	The power status of the chassis.	4.0.0
createDate	Timestamp	The time when the chassis was added to the cluster.	4.0.0
lastOpDate	Timestamp	The time when the chassis was last modified.	4.0.0
chassisNics	List	See chassisNics .	4.0.0
chassisDisks	List	See chassisDisks .	4.0.0
chassisOffering	BareMetal2ChassisOfferingInventory	See chassisOffering .	4.0.0

#chassisNics

Name	Type	Description	Starting Version
uuid	String	The UUID of the bare metal chassis NIC.	4.0.0
chassisUuid	String	The UUID of the bare metal chassis.	4.0.0
mac	String	The MAC address of the chassis NIC.	4.0.0
speed	String	The data rate of the chassis NIC.	4.0.0
isProvisionNic	Boolean	Indicates whether the NIC is a provisioned NIC.	4.0.0

Name	Type	Description	Starting Version
createDate	Timestamp	The time when the NIC was created.	4.0.0
lastOpDate	Timestamp	The time when the NIC was last modified.	4.0.0

#chassisDisks

Name	Type	Description	Starting Version
uuid	String	The UUID of the chassis disk.	4.0.0
chassisUuid	String	The chassis UUID.	4.0.0
diskSize	Long	The size of the disk storage space, in bytes.	4.0.0
type	String	The type of the disk.	4.0.0
createDate	Timestamp	The time when the disk was created.	4.0.0
lastOpDate	Timestamp	The time when the disk was last modified.	4.0.0

#chassisOffering

Name	Type	Description	Starting Version
uuid	String	The chassis offering UUID.	4.0.0
name	String	The name of the chassis offering.	4.0.0
description	String	The detailed description of the chassis offering.	4.0.0
architecture	String	The CPU architecture.	4.0.0
cpuModelName	String	The CPU model name.	4.0.0
cpuNum	Integer	The number of CPU cores.	4.0.0
memorySize	Long	The memory size.	4.0.0

Name	Type	Description	Starting Version
bootMode	String	The boot mode.	4.0.0
state	String	The state of the chassis offering.	4.0.0
createDate	Timestamp	The time when the chassis offering was created.	4.0.0
lastOpDate	Timestamp	The time when the chassis offering was last modified.	4.0.0

SDK Sample

Java SDK

```
UpdateBareMetal2ChassisAction action = new UpdateBareMetal2ChassisAction();
action.uuid = "4e99972d89a63a9fa061971a3267374f";

iommuGroup	String		5.1.8
name	String	The resource name.	5.1.8
vendor	String		5.1.8
device	String		5.1.8
createDate	Timestamp	The creation date.	5.1.8
lastOpDate	Timestamp	The last operation date.	5.1.8

SDK Sample

Java SDK

```
QueryBareMetal2ChassisGpuDeviceAction action = new QueryBareMetal2ChassisGpuDeviceAction();
action.conditions = asList();
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryBareMetal2ChassisGpuDeviceAction.Result res = action.call();
```

Python SDK

```
QueryBareMetal2ChassisGpuDeviceAction action = QueryBareMetal2ChassisGpuDeviceAction()
action.conditions = []
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
QueryBareMetal2ChassisGpuDeviceAction.Result res = action.call()
```

5.7.10 QueryBareMetal2ChassisPciDevice

API Request

URLs

```
GET zstack/v1/baremetal2/chassis/pci-device/pci-devices
```

```
GET zstack/v1/baremetal2/chassis/pci-device/pci-devices/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/baremetal2/chassis/pci-device/
pci-devices?
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/baremetal2/chassis/pci-device/
pci-devices/a2c7298ca3b53d7da79988705ce21ec3
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryBareMetal2ChassisGpuDevice`, and pressing the **Tab** key.

5.7.11 GetBareMetal2SupportedBootMode

API Request

URLs

```
GET /v1/baremetal2/chassis/supported-boot-modes
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/baremetal2/chassis/supported-
boot-modes
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
systemTags	List	query	Optional. The system tags.		4.0.0
userTags	List	query	Optional. The user tags.		4.0.0

API Response

Sample Response

```
{
  "supportedBootMode": "UEFI"
}
```

Name	Type	Description	Starting Version
supportedBootMode	String	The supported boot mode.	4.0.0
success	boolean	Indicates whether the API request succeeded.	4.0.0
error	ErrorCode	The error code. If not null, the operation	4.0.0

Name	Type	Description	Starting Version
		fails, or vice versa. For more information, see error .	

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.0.0
description	String	The brief description of the error.	4.0.0
details	String	The details about the error.	4.0.0
elaboration	String	The reserved field. Default value: null.	4.0.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.0.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.0.0

SDK Sample

Java SDK

```

```

5.7.15 PowerOffBareMetal2Chassis

API Request

URLs

```
PUT zstack/v1/baremetal2/chassis/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "powerOffBareMetal2Chassis": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json; charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"powerOffBareMetal2Chassis":{}}'
http://localhost:8080/zstack/v1/baremetal2/chassis/
d6e50887e1a6309c85e2f61aa2669c09/actions
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
uuid	String	url	The UUID of the bare metal chassis.		4.0.0
systemTags	List	body	Optional. The system tags.		4.0.0
userTags	List	body	Optional. The user tags.		4.0.0

API Response

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
ipmiAddress	String	body(contained in the params structure)	The IPMI address.		4.0.0
ipmiPort	Integer	body(contained in the params structure)	Optional. The IPMI port.		4.0.0
ipmiUsername	String	body(contained in the params structure)	The IPMI username.		4.0.0
ipmiPassword	String	body(contained in the params structure)	The IPMI password.		4.0.0
name	String	body(contained in the params structure)	The name of the bare metal chassis.		4.0.0
description	String	body(contained in the params structure)	Optional. The detailed description of the bare metal chassis.		4.0.0
clusterUuid	String	body(contained in the params structure)	The cluster UUID.		4.0.0
resourceUuid	String	body(contained in the params structure)	Optional. The chassis UUID .		4.0.0
provisionType	String	body(contained in the params structure)	Optional. The startup method.	• Remote • Local • Direct	4.3.12
tagUuids	List	body(contained in the params structure)	Optional. The tag UUIDs.		4.0.0
systemTags	List	body	Optional. The system tags.		4.0.0

Name	Type	Location	Description	Valid Value	Starting Version
userTags	List	body	Optional. The user tags.		4.0.0

**Note:**

- When you add a baremetal node of the local disk (non take-over) type on ZStack Cloud, you can record the local system information by adding **chassisPlatform** to the **SystemTags** to **chassisPlatform** option.
 - Format: chassisPlatform::system type
 - Example: chassisPlatform::Windows

```

5.7.22 CheckBareMetal2IpmiChassisConfigFile

API Request

URLs

```
POST zstack/v1/baremetal2/chassis/ipmi/from-file/check
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "chassisInfo": "FILE CONTENT ENCODE BY BASE64"
  },
}
```

```
"systemTags": [],
"userTags": []
}
```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"chassisInfo":"FILE CONTENT ENCODE BY
BASE64"}}' http://localhost:8080/zstack/v1/baremetal2/chassis/ipmi/
from-file/check
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
chassisInfo	String	body(contained in the params structure)	The base64 -encoded configuration file of bare metal chassis.		4.0.0
systemTags	List	body	Optional. The system tags.		4.0.0
userTags	List	body	Optional. The user tags.		4.0.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
CheckBareMetal2IpmiChassisConfigFileAction action = new CheckBareMetal2IpmiChassisConfigFileAction();
action.chassisInfo = "FILE CONTENT ENCODE BY BASE64";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CheckBareMetal2IpmiChassisConfigFileAction.Result res = action.call();
```

Python SDK

```
CheckBareMetal2IpmiChassisConfigFileAction action = CheckBareMetal2IpmiChassisConfigFileAction()
action.chassisInfo = "FILE CONTENT ENCODE BY BASE64"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CheckBareMetal2IpmiChassisConfigFileAction.Result res = action.call()
```

5.7.23 CreateBareMetal2IpmiChassisHardwareInfo

API Request

URLs

```
POST zstack/v1/baremetal2/chassis/ipmi/hardwareinfos
```

Body

```
{
  "params": {
    "ipmiAddress": "192.168.0.10",
    "ipmiPort": 623.0,
    "hardwareInfo": "{\u0027architecture\u0027:\u0027x86_64\u0027,\u0027cpuModelName\u0027:\u0027Intel i7-6700K\u0027,\u0027cpuNum\u0027:\u00272\u0027,\u0027memorySize\u0027:\u002733421254656\u0027,\u0027nics\u0027:[{\u0027nicMac\u0027:\u00278d:5c:f7:8d:61\u0027,\u0027nicSpeed\u0027:\u00271000Mbps\u0027,\u0027isProvisionNic\u0027:\u0027true\u0027}]]}"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \

systemTags	List	body	Optional. The system tags.		4.0.0
userTags	List	body	Optional. The user tags.		4.0.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
CreateBareMetal2IpmiChassisHardwareInfoAction action = new CreateBareMetal2IpmiChassisHardwareInfoAction();
action.ipmiAddress = "192.168.0.10";
action.ipmiPort = 623.0;
action.hardwareInfo = "{ 'architecture': 'x86_64', 'cpuModelName': 'Intel i7-6700K', 'cpuNum': '8', 'memorySize': '33421254656', 'nics': [{ 'nicMac': '40:8d:5c:f7:8d:61', 'nicSpeed': '1000Mbps', 'isProvisionNic': 'true' }] }";
CreateBareMetal2IpmiChassisHardwareInfoAction.Result res = action.call();
```

Python SDK

```
CreateBareMetal2IpmiChassisHardwareInfoAction action = CreateBareMetal2IpmiChassisHardwareInfoAction()
action.ipmiAddress = "192.168.0.10"
action.ipmiPort = 623.0
action.hardwareInfo = "{ 'architecture': 'x86_64', 'cpuModelName': 'Intel i7-6700K', 'cpuNum': '8', 'memorySize': '33421254656', 'nics': [{ 'nicMac': '40:8d:5c:f7:8d:61', 'nicSpeed': '1000Mbps', 'isProvisionNic': 'true' }] }"
CreateBareMetal2IpmiChassisHardwareInfoAction.Result res = action.call()
```

5.7.24 UpdateBareMetal2ChassisOffering

API Request

URLs

```
PUT zstack/v1/baremetal2/chassis/offerings/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateBareMetal2ChassisOffering": {
    "name": "new-offering-name",
    "description": "new-offering-description"
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateBareMetal2ChassisOffering":{"name":"new-offering-name","description":"new-offering-description"}}'
http://localhost:8080/zstack/v1/baremetal2/chassis/offerings/530ce92eb98a345ba74cc0f7fae932aa/actions
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
uuid	String	url	The UUID of the bare metal chassis offering.		4.0.0
name	String	body(contained in the updateBareMetal2ChassisOffering structure)	Optional. The name of the bare metal chassis offering.		4.0.0
description	String	body(contained in the updateBareMetal2ChassisOffering structure)	Optional. The detailed description of the bare metal chassis offering.		4.0.0
systemTags	List	body	Optional. The system tags.		4.0.0
userTags	List	body	Optional. The user tags.		4.0.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "4f1b206549984f77a170a776ed62dd52",
    "name": "BM-8C-8G",
    "description": "This is bare metal instance offering.",
    "architecture": "x86_64",
    "cpuModelName": "Intel(R) Core(TM) i7-6700K CPU @ 4.00GHz",
    "cpuNum": 8.0,
    "memorySize": 8.589934592E9,
    "bootMode": "UEFI",
    "state": "Enabled",
    "createDate": "Nov 14, 2017 10:20:57 PM",
    "lastOpDate": "Nov 14, 2017 10:20:57 PM"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.0.0
inventory	BareMetal2ChassisOfferingInventory	See inventory .	4.0.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.0.0
description	String	The brief description of the error.	4.0.0
details	String	The details about the error.	4.0.0
elaboration	String	The reserved field. Default value: null.	4.0.0

Name	Type	Description	Starting Version
opaque	LinkedHashMap	The reserved field. Default value: null.	4.0.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.0.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The chassis offering UUID.	4.0.0
name	String	The name of the chassis offering.	4.0.0
description	String	The detailed description of the chassis offering.	4.0.0
architecture	String	The CPU architecture.	4.0.0
cpuModelName	String	The CPU model name.	4.0.0
cpuNum	Integer	The number of CPU cores.	4.0.0
memorySize	Long	The memory size.	4.0.0
bootMode	String	The boot mode.	4.0.0
state	String	The state of the chassis offering.	4.0.0
createDate	Timestamp	The time when the chassis offering was created.	4.0.0
lastOpDate	Timestamp	The time when the chassis offering was last modified.	4.0.0

SDK Sample

Java SDK

```
UpdateBareMetal2ChassisOfferingAction action = new UpdateBareMetal2ChassisOfferingAction();
action.uuid = "530ce92eb98a345ba74cc0f7fae932aa";
action.name = "new-offering-name";
action.description = "new-offering-description";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateBareMetal2ChassisOfferingAction.Result res = action.call();
```

Python SDK

```
UpdateBareMetal2ChassisOfferingAction action = UpdateBareMetal2ChassisOfferingAction()
action.uuid = "530ce92eb98a345ba74cc0f7fae932aa"
action.name = "new-offering-name"
action.description = "new-offering-description"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateBareMetal2ChassisOfferingAction.Result res = action.call()
```

5.7.25 QueryBareMetal2ChassisOffering

API Request

URLs

```
GET zstack/v1/baremetal2/chassis/offerings
```

```
GET zstack/v1/baremetal2/chassis/offerings/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid

SDK Sample

Java SDK

```
QueryBareMetal2ChassisOfferingAction action = new QueryBareMetal2ChassisOfferingAction();
action.conditions = asList("uuid=34a1289f0165376aae6782a7c37460b3");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryBareMetal2ChassisOfferingAction.Result res = action.call();
```

Python SDK

```
QueryBareMetal2ChassisOfferingAction action = QueryBareMetal2ChassisOfferingAction()
action.conditions = ["uuid=38acdcf9fd6339bcb04a94ef9bc5b95c"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryBareMetal2ChassisOfferingAction.Result res = action.call()
```

5.7.26 ChangeBareMetal2ChassisOfferingState

API Request

URLs

```
PUT zstack/v1/baremetal2/chassis/offerings/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeBareMetal2ChassisOfferingState": {
    "stateEvent": "enable"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X PUT -d '{"changeBareMetal2ChassisOfferingState":
{"stateEvent":"enable"}}' http://localhost:8080/zstack/v1/baremetal2/
chassis/offerings/bb6d3f5ef72d3051aaff974b442a0cbf/actions
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
uuid	String	url	The chassis offering UUID.		4.0.0
stateEvent	String	body(contained in the changeBareMetal2ChassisOfferingState structure)	The event that changes the state of the chassis offering.	- enable - disable	4.0.0
systemTags	List	body	Optional. The system tags.		4.0.0
userTags	List	body	Optional. The user tags.		4.0.0

API Response

Sample Response

SDK Sample

Java SDK

```
AddBareMetal2GatewayAction action = new AddBareMetal2GatewayAction();
action.username = "userName";
action.password = "password";
```

```

action.sshPort = 22.0;
action.name = "gateway";
action.managementIp = "127.0.0.1";
action.clusterUuid = "5b08798053343ec686244dc3a36bbccf";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
AddBareMetal2GatewayAction.Result res = action.call();

```

Python SDK

```

AddBareMetal2GatewayAction action = AddBareMetal2GatewayAction()
action.username = "userName"
action.password = "password"
action.sshPort = 22.0
action.name = "gateway"
action.managementIp = "127.0.0.1"
action.clusterUuid = "5b08798053343ec686244dc3a36bbccf"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
AddBareMetal2GatewayAction.Result res = action.call()

```

5.7.28 DeleteBareMetal2Gateway

API Request

URLs

```
DELETE zstack/v1/baremetal2/gateways/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/baremetal2/gateways/
f34f2a3179ae362eb5c01ae22581d2ac

```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
uuid	String	url	The UUID of the gateway.		4.0.0
deleteMode	String	body	Optional. The deletion mode.	- Permissive - Enforcing	4.0.0
systemTags	List	body	Optional. The system tags.		4.0.0

Name	Type	Location	Description	Valid Value	Starting Version
userTags	List	body	Optional. The user tags.		4.0.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteBareMetal2GatewayAction action = new DeleteBareMetal2GatewayAction();
action.uuid = "f34f2a3179ae362eb5c01ae22581d2ac";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteBareMetal2GatewayAction.Result res = action.call();
```

Python SDK

```
DeleteBareMetal2GatewayAction action = DeleteBareMetal2GatewayAction()
action.uuid = "f34f2a3179ae362eb5c01ae22581d2ac"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
DeleteBareMetal2GatewayAction.Result res = action.call()
```

5.7.29 UpdateBareMetal2Gateway

API Request

URLs

```
PUT zstack/v1/baremetal2/gateways/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateBareMetal2Gateway": {
    "sshPort": 22.0,
    "password": "password",
    "name": "NEW_BM_GATEWAY",
    "description": "This is a new bare metal gateway.",
    "managementIp": "192.168.0.10"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateBareMetal2Gateway":

action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateBareMetal2GatewayAction.Result res = action.call();
```

Python SDK

```
UpdateBareMetal2GatewayAction action = UpdateBareMetal2GatewayAction()
action.sshPort = 22.0
action.password = "password"
action.uuid = "bb000d56b8143341a57a76b7344b9b65"
action.name = "NEW_BM_GATEWAY"
action.description = "This is a new bare metal gateway."
action.managementIp = "192.168.0.10"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateBareMetal2GatewayAction.Result res = action.call()
```

5.7.30 QueryBareMetal2Gateway

API Request

URLs

```
GET zstack/v1/baremetal2/gateways
```

```
GET zstack/v1/baremetal2/gateways/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/baremetal2/gateways/48735292c5113181bcc27dddbfc123fd
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/baremetal2/gateways?q=uuid=317ac820ec8b35d4acf701b7333a4fcc
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryBareMetal2Gateway`, and pressing the **Tab** key.

SDK Sample

Java SDK

```
QueryBareMetal2GatewayAction action = new QueryBareMetal2GatewayAction();
action.conditions = asList("uuid=089cc9f73e31367c8d3db89f736957b2");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryBareMetal2GatewayAction.Result res = action.call();
```

Python SDK

```
QueryBareMetal2GatewayAction action = QueryBareMetal2GatewayAction()
action.conditions = ["uuid=88779d1fce2138c28744a2ed1265df1d"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryBareMetal2GatewayAction.Result res = action.call()
```

5.7.31 ChangeBareMetal2GatewayState

API Request

URLs

```
PUT zstack/v1/baremetal2/gateways/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeBareMetal2GatewayState": {
    "stateEvent": "enable"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json; charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"changeBareMetal2GatewayState":{"stateEvent":"enable"}}'
http://localhost:8080/zstack/v1/baremetal2/
gateways/45e9cf4edc7638eaad0ef5e2ca03a911/actions
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
uuid	String	url	The UUID of the gateway.		4.0.0
stateEvent	String	body(contained in the changeBareMetal2GatewayState structure)	The event that changes the state of the chassis.	- enable - disable	4.0.0
systemTags	List	body	Optional. The system tags.		4.0.0
userTags	List	body	Optional. The user tags.		4.0.0

API Response

Sample Response

```
{
  "inventory": {
    "username": "username",
    "password": "password",
    "sshPort": 22.0,
    "zoneUuid": "f7ee69031623443a82c3d1ad14e17216",

SDK Sample

Java SDK

```
ReconnectBareMetal2GatewayAction action = new ReconnectBareMetal2GatewayAction();
action.uuid = "42194e64d56e3e0cb3d6343429ac9fc1";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
ReconnectBareMetal2GatewayAction.Result res = action.call();
```

Python SDK

```
ReconnectBareMetal2GatewayAction action = ReconnectBareMetal2GatewayAction()
action.uuid = "42194e64d56e3e0cb3d6343429ac9fc1"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
ReconnectBareMetal2GatewayAction.Result res = action.call()
```

5.7.33 GetBareMetal2GatewayAllocatorStrategies

API Request

URLs

```
GET zstack/v1/baremetal2/gateways/allocators/strategies
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/baremetal2/gateways/allocators/strategies
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
systemTags	List	query	Optional. The system tags.		4.0.0

Name	Type	Location	Description	Valid Value	Starting Version
userTags	List	query	Optional. The user tags.		4.0.0

API Response

Sample Response

```
{
  "gatewayAllocatorStrategies": [
    "DefaultGatewayAllocatorStrategy",
    "LastGatewayPreferredAllocatorStrategy",
    "LeastBmPreferredGatewayAllocatorStrategy"
  ]
}
```

Name	Type	Description	Starting Version
strategies	List	The polices of allocating gateways for bare metal instances.	4.0.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.0.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	4.0.0
description	String	The brief description of the error.	4.0.0
details	String	The details about the error.	4.0.0
elaboration	String	The reserved field. Default value: null.	4.0.0

Name	Type	Description	Starting Version
opaque	LinkedHashMap	The reserved field. Default value: null.	4.0.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.0.0

SDK Sample

Java SDK

```
GetBareMetal2GatewayAllocatorStrategiesAction action = new GetBareMetal2GatewayAllocatorStrategiesAction();
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetBareMetal2GatewayAllocatorStrategiesAction.Result res = action.call();
```

Python SDK

```
GetBareMetal2GatewayAllocatorStrategiesAction action = GetBareMetal2GatewayAllocatorStrategiesAction()
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetBareMetal2GatewayAllocatorStrategiesAction.Result res = action.call()
```

5.7.34 AttachBareMetal2GatewayToCluster

API Request

URLs

```
POST zstack/v1/baremetal2/clusters/{clusterUuid}/gateways/{gatewayUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {},
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \

createDate	Timestamp	The time when the NIC was created.	4.0.0
lastOpDate	Timestamp	The time when the NIC was last modified.	4.0.0
usedIps	List	See usedIps .	4.0.0

#usedIps

Name	Type	Description	Starting Version
uuid	String	The UUID of the IP address.	4.0.0
ipRangeUuid	String	The IP range UUID.	4.0.0
l3NetworkUuid	String	The L3 network UUID.	4.0.0

Name	Type	Description	Starting Version
ipVersion	Integer	The IP version.	4.0.0
ip	String	The IP address.	4.0.0
netmask	String	The netmask of the IP address.	4.0.0
gateway	String	The gateway IP address.	4.0.0
usedFor	String		4.0.0
ipInLong	long		4.0.0
vmNicUuid	String	The NIC UUID.	4.0.0
createDate	Timestamp	The time when the IP address was created.	4.0.0
lastOpDate	Timestamp	The time when the IP address was last modified.	4.0.0

#allVolumes

Name	Type	Description	Starting Version
uuid	String	The volume UUID.	4.0.0
name	String	The volume name.	4.0.0
description	String	The detailed description of the volume.	4.0.0
primaryStorageUuid	String	The primary storage UUID.	4.0.0
vmInstanceUuid	String	The VM instance UUID.	4.0.0
diskOfferingUuid	String	The volume offering UUID.	4.0.0
rootImageUuid	String	The root image UUID.	4.0.0
installPath	String	The installation path of the volume in the primary storage.	4.0.0
type	String	The type of the volume.	4.0.0

Name	Type	Description	Starting Version
format	String	The format of the volume.	4.0.0
size	Long	The size of the volume.	4.0.0
actualSize	Long	The actual storage space that the volume takes up.	4.0.0
deviceId	Integer		4.0.0
state	String	The state of the volume.	4.0.0
status	String	The status of the volume.	4.0.0
createDate	Timestamp	The time when the volume was created.	4.0.0
lastOpDate	Timestamp	The time when the volume was last modified.	4.0.0
isShareable	Boolean	Indicates whether the volume is shareable.	4.0.0
volumeQos	String	The QoS of the volume, for example, 1048576.	4.0.0

- When you create an elastic baremetal instance from a local disk (non take-over) baremetal node on ZStack Cloud, , you can specify a disk to write system data by adding the **systemDisk** option to **SystemTags**.
 - Format: `systemDisk::WWN`
 - Example: `systemDisk::0x5000c500d490b3d0`

SDK Sample

Java SDK

```
CreateBareMetal2IpmiChassisHardwareInfoAction action = new CreateBareMetal2IpmiChassisHardwareInfoAction();
action.ipmiAddress = "192.168.0.10";
action.ipmiPort = 623.0;
action.hardwareInfo = "{ 'architecture': 'x86_64', 'cpuModelName': 'Intel i7-6700K', 'cpuNum': '8', 'memorySize': '33421254656', 'nics': [{ 'nicMac
```

```
'::40:8d:5c:f7:8d:61', 'nicSpeed':'1000Mbps', 'isProvisionNic':'true
'}]]}";
CreateBareMetal2IpmiChassisHardwareInfoAction.Result res = action.call
();
```

Python SDK

```
CreateBareMetal2IpmiChassisHardwareInfoAction action = CreateBare
Metal2IpmiChassisHardwareInfoAction()
action.ipmiAddress = "192.168.0.10"
action.ipmiPort = 623.0
action.hardwareInfo = "{ 'architecture':'x86_64', 'cpuModelName':'Intel
i7-6700K', 'cpuNum':'8', 'memorySize':'33421254656', 'nics':[{ 'nicMac
':'40:8d:5c:f7:8d:61', 'nicSpeed':'1000Mbps', 'isProvisionNic':'true
'}]]}"
CreateBareMetal2IpmiChassisHardwareInfoAction.Result res = action.call
()
```

5.7.38 UpdateBareMetal2Instance

API Request

URLs

```
PUT /v1/baremetal2/bm-instances/{uuid}/action
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateBareMetal2Instance": {
    "name": "new-bm2-instance-name",
    "description": "new-bm2-instance-description",
    "state": "Running",
    "chassisOfferingUuid": "75f357e1c7d931f8977c44cf6e472088",
    "defaultL3NetworkUuid": "93b3ad570c9238568da83b838e41b944",
    "autoReleaseChassisEvent": "enable"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X PUT -d '{"updateBareMetal2Instance":{"name":"new-bm2-instance-name","description":"new-bm2-instance-description","state":"Running","chassisOfferingUuid":"75f357e1c7d931f8977c44cf6e4http://localhost:8080/zstack/v1/baremetal2/bm-instances/fe3ee28c03793c57b64c5cc76e096566/action'}
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
uuid	String	url	The bare metal instance UUID.		4.0.0
name	String	body(contained in the updateBareMetal2Instance structure)	Optional. The bare metal instance name.		4.0.0
description	String	body(contained in the updateBareMetal2Instance structure)	Optional. The detailed description of the bare metal instance.		4.0.0
state		body(contained in the updateBareMetal2Instance structure)	Optional. The running state of the bare metal instance.	- Stopped - Running	
chassisOfferingUuid	String	body(contained in the updateBareMetal2Instance structure)	Optional. The chassis offering UUID.		4.0.0
defaultL3NetworkUuid	String	body(contained in the updateBareMetal2Instance structure)	Optional. The default L3 network UUID.		4.0.0

Name	Type	Location	Description	Valid Value	Starting Version
		ance structure)			
autoReleaseChassisEvent	String	body(contained in the updateBareMetal2Instance structure)	Optional. Specifies whether to enable auto-release of the bare metal chassis if the bare metal instance is powered off.	- enable - disable	4.0.0
systemTags	List	body	Optional. The system tags.		4.0.0
userTags	List	body	Optional. The user tags.		4.0.0

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.0.0
inventory	BareMetal2InstanceInventory	See inventory .	4.0.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.0.0
description	String	The brief description of the error.	4.0.0
details	String	The details about the error.	4.0.0
elaboration	String	The reserved field. Default value: null.	4.0.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.0.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.0.0

#inventory

Name	Type	Description	Starting Version
chassisUuid	String	The UUID of the bare metal chassis.	4.0.0

Name	Type	Description	Starting Version
lastChassisUuid	String	The UUID of the bare metal chassis where the instance last resides.	4.0.0
gatewayUuid	String	The gateway UUID.	4.0.0
lastGatewayUuid	String	The UUID of the last gateway.	4.0.0
chassisOfferingUuid	String	The chassis offering UUID.	4.0.0
gatewayAllocatorStrategy	String	The gateway allocation policy.	4.0.0
status	String	The connection status of the bare metal instance.	4.0.0
uuid	String	The UUID of the bare metal instance.	4.0.0
name	String	The bare metal instance name.	4.0.0
description	String	The detailed description of the bare metal instance.	4.0.0
zoneUuid	String	The zone UUID.	4.0.0
clusterUuid	String	The cluster UUID.	4.0.0
imageUuid	String	The image UUID.	4.0.0
rootVolumeUuid	String	The root volume UUID	4.0.0
platform	String	The platform type.	4.0.0
defaultL3NetworkUuid	String	The UUID of the default L3 network.	4.0.0
type	String	The type of the bare metal instance.	4.0.0
hypervisorType	String	The virtualization type.	4.0.0
memorySize	Long	The memory size.	4.0.0
cpuNum	Integer	The number of CPU cores.	4.0.0

Name	Type	Description	Starting Version
cpuSpeed	Long	The processing speed of the CPU.	4.0.0
createDate	Timestamp	The time when the bare metal instance was created.	4.0.0
lastOpDate	Timestamp	The time when the bare metal instance was last modified.	4.0.0
state	String	The state of the bare metal instance.	4.0.0
provisionNic	BareMetal2InstanceProvisionNicInventory	See provisionNic .	4.0.0
vmNics	List	See vmNics .	4.0.0
allVolumes	List	See allVolumes .	4.0.0

#provisionNic

Name	Type	Description	Starting Version
uuid	String	The UUID of the NIC that is in the deployment network.	4.0.0
networkUuid	String	The deployment network UUID.	4.0.0
mac	String	The name of the NIC.	4.0.0
ip	String	The IP address of the NIC.	4.0.0
netmask	String	The netmask of the NIC.	4.0.0
gateway	String	The gateway IP address.	4.0.0
metadata	String		4.0.0
createDate	Timestamp	The time when the NIC was created.	4.0.0
lastOpDate	Timestamp	The time when the NIC was last modified.	4.0.0

#vmNics

Name	Type	Description	Starting Version
uuid	String	The UUID of the NIC of the bare metal instance.	4.0.0
vmInstanceUuid	String	The UUID of the VM instance.	4.0.0
l3NetworkUuid	String	The L3 network UUID.	4.0.0
ip	String	The IP address of the NIC.	4.0.0
mac	String	The MAC address of the NIC.	4.0.0
hypervisorType	String	The virtualization type.	4.0.0
netmask	String	The netmask of the NIC.	4.0.0
gateway	String	The gateway IP address.	4.0.0
metaData	String		4.0.0
ipVersion	Integer	The version of the IP address.	4.0.0
deviceId	Integer	The device ID.	4.0.0
type	String	The NIC type.	4.0.0
createDate	Timestamp	The time when the NIC was created.	4.0.0
lastOpDate	Timestamp	The time when the NIC was last modified.	4.0.0
usedIps	List	See usedIps .	4.0.0

#usedIps

Name	Type	Description	Starting Version
uuid	String	The UUID of the IP address.	4.0.0
ipRangeUuid	String	The IP range UUID.	4.0.0
l3NetworkUuid	String	The L3 network UUID.	4.0.0

Name	Type	Description	Starting Version
ipVersion	Integer	The IP version.	4.0.0
ip	String	The IP address.	4.0.0
netmask	String	The netmask of the IP address.	4.0.0
gateway	String	The gateway IP address.	4.0.0
usedFor	String		4.0.0
ipInLong	long		4.0.0
vmNicUuid	String	The NIC UUID.	4.0.0
createDate	Timestamp	The time when the IP address was created.	4.0.0
lastOpDate	Timestamp	The time when the IP address was last modified.	4.0.0

#allVolumes

Name	Type	Description	Starting Version
uuid	String	The volume UUID.	4.0.0
name	String	The volume name.	4.0.0
description	String	The detailed description of the volume.	4.0.0
primaryStorageUuid	String	The primary storage UUID.	4.0.0
vmInstanceUuid	String	The VM instance UUID.	4.0.0
diskOfferingUuid	String	The volume offering UUID.	4.0.0
rootImageUuid	String	The root image UUID.	4.0.0
installPath	String	The installation path of the volume in the primary storage.	4.0.0
type	String	The type of the volume.	4.0.0

Name	Type	Description	Starting Version
format	String	The format of the volume.	4.0.0
size	Long	The size of the volume.	4.0.0
actualSize	Long	The actual storage space that the volume takes up.	4.0.0
deviceId	Integer		4.0.0
state	String	The state of the volume.	4.0.0
status	String	The status of the volume.	4.0.0
createDate	Timestamp	The time when the volume was created.	4.0.0
lastOpDate	Timestamp	The time when the volume was last modified.	4.0.0
isShareable	Boolean	Indicates whether the volume is shareable.	4.0.0
volumeQos	String	The QoS of the volume, for example, 1048576.	4.0.0

```

Python SDK

```
QueryBareMetal2GatewayAction action = QueryBareMetal2GatewayAction()
action.conditions = ["uuid=88779d1fce2138c28744a2ed1265df1d"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryBareMetal2GatewayAction.Result res = action.call()
```

5.7.40 ChangeBareMetal2InstancePassword

API Request

URLs

```
PUT /v1/baremetal2/bm-instances/{uuid}/action
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeBareMetal2InstancePassword": {
    "username": "root",
    "password": "password"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"changeBareMetal2InstancePassword":
{"username":"root","password":"password"}}' http://
localhost:8080/zstack/v1/baremetal2/bm-instances/
f2c1f0101aef32c782ddd6a09899d296/action
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
uuid	String	url	The UUID of the bare metal instance.		4.0.0
username	String	body(contained in the changeBareMetal2InstancePassword structure)	The username.		4.0.0
password	String	body(contained in the changeBareMetal2InstancePassword structure)	The password.		4.0.0
systemTags	List	body	Optional. The system tags.		4.0.0
userTags	List	body	Optional. The user tags.		4.0.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "inventory": {
    "chassisUuid": "1c06589d9b39475d8da1488cedad433b",
    "lastChassisUuid": "381c287319f040d6bfda27f2e873c495",
```

```

"gatewayUuid": "ee6e344efcac481f9fb135c83868f2a0",
"lastGatewayUuid": "77f3d8f675ae4fc1b52ddb35e64743ef",
"chassisOfferingUuid": "0799c5e4b9db480abf0072a74af99cbc",
"status": "Connected",
"uuid": "f615bc219c264801ae2d183071b55b44",
"name": "BM-1",
"description": "This is a BareMetal2 Instance.",
"zoneUuid": "f67ee2185540426495b410a3c8ea2ba9",
"clusterUuid": "146f701449f8455f9d0ab375c86c1de4",
"imageUuid": "9d8169d053c84ef5bee8f68225c95983",
"rootVolumeUuid": "794df7c17cbf451eaa86ad3124a0f577",
"platform": "Linux",
"type": "baremetal2",
"memorySize": 8.589934592E9,
"cpuNum": 8.0,
"createDate": "Nov 14, 2017 10:20:57 PM",
"lastOpDate": "Nov 14, 2017 10:20:57 PM",
"state": "Running"
}
}

```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.0.0
inventory	BareMetal2InstanceInventory	See inventory .	4.0.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.0.0
description	String	The brief description of the error.	4.0.0
details	String	The details about the error.	4.0.0
elaboration	String	The reserved field. Default value: null.	4.0.0

Name	Type	Description	Starting Version
opaque	LinkedHashMap	The reserved field. Default value: null.	4.0.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.0.0

#inventory

Name	Type	Description	Starting Version
chassisUuid	String	The UUID of the bare metal chassis.	4.0.0
lastChassisUuid	String	The UUID of the bare metal chassis where the instance last resides.	4.0.0
gatewayUuid	String	The gateway UUID.	4.0.0
lastGatewayUuid	String	The UUID of the last gateway.	4.0.0
chassisOfferingUuid	String	The chassis offering UUID.	4.0.0
gatewayAllocatorStrategy	String	The gateway allocation policy.	4.0.0
status	String	The connection status of the bare metal instance.	4.0.0
uuid	String	The UUID of the bare metal instance.	4.0.0
name	String	The bare metal instance name.	4.0.0
description	String	The detailed description of the bare metal instance.	4.0.0
zoneUuid	String	The zone UUID.	4.0.0

Name	Type	Description	Starting Version
clusterUuid	String	The cluster UUID.	4.0.0
imageUuid	String	The image UUID.	4.0.0
rootVolumeUuid	String	The root volume UUID.	4.0.0
platform	String	The platform type.	4.0.0
defaultL3NetworkUuid	String	The UUID of the default L3 network.	4.0.0
type	String	The type of the bare metal instance.	4.0.0
hypervisorType	String	The virtualization type.	4.0.0
memorySize	Long	The memory size.	4.0.0
cpuNum	Integer	The number of CPU cores.	4.0.0
cpuSpeed	Long	The processing speed of the CPU.	4.0.0
createDate	Timestamp	The time when the bare metal instance was created.	4.0.0
lastOpDate	Timestamp	The time when the bare metal instance was last modified.	4.0.0
state	String	The state of the bare metal instance.	4.0.0
provisionNic	BareMetal2InstanceProvisionNicInventory	See provisionNic .	4.0.0
vmNics	List	See vmNics .	4.0.0
allVolumes	List	See allVolumes .	4.0.0

#provisionNic

Name	Type	Description	Starting Version
uuid	String	The UUID of the NIC that is in the deployment network.	4.0.0

Name	Type	Description	Starting Version
networkUuid	String	The deployment network UUID.	4.0.0
mac	String	The name of the NIC.	4.0.0
ip	String	The IP address of the NIC.	4.0.0
netmask	String	The netmask of the NIC.	4.0.0
gateway	String	The gateway IP address.	4.0.0
metadata	String		4.0.0
createDate	Timestamp	The time when the NIC was created.	4.0.0
lastOpDate	Timestamp	The time when the NIC was last modified.	4.0.0

#vmNics

Name	Type	Description	Starting Version
uuid	String	The UUID of the NIC of the bare metal instance.	4.0.0
vmInstanceUuid	String	The UUID of the VM instance.	4.0.0
l3NetworkUuid	String	The L3 network UUID.	4.0.0
ip	String	The IP address of the NIC.	4.0.0
mac	String	The MAC address of the NIC.	4.0.0
hypervisorType	String	The virtualization type.	4.0.0
netmask	String	The netmask of the NIC.	4.0.0
gateway	String	The gateway IP address.	4.0.0
metaData	String		4.0.0

Name	Type	Description	Starting Version
ipVersion	Integer	The version of the IP address.	4.0.0
deviceId	Integer	The device ID.	4.0.0
type	String	The NIC type.	4.0.0
createDate	Timestamp	The time when the NIC was created.	4.0.0
lastOpDate	Timestamp	The time when the NIC was last modified.	4.0.0
usedIps	List	See usedIps .	4.0.0

#usedIps

Name	Type	Description	Starting Version
uuid	String	The UUID of the IP address.	4.0.0
ipRangeUuid	String	The IP range UUID.	4.0.0
l3NetworkUuid	String	The L3 network UUID.	4.0.0
ipVersion	Integer	The IP version.	4.0.0
ip	String	The IP address.	4.0.0
netmask	String	The netmask of the IP address.	4.0.0
gateway	String	The gateway IP address.	4.0.0
usedFor	String		4.0.0
ipInLong	long		4.0.0
vmNicUuid	String	The NIC UUID.	4.0.0
createDate	Timestamp	The time when the IP address was created.	4.0.0
lastOpDate	Timestamp	The time when the IP address was last modified.	4.0.0

#allVolumes

Name	Type	Description	Starting Version
uuid	String	The volume UUID.	4.0.0
name	String	The volume name.	4.0.0
description	String	The detailed description of the volume.	4.0.0
primaryStorageUuid	String	The primary storage UUID.	4.0.0
vmInstanceUuid	String	The VM instance UUID.	4.0.0
diskOfferingUuid	String	The volume offering UUID.	4.0.0
rootImageUuid	String	The root image UUID.	4.0.0
installPath	String	The installation path of the volume in the primary storage.	4.0.0
type	String	The type of the volume.	4.0.0
format	String	The format of the volume.	4.0.0
size	Long	The size of the volume.	4.0.0
actualSize	Long	The actual storage space that the volume takes up.	4.0.0
deviceId	Integer		4.0.0
state	String	The state of the volume.	4.0.0
status	String	The status of the volume.	4.0.0
createDate	Timestamp	The time when the volume was created.	4.0.0
lastOpDate	Timestamp	The time when the volume was last modified.	4.0.0

Name	Type	Description	Starting Version
isShareable	Boolean	Indicates whether the volume is shareable.	4.0.0
volumeQos	String	The QoS of the volume, for example, 1048576.	4.0.0

SDK Sample

Java SDK

```
ChangeBareMetal2InstancePasswordAction action = new ChangeBareMetal2InstancePasswordAction();
action.uuid = "f2c1f0101aef32c782ddd6a09899d296";
action.username = "root";
action.password = "password";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
ChangeBareMetal2InstancePasswordAction.Result res = action.call();
```

Python SDK

```
ChangeBareMetal2InstancePasswordAction action = ChangeBareMetal2InstancePasswordAction()
action.uuid = "f2c1f0101aef32c782ddd6a09899d296"
action.username = "root"
action.password = "password"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
ChangeBareMetal2InstancePasswordAction.Result res = action.call()
```

5.7.41 StartBareMetal2Instance

API Request

URLs

```
PUT zstack/v1/baremetal2/bm-instances/{uuid}/action
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "startBareMetal2Instance": {

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.0.0
description	String	The brief description of the error.	4.0.0

Name	Type	Description	Starting Version
details	String	The details about the error.	4.0.0
elaboration	String	The reserved field. Default value: null.	4.0.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.0.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.0.0

#inventory

Name	Type	Description	Starting Version
chassisUuid	String	The UUID of the bare metal chassis.	4.0.0
lastChassisUuid	String	The UUID of the bare metal chassis where the instance last resides.	4.0.0
gatewayUuid	String	The gateway UUID.	4.0.0
lastGatewayUuid	String	The UUID of the last gateway.	4.0.0
chassisOfferingUuid	String	The chassis offering UUID.	4.0.0
gatewayAllocatorStrategy	String	The gateway allocation policy.	4.0.0
status	String	The connection status of the bare metal instance.	4.0.0
uuid	String	The UUID of the bare metal instance.	4.0.0
name	String	The bare metal instance name.	4.0.0

Name	Type	Description	Starting Version
description	String	The detailed description of the bare metal instance.	4.0.0
zoneUuid	String	The zone UUID.	4.0.0
clusterUuid	String	The cluster UUID.	4.0.0
imageUuid	String	The image UUID.	4.0.0
rootVolumeUuid	String	The root volume UUID.	4.0.0
platform	String	The platform type.	4.0.0
defaultL3NetworkUuid	String	The UUID of the default L3 network.	4.0.0
type	String	The type of the bare metal instance.	4.0.0
hypervisorType	String	The virtualization type.	4.0.0
memorySize	Long	The memory size.	4.0.0
cpuNum	Integer	The number of CPU cores.	4.0.0
cpuSpeed	Long	The processing speed of the CPU.	4.0.0
createDate	Timestamp	The time when the bare metal instance was created.	4.0.0
lastOpDate	Timestamp	The time when the bare metal instance was last modified.	4.0.0
state	String	The state of the bare metal instance.	4.0.0
provisionNic	BareMetal2InstanceProvisionNicInventory	See provisionNic .	4.0.0
vmNics	List	See vmNics .	4.0.0
allVolumes	List	See allVolumes .	4.0.0

#provisionNic

Name	Type	Description	Starting Version
uuid	String	The UUID of the NIC that is in the deployment network.	4.0.0
networkUuid	String	The deployment network UUID.	4.0.0
mac	String	The name of the NIC.	4.0.0
ip	String	The IP address of the NIC.	4.0.0
netmask	String	The netmask of the NIC.	4.0.0
gateway	String	The gateway IP address.	4.0.0
metadata	String		4.0.0
createDate	Timestamp	The time when the NIC was created.	4.0.0
lastOpDate	Timestamp	The time when the NIC was last modified.	4.0.0

#vmNics

Name	Type	Description	Starting Version
uuid	String	The UUID of the NIC of the bare metal instance.	4.0.0
vmInstanceUuid	String	The UUID of the VM instance.	4.0.0
l3NetworkUuid	String	The L3 network UUID.	4.0.0
ip	String	The IP address of the NIC.	4.0.0
mac	String	The MAC address of the NIC.	4.0.0
hypervisorType	String	The virtualization type.	4.0.0
netmask	String	The netmask of the NIC.	4.0.0

Name	Type	Description	Starting Version
gateway	String	The gateway IP address.	4.0.0
metaData	String		4.0.0
ipVersion	Integer	The version of the IP address.	4.0.0
deviceId	Integer	The device ID.	4.0.0
type	String	The NIC type.	4.0.0
createDate	Timestamp	The time when the NIC was created.	4.0.0
lastOpDate	Timestamp	The time when the NIC was last modified.	4.0.0
usedIps	List	See usedIps .	4.0.0

#usedIps

Name	Type	Description	Starting Version
uuid	String	The UUID of the IP address.	4.0.0
ipRangeUuid	String	The IP range UUID.	4.0.0
l3NetworkUuid	String	The L3 network UUID.	4.0.0
ipVersion	Integer	The IP version.	4.0.0
ip	String	The IP address.	4.0.0
netmask	String	The netmask of the IP address.	4.0.0
gateway	String	The gateway IP address.	4.0.0
usedFor	String		4.0.0
ipInLong	long		4.0.0
vmNicUuid	String	The NIC UUID.	4.0.0
createDate	Timestamp	The time when the IP address was created.	4.0.0

Name	Type	Description	Starting Version
lastOpDate	Timestamp	The time when the IP address was last modified.	4.0.0

#allVolumes

Name	Type	Description	Starting Version
uuid	String	The volume UUID.	4.0.0
name	String	The volume name.	4.0.0
description	String	The detailed description of the volume.	4.0.0
primaryStorageUuid	String	The primary storage UUID.	4.0.0
vmInstanceUuid	String	The VM instance UUID.	4.0.0
diskOfferingUuid	String	The volume offering UUID.	4.0.0
rootImageUuid	String	The root image UUID.	4.0.0
installPath	String	The installation path of the volume in the primary storage.	4.0.0
type	String	The type of the volume.	4.0.0
format	String	The format of the volume.	4.0.0
size	Long	The size of the volume.	4.0.0
actualSize	Long	The actual storage space that the volume takes up.	4.0.0
deviceId	Integer		4.0.0
state	String	The state of the volume.	4.0.0
status	String	The status of the volume.	4.0.0

Name	Type	Description	Starting Version
createDate	Timestamp	The time when the volume was created.	4.0.0
lastOpDate	Timestamp	The time when the volume was last modified.	4.0.0
isShareable	Boolean	Indicates whether the volume is shareable.	4.0.0
volumeQos	String	The QoS of the volume, for example, 1048576.	4.0.0

SDK Sample

Java SDK

```
ReconnectBareMetal2InstanceAction action = new ReconnectBareMetal2InstanceAction();
action.uuid = "a84e99583ee53cfda312c5dc578e8f26";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
ReconnectBareMetal2InstanceAction.Result res = action.call();
```

Python SDK

```
ReconnectBareMetal2InstanceAction action = ReconnectBareMetal2InstanceAction()
action.uuid = "a84e99583ee53cfda312c5dc578e8f26"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
ReconnectBareMetal2InstanceAction.Result res = action.call()
```

5.7.43 CheckStaticProvisionIp

API Request

URLs

```
POST zstack/v1/baremetal2/bm-instances/static/provision/ip/check
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "clusterUuid": "25f9e4033cc13338b813cc239347843b",
    "provisionIp": "10.99.0.3"
  }
}
```

```

    },
    "systemTags": [],
    "userTags": []
  }

```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"clusterUuid":"25f9e4033cc13338b813cc239347843b","provisionIp":"10.99.0.3"}}'
http://localhost:8080/zstack/v1/baremetal2/bm-instances/static/
provision/ip/check

```

Request Parameters

Name	Type	Location	Description	Valid Values	Starting Version
clusterUuid	String	body (contained in the params structure)	The cluster UUID.		5.2.0
provisionIp	String	body (contained in the params structure)	The provision IP address.		5.2.0
systemTags	List	body	Optional. The system tags.		5.2.0
userTags	List	body	Optional. The user tags.		5.2.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```

{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}

```

```
}
```

SDK Sample

Java SDK

```
CheckStaticProvisionIpAction action = new CheckStaticProvisionIpAction
();
action.clusterUuid = "25f9e4033cc13338b813cc239347843b";
action.provisionIp = "10.99.0.3";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CheckStaticProvisionIpAction.Result res = action.call();
```

Python SDK

```
CheckStaticProvisionIpAction action = CheckStaticProvisionIpAction()
action.clusterUuid = "25f9e4033cc13338b813cc239347843b"
action.provisionIp = "10.99.0.3"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CheckStaticProvisionIpAction.Result res = action.call()
```

5.7.44 InspectBareMetal2ChassisByInstance

API Request

URLs

```
PUT zstack/v1/baremetal2/bm-instances/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "inspectBareMetal2ChassisByInstance": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X PUT -d '{"inspectBareMetal2ChassisByInstance":{}}'
http://localhost:8080/zstack/v1/baremetal2/bm-instances/
d40144a84b1633e8b2aacd333a7105d3/actions
```

Request Parameters

Name	Type	Location	Description	Valid Values	Starting Version
uuid	String	url	The resource UUID.		5.2.0
systemTags	List	body	Optional. The system tags.		5.2.0
userTags	List	body	Optional. The user tags.		5.2.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "33ce10962f314b71be5b846cd7230af7",

Name	Type	Description	Starting Version
chassisUuid	String		4.4.24

Name	Type	Description	Starting Version
name	String	The resource name.	4.4.24
slaves	String		4.4.24
opts	String		4.4.24
mode	Integer		4.4.24
createDate	Timestamp	The creation date.	4.4.24
lastOpDate	Timestamp	The last operation date.	4.4.24
accountUuid	String	The account UUID.	4.4.24
uuid	String	The resource UUID.	4.4.24

SDK Sample

Java SDK

```
QueryBareMetal2BondingAction action = new QueryBareMetal2BondingAction();
action.conditions = asList("uuid=7a85935a77ff378bbd349f619f647b26");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryBareMetal2BondingAction.Result res = action.call();
```

Python SDK

```
QueryBareMetal2BondingAction action = QueryBareMetal2BondingAction()
action.conditions = ["uuid=cb72ba18b6f83cec99cbf2519694ad33"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryBareMetal2BondingAction.Result res = action.call()
```

5.7.48 QueryBareMetal2BondingNicRef

API Requests

URLs

```
GET /v1/baremetal2/bonding/nic/refs
```

Headers

```
Authorization: OAuth the-session-uuid
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryBareMetal2BondingNicRef**, and pressing the **Tab** key.

Curl Samples

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/baremetal2/bonding/nic/refs?
q=uuid=1ca709f9d1cf377b99b20f277e7c97f9
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error	4.4.24
success	boolean		4.4.24
inventories	List	See inventories	4.4.24

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.4.24

Name	Type	Description	Starting Version
description	String	The brief description of the error.	4.4.24
details	String	The details about the error.	4.4.24
elaboration	String	The reserved field. Default value: null.	4.4.24
opaque	LinkedHashMap	The reserved field. Default value: null.	4.4.24
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.4.24

#inventories

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	4.4.24
name	String	The resource name.	4.4.24
description	String	The detailed description of the resource.	4.4.24
zoneUuid	String	The zone UUID.	4.4.24
clusterUuid	String	The cluster UUID.	4.4.24
chassisOfferingUuid	String	The chassis offering UUID.	4.4.24
type	String	Type	4.4.24
state	String	The state of the elastic bare metal instance.	4.4.24
status	String	The status of the elastic bare metal instance.	4.4.24
powerStatus	String	The power status.	4.4.24
createDate	Timestamp	The creation date.	4.4.24

Name	Type	Description	Starting Version
lastOpDate	Timestamp	The last operation date.	4.4.24
chassisNics	List	See chassisNics	4.4.24
chassisDisks	List	See chassisDisks	4.4.24
chassisOffering	BareMetal2ChassisOfferingInventory	See chassisOffering	4.4.24

#chassisNics

Name	Type	Description	Starting Version
uuid	String	The UUID of the bare metal chassis NIC.	4.4.24
chassisUuid	String	The UUID of the bare metal chassis.	4.4.24
mac	String	The MAC address of the chassis NIC.	4.4.24
speed	String	The data rate of the chassis NIC.	4.4.24
isProvisionNic	Boolean	Indicates whether the NIC is a provisioned NIC.	4.4.24
createDate	Timestamp	The time when the NIC was created.	4.4.24
lastOpDate	Timestamp	The time when the NIC was last modified.	4.4.24

#chassisDisks

Name	Type	Description	Starting Version
uuid	String	The UUID of the chassis disk.	4.4.24
chassisUuid	String	The chassis UUID.	4.4.24
diskSize	Long	The size of the disk storage space, in bytes.	4.4.24
type	String	The type of the disk.	4.4.24

Name	Type	Description	Starting Version
createDate	Timestamp	The time when the disk was created.	4.4.24
lastOpDate	Timestamp	The time when the disk was last modified.	4.4.24

#chassisOffering

Name	Type	Description	Starting Version
uuid	String	The chassis offering UUID.	4.4.24
name	String	The name of the chassis offering.	4.4.24
description	String	The detailed description of the chassis offering.	4.4.24
architecture	String	The CPU architecture.	4.4.24
cpuModelName	String	The CPU model name.	4.4.24
cpuNum	Integer	The number of CPU cores.	4.4.24
memorySize	Long	The memory size.	4.4.24
bootMode	String	The boot mode.	4.4.24
state	String	The state of the chassis offering.	4.4.24
createDate	Timestamp	The time when the chassis offering was created.	4.4.24
lastOpDate	Timestamp	The time when the chassis offering was last modified.	4.4.24

SDK Sample

Java SDK

```
QueryBareMetal2BondingNicRefAction action = new QueryBareMetal2BondingNicRefAction();
action.conditions = asList("uuid=9c199dcc0a8e3f888e2e2979b9c68b5e");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
QueryBareMetal2BondingNicRefAction.Result res = action.call();
```

Python SDK

```
QueryBareMetal2BondingNicRefAction action = QueryBareMetal2Bondi
ngNicRefAction()
action.conditions = ["uuid=2dfe71bbf313315f825a52a17568fc71"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryBareMetal2BondingNicRefAction.Result res = action.call()
```

5.7.49 CreateBareMetal2ProvisionNetwork

API Request

URLs

```
POST zstack/v1/baremetal2/provision-networks
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "BM_PROVISION_NETWORK",
    "description": "This is a baremetal2 provision network.",
    "zoneUuid": "3391c3bf65fb34d0ae8ace100c28da77",
    "dhcpInterface": "eth0",
    "dhcpRangeStartIp": "192.168.0.100",
    "dhcpRangeEndIp": "192.168.0.200",
    "dhcpRangeNetmask": "255.255.255.0",
    "dhcpRangeGateway": "192.168.0.1"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"name":"BM_PROVISION_NETWORK","description":"This is a baremetal2
provision
```

```
network.", "zoneUuid": "3391c3bf65fb34d0ae8ace100c28da77", "dhcpInterface": "eth0",  
http://localhost:8080/zstack/v1/baremetal2/provision-networks
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
name	String	body(contained in the params structure)	The name of the deployment network.		4.0.0
description	String	body(contained in the params structure)	Optional. The detailed description of the deployment network.		4.0.0
zoneUuid	String	body(contained in the params structure)	The zone UUID.		4.0.0
dhcpInterface	String	body(contained in the params structure)	The name of the DHCP NIC.		4.0.0
dhcpRangeStartIp	String	body(contained in the params structure)	The starting IP address that DHCP assigns to a bare metal instance.		4.0.0
dhcpRangeEndIp	String	body(contained in the params structure)	The ending IP address that DHCP assigns to a bare metal instance.		4.0.0
dhcpRangeNetmask	String	body(contained in the params structure)	The netmask of the IP range from which the DHCP server assigns an IP address		4.0.0

Name	Type	Location	Description	Valid Value	Starting Version
			to a bare metal instance.		
dhcpRangeGateway	String	body(contained in the params structure)	Optional. The gateway IP address.		4.0.0
resourceUuid	String	body(contained in the params structure)	Optional. The deployment network UUID.		4.0.0
tagUuids	List	body(contained in the params structure)	Optional. The tag UUIDs.		4.0.0
systemTags	List	body	Optional. The system tags.		4.0.0
userTags	List	body	Optional. The user tags.		4.0.0

API Response

Sample Response

SDK Sample

Java SDK

```
CreateBareMetal2ProvisionNetworkAction action = new CreateBareMetal2ProvisionNetworkAction();
action.name = "BM_PROVISION_NETWORK";
action.description = "This is a baremetal2 provision network.";
```

```

action.zoneUuid = "3391c3bf65fb34d0ae8ace100c28da77";
action.dhcpInterface = "eth0";
action.dhcpRangeStartIp = "192.168.0.100";
action.dhcpRangeEndIp = "192.168.0.200";
action.dhcpRangeNetmask = "255.255.255.0";
action.dhcpRangeGateway = "192.168.0.1";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateBareMetal2ProvisionNetworkAction.Result res = action.call();

```

Python SDK

```

CreateBareMetal2ProvisionNetworkAction action = CreateBareMetal2ProvisionNetworkAction()
action.name = "BM_PROVISION_NETWORK"
action.description = "This is a baremetal2 provision network."
action.zoneUuid = "3391c3bf65fb34d0ae8ace100c28da77"
action.dhcpInterface = "eth0"
action.dhcpRangeStartIp = "192.168.0.100"
action.dhcpRangeEndIp = "192.168.0.200"
action.dhcpRangeNetmask = "255.255.255.0"
action.dhcpRangeGateway = "192.168.0.1"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CreateBareMetal2ProvisionNetworkAction.Result res = action.call()

```

5.7.50 DeleteBareMetal2ProvisionNetwork

API Request

URLs

```
DELETE zstack/v1/baremetal2/provision-networks/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/baremetal2/provision-networks/b3418be5bae83706b8864daa54f0a680

```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
uuid	String	url	The deployment network UUID.		4.0.0

Name	Type	Location	Description	Valid Value	Starting Version
deleteMode	String	body	Optional. The deletion mode.	• Permissive • Enforcing	4.0.0
systemTags	List	body	Optional. The system tags.		4.0.0
userTags	List	body	Optional. The user tags.		4.0.0

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteBareMetal2ProvisionNetworkAction action = new DeleteBare
Metal2ProvisionNetworkAction();
action.uuid = "b3418be5bae83706b8864daa54f0a680";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteBareMetal2ProvisionNetworkAction.Result res = action.call();
```

Python SDK

```
DeleteBareMetal2ProvisionNetworkAction action = DeleteBareMetal2Prov
isionNetworkAction()
action.uuid = "b3418be5bae83706b8864daa54f0a680"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
DeleteBareMetal2ProvisionNetworkAction.Result res = action.call()
```

5.7.51 UpdateBareMetal2ProvisionNetwork

API Request

URLs

```
PUT zstack/v1/baremetal2/provision-networks/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateBareMetal2ProvisionNetwork": {
    "name": "NEW_BM_PROVISION_NETWORK",
    "description": "This is a new bare metal provision network.",
    "dhcpInterface": "ens0",

SDK Sample

Java SDK

```
QueryBareMetal2ProvisionNetworkAction action = new QueryBareMetal2ProvisionNetworkAction();
action.conditions = asList("uuid=51b899bda0df3484be1c6bc1fbba68de");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryBareMetal2ProvisionNetworkAction.Result res = action.call();
```

Python SDK

```
QueryBareMetal2ProvisionNetworkAction action = QueryBareMetal2ProvisionNetworkAction()
action.conditions = ["uuid=07e9ed20cfc13057adee51036dc1687e"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryBareMetal2ProvisionNetworkAction.Result res = action.call()
```

5.7.53 ChangeBareMetal2ProvisionNetworkState

API Request

URLs

```
PUT zstack/v1/baremetal2/provision-networks/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeBareMetal2ProvisionNetworkState": {
```

```

    "stateEvent": "enable"
  },
  "systemTags": [],
  "userTags": []
}

```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edeb53ca0678c" \
-X PUT -d '{"changeBareMetal2ProvisionNetworkState":
{"stateEvent":"enable"}}' http://localhost:8080/zstack/v1/baremetal2/
provision-networks/9d2b61e0abba3dd5830fe13bde6fc935/actions

```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
uuid	String	url	The deployment network UUID.		4.0.0
stateEvent	String	body(contained in the changeBareMetal2ProvisionNetworkState structure)	The event that changes the state of the chassis.	- enable - disable	4.0.0
systemTags	List	body	Optional. The system tags.		4.0.0
userTags	List	body	Optional. The user tags.		4.0.0

API Response**Sample Response**

action.https = true;
action.domainName = "vsphere-local.net";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
AddVCenterAction.Result res = action.call();
```

Python SDK

```
AddVCenterAction action = AddVCenterAction()
action.username = "admin@vsphere-local.net"
action.password = "test-pass"
action.zoneUuid = "25b9e68b1cc43836a79f1a35e3108880"
action.name = "vc1"
action.https = true
action.domainName = "vsphere-local.net"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
AddVCenterAction.Result res = action.call()
```

5.8.1.2 QueryVCenter

API Request

URLs

```
GET zstack/v1/vcenters
```

```
GET zstack/v1/vcenters/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth e46c3ba50f324bcbabda6c40d11d1e33" \
-X GET http://localhost:8080/zstack/v1/vcenters?
q=uuid=7e580c2f8b6c4e31aff447c45c72c3bb
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth d0552ed3feb243a1b87fcff421388964" \
-X GET http://localhost:8080/zstack/v1/vcenters/
bb39998d05004cd9aa5bf816cc308ed1
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryVCenter`, and pressing the **Tab** key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "uuid": "b84429ea486d3e878afd4175bff667e0",

SDK Sample

Java SDK

```
QueryVCenterAction action = new QueryVCenterAction();
action.conditions = asList("uuid=70118e1db5084255a0e44c7af24d57b7");
action.sessionId = "10dbde6695b74150878bec7cbe97eda5";
QueryVCenterAction.Result res = action.call();
```

Python SDK

```
QueryVCenterAction action = QueryVCenterAction()
action.conditions = ["uuid=4e5f668c85be4bb4a1b5990611ad806b"]
action.sessionId = "708e5e17b29a4527a8480faadd49fdbbc"
QueryVCenterAction.Result res = action.call()
```

5.8.1.3 DeleteVCenter

API Request

URLs

```
DELETE zstack/v1/vcenters/{uuid}?deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth cf9047b652144c11b62e7176eef5540b" \
-X DELETE http://localhost:8080/zstack/v1/vcenters/
cd00a732974e4ca99886338bac41d511?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The vCenter UUID.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
deleteMode	String	url	Optional. The delete mode . Options: Permissive Enforcing. Default mode: Permissive.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteVCenterAction action = new DeleteVCenterAction();
action.uuid = "17ab65db07b04666ad8eef6158e7532f";
action.deleteMode = "Permissive";
action.sessionId = "e8e3599ce54c41a4b5ff3322d2479844";
DeleteVCenterAction.Result res = action.call();
```

Python SDK

```
DeleteVCenterAction action = DeleteVCenterAction()
action.uuid = "f516dab538a64c5a9f0f2a55141ae439"
action.deleteMode = "Permissive"
action.sessionId = "aca4acf373b04a2fb1ad1112f540b1b3"
```

```
DeleteVCenterAction.Result res = action.call()
```

5.8.1.4 UpdateVCenter

API Request

URLs

```
PUT zstack/v1/vcenters/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateVCenter": {
    "name": "Test-VCenter",
    "description": "Test-Description",
    "username": "Test-Username",
    "password": "Test-Password",
    "domainName": "Test-DomainName",
    "port": 443
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateVCenter":{"name":"Test-VCenter","description":"Test-Description","username":"Test-Username","password":"Test-Password","domainName":"Test-DomainName","port":443.0}}' \
http://localhost:8080/zstack/v1/vcenters/08a6059f054a3866abf6302b6461e340/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.3.2

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the updateVCen ter structure)	Optional. The resource name.		2.3.2
description	String	body (contained in the updateVCen ter structure)	Optional. The detailed description of the resource.		2.3.2
username	String	body (contained in the updateVCen ter structure)	Optional.		2.3.2
password	String	body (contained in the updateVCen ter structure)	Optional.		2.3.2
domainName	String	body (contained in the updateVCen ter structure)	Optional.		2.3.2
port	Integer	body (contained in the updateVCen ter structure)	Optional.		2.3.2
state	String	body (contained in the updateVCen ter structure)	Optional. VCenter Enable Status.		4.8.0
systemTags	List	body	Optional. The system tags.		2.3.2

Name	Type	Location	Description	Optional Value	Starting Version
userTags	List	body	Optional. The user tags.		2.3.2

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "6c42846814243c408a225e3738a2440f",
    "name": "Test-VCenter",
    "description": "Test-Description",
    "domainName": "Test-DomainName",
    "userName": "Test-Username",
    "password": "Test-Password"
  }
}
```

Name	Type	Description	Starting Version
success	boolean		4.8.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.3.2
inventory	VCenterInventory	See inventory .	2.3.2

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6

Name	Type	Description	Starting Version
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
name	String	The resource name.	0.6
description	String	The detailed description of the resource.	0.6
domainName	String		0.6
port	Integer		0.6
userName	String		0.6
zoneUuid	String	The zone UUID.	0.6
https	Boolean		0.6
state	String		0.6
status	String		0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6

SDK Sample

Java SDK

```
UpdateVCenterAction action = new UpdateVCenterAction();
action.uuid = "08a6059f054a3866abf6302b6461e340";
action.name = "Test-VCenter";
action.description = "Test-Description";
action.username = "Test-Username";
```

```

action.password = "Test-Password";
action.domainName = "Test-DomainName";
action.port = 443;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateVCenterAction.Result res = action.call();

```

Python SDK

```

UpdateVCenterAction action = UpdateVCenterAction()
action.uuid = "08a6059f054a3866abf6302b6461e340"
action.name = "Test-VCenter"
action.description = "Test-Description"
action.username = "Test-Username"
action.password = "Test-Password"

action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateVCenterAction.Result res = action.call()

```

5.8.1.5 SyncVCenter

API Request

URLs

```
PUT zstack/v1/vcenters/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```

{
  "syncVCenter": {},
  "systemTags": [],
  "userTags": []
}

```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"syncVCenter":{}}' \
http://localhost:8080/zstack/v1/vcenters/
ada8b8f96b3033bc9420c13bba7d51b9/actions

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The vCenter UUID.		2.2
systemTags	List	body	Optional. The system tags.		2.2
userTags	List	body	Optional. The user tags.		2.2

API Response

Sample Response

```

deviceId	Integer		4.5.3
state	String	The running state of the volume.	4.5.3
status	String	The ready status of the volume.	4.5.3
createDate	Timestamp	The creation time.	4.5.3
lastOpDate	Timestamp	The last operation time.	4.5.3
isShareable	Boolean	The sharing mode of the volume.	4.5.3
volumeQos	String	The volume QoS. Syntax sample: total=1048576	4.5.3

#vmCdRoms

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	4.5.3
vmInstanceUuid	String	The VM instance UUID.	4.5.3
deviceId	Integer	The drive sequence number.	4.5.3
isoUuid	String	The ISO image UUID.	4.5.3
isoInstallPath	String	The mount path of the ISO image.	4.5.3
name	String	The resource name.	4.5.3
description	String	The detailed description of the resource.	4.5.3
createDate	Timestamp	The creation time.	4.5.3
lastOpDate	Timestamp	The last operation time.	4.5.3

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.5.3
description	String	The brief description of the error.	4.5.3
details	String	The details about the error.	4.5.3
elaboration	String	The reserved field. Default value: null.	4.5.3
opaque	LinkedHashMap	The reserved field. Default value: null.	4.5.3
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.5.3

SDK Sample

Java SDK

```
SyncVCenterAction action = new SyncVCenterAction();
action.uuid = "ada8b8f96b3033bc9420c13bba7d51b9";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
SyncVCenterAction.Result res = action.call();
```

Python SDK

```
SyncVCenterAction action = SyncVCenterAction()
action.uuid = "ada8b8f96b3033bc9420c13bba7d51b9"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
SyncVCenterAction.Result res = action.call()
```

5.8.1.6 QueryVCenterCluster

API Request

URLs

```
GET zstack/v1/vcenters/clusters
GET zstack/v1/vcenters/clusters/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b4ad190088e14bb89ad9594fd311a9b9" \
-X GET http://localhost:8080/zstack/v1/vcenters/clusters?
q=uuid=82019f6ef752427480de4812339149bd
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth e2545e88cc674f52bb6d9dd3954e8ea7" \
-X GET http://localhost:8080/zstack/v1/vcenters/clusters/
ccf3e1c048d84ebbad90802a7bd0907c
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryVCenterCluster`, and pressing the **Tab** key.

API Response

Sample Response

```
{
  "inventories": [
    {

      "type": "vmware"
    }
  ]
}
```

}

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.9.0
inventories	List	See inventories .	3.9.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.9.0
description	String	The brief description of the error.	3.9.0
details	String	The details about the error.	3.9.0
elaboration	String	The reserved field. Default value: null.	3.9.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.9.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.9.0

#inventories

Name	Type	Description	Starting Version
vCenterUuid	String	The vCenter UUID.	3.9.0
dataCenterUuid	String	The data center UUID.	3.9.0

Name	Type	Description	Starting Version
morval	String	The morval.	3.9.0
name	String	The resource name.	3.9.0
uuid	String	The resource UUID.	3.9.0
description	String	The detailed description of the resource.	3.9.0
state	String	The state.	3.9.0
hypervisorType	String	The hypervisor type.	3.9.0
createDate	Timestamp	The creation date.	3.9.0
lastOpDate	Timestamp	The last operation date.	3.9.0
zoneUuid	String	The zone UUID.	3.9.0
type	String	The cluster type.	3.9.0

SDK Sample

Java SDK

```
QueryVCenterClusterAction action = new QueryVCenterClusterAction();
action.conditions = asList("uuid=1197f1e666b24da9b96ca15b76d23029");
action.sessionId = "833bf9348c13481792af75ade4d2d0fb";
QueryVCenterClusterAction.Result res = action.call();
```

Python SDK

```
QueryVCenterClusterAction action = QueryVCenterClusterAction()
action.conditions = ["uuid=99e19ea5de35490f8f78f2b2c54e867b"]
action.sessionId = "bbfbaeaa067840879cbc285146514152"
QueryVCenterClusterAction.Result res = action.call()
```

5.8.1.7 QueryVCenterPrimaryStorage

API Request

URLs

```
GET zstack/v1/vcenters/primary-storage
```

```
GET zstack/v1/vcenters/primary-storage/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 0d623b631fd7402d83b9ff2b25bdd831" \
-X GET http://localhost:8080/zstack/v1/vcenters/primary-storage?
q=uuid=981850c9581d4ffb9df096112f902031
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth c9d5f42a19d745c6928da0cd5325e1d6" \
-X GET http://localhost:8080/zstack/v1/vcenters/primary-storage/
d51815cfb0974e168f18578618474f75
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryVCenterPrimaryStorage`, and pressing the **Tab** key.

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
QueryVCenterPrimaryStorageAction action = new QueryVCenterPrimaryS
torageAction();
action.conditions = asList("uuid=252afc9b92b34337adda34baa66f41c4");
action.sessionId = "0574d9e353cb434cb8873871d6c312ba";
QueryVCenterPrimaryStorageAction.Result res = action.call();
```

Python SDK

```
QueryVCenterPrimaryStorageAction action = QueryVCenterPrimaryS
torageAction()
action.conditions = ["uuid=9fad4c72758b46d38c0866e460ef4b46"]
action.sessionId = "ceba885251524d33a45220db9b465a9e"
```

```
QueryVCenterPrimaryStorageAction.Result res = action.call()
```

5.8.1.8 QueryVCenterBackupStorage

API Request

URLs

```
GET zstack/v1/vcenters/backup-storage
GET zstack/v1/vcenters/backup-storage/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 7ef3836bac52419aad77c40b44fffb75" \
-X GET http://localhost:8080/zstack/v1/vcenters/backup-storage?
q=uuid=5557b285420b48b0b8c9bcea75b8b118
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 5176427af8404b40b3fdc2faa26790d1" \
-X GET http://localhost:8080/zstack/v1/vcenters/backup-
storage/59ca8b1caccf41eca787b0fbd354bde9
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryVCenterBackupStorage`, and pressing the **Tab** key.

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
QueryVCenterBackupStorageAction action = new QueryVCenterBackupStorageAction();
action.conditions = asList("uuid=7557d599e0204b11b4dbf0d1dca47218");
action.sessionId = "76854653db20477199d441bc07a74552";
```

```
QueryVCenterBackupStorageAction.Result res = action.call();
```

Python SDK

```
QueryVCenterBackupStorageAction action = QueryVCenterBackupStorageAction()
action.conditions = ["uuid=ea80ba3ee9de4938a148d5b29fdc1780"]
action.sessionId = "365e725adbea460b9352adf7848a7026"
QueryVCenterBackupStorageAction.Result res = action.call()
```

5.8.1.9 QueryVCenterResourcePool

API Request

URLs

```
GET zstack/v1/vcenters/clusters/resourcepools
```

```
GET zstack/v1/vcenters/clusters/resourcepools/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \

Java SDK

```
GetAllMetricMetadataAction action = new GetAllMetricMetadataAction();
action.name = "VMHAProcess";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetAllMetricMetadataAction.Result res = action.call();
```

Python SDK

```
GetAllMetricMetadataAction action = GetAllMetricMetadataAction()
action.name = "VMHAProcess"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
GetAllMetricMetadataAction.Result res = action.call()
```

6.1.1.1.2 GetMetricLabelValue

API Request

URLs

```
GET zstack/v1/zwatch/metrics/label-values
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/
zwatch/metrics/label-values?namespace=ZStack/
VM&metricName=CPUIIdleUtilization&startTime=1.58806818E9&endTime=1.58806824E9&labelNames=
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
namespace	String	query	The namespace.		2.3
metricName	String	query	The metric name.		2.3
labelNames	List	query	The name list of the target labels.		2.3
filterLabels	List	query	Optional. The label filter list. For example, you can set the HostUuid label to e47f7145f4cd4fca8e2856038ecd3e1 to filter values specified in labelNames.		2.3

Name	Type	Location	Description	Optional Value	Starting Version
startTime	Long	query	Optional. The start time.		3.9.0
endTime	Long	query	Optional. The end time.		3.9.0
systemTags	List	query	Optional. The system tags.		2.3
userTags	List	query	Optional. The user tags.		2.3

API Response

Sample Response

```
{
  "labels": [
    {
      "VMUuid": "e47f7145f4cd4fca8e2856038ecdf3e1",
      "CPUNum": "1"
    }
  ]
}
```

Name	Type	Description	Starting Version
labels	List	The label values.	0.6
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6

Name	Type	Description	Starting Version
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

SDK Sample

Java SDK

```
GetMetricLabelValueAction action = new GetMetricLabelValueAction();
action.namespace = "ZStack/VM";
action.metricName = "CPUIdleUtilization";
action.startTime = 1.58806818E9;

```

```
GetMetricLabelValueAction.Result res = action.call()
```

6.1.1.1.3 GetMetricData

API Request

URLs

```
GET zstack/v1/zwatch/metrics
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/zwatch/metrics?
namespace=ZStack/
VM&metricName=CPUIdleUtilization&startTime=1.588831825415E12&period=30.0&labels=V
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
namespace	String	query	The namespace.		2.3
metricName	String	query	The metric name.		2.3
startTime	Long	query	Optional. The start time.		2.3
endTime	Long	query	Optional. The end time.		2.3
period	Integer	query	Optional. The interval for returning data.		2.3
labels	List	query	Optional. The filter labels.		2.3
systemTags	List	query	Optional. The system tags.		2.3
userTags	List	query	Optional. The user tags.		2.3

Name	Type	Location	Description	Optional Value	Starting Version
functions	List	query	Optional. The function list.		2.3
offsetAheadOfCurrentTime	Long	query	Optional.		2.3

API Response

Sample Response

```
{
  "data": [
    {
      "value": 101.02,

      }
    }
  ]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.3
data	List	See data .	2.3

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6

Name	Type	Description	Starting Version
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#data

Name	Type	Description	Starting Version
value	double	The metric value.	0.6
time	long	The time when the record was generated.	0.6
labels	Map	The label values.	0.6

SDK Sample

Java SDK

```
GetMetricDataAction action = new GetMetricDataAction();
action.namespace = "ZStack/VM";
action.metricName = "CPUIdleUtilization";
action.startTime = 1.519829246005E12;
action.period = 30.0;
action.labels = asList("VMUuid=3bb5b754320a4331bd907f10d8683568", "
CPUNum=4");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetMetricDataAction.Result res = action.call();
```

Python SDK

```
GetMetricDataAction action = GetMetricDataAction()
action.namespace = "ZStack/VM"
action.metricName = "CPUIdleUtilization"
action.startTime = 1.519829246005E12
action.period = 30.0
action.labels = [VMUuid=b577cfe6aad447c1b2e793fdc6d7975b, CPUNum=4]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
GetMetricDataAction.Result res = action.call()
```

6.1.1.1.4 PutMetricData

API Request

URLs

```
POST zstack/v1/zwatch/metrics
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "namespace": "MyNameSpace",
    "data": [
      {
        "metricName": "UserDefinedName",
        "value": 100.01,
        "labels": {
          "label1": "value1"
        }
      }
    ]
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"namespace":"MyNameSpace","data":
[{"metricName":"UserDefinedName","value":100.01,"labels":
{"label1":"value1"}}]}}' \
http://localhost:8080/zstack/v1/zwatch/metrics
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
namespace	String	body (contained in the params structure)	The custom namespace.		2.3
data	List	body (contained in the params structure)	The data.		2.3
systemTags	List	body	Optional. The system tags.		2.3
userTags	List	body	Optional. The user tags.		2.3

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
PutMetricDataAction action = new PutMetricDataAction();
action.namespace = "MyNameSpace";
action.data = asList([metricName:UserDefinedName, value:100.01, labels
:[label1:value1]]);
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
PutMetricDataAction.Result res = action.call();
```

Python SDK

```
PutMetricDataAction action = PutMetricDataAction()
action.namespace = "MyNameSpace"
action.data = [[metricName:UserDefinedName, value:100.01, labels:[
label1:value1]]]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
PutMetricDataAction.Result res = action.call()
```

6.1.1.1.2 Event Operations

6.1.1.1.2.1 GetAllEventMetadata

API Request

URLs

```
GET zstack/v1/zwatch/events/meta-data
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/zwatch/events/meta-data
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	query	Optional. The name of the event.		3.9.0
namespace	String	query	Optional. The namespace of the event.		3.9.0
systemTags	List	query	Optional. The system tags.		0.6
userTags	List	query	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "events": [
    {
      "namespace": "ZStack/VM",
      "name": "org.zstack.zwatch.datatype.EventFamily@631b5229",
      "description": "VMHAProcess",

```

```

    "labelNames": [
      "HAProcess",
      "HADetails"
    ]
  ]
}

```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.3
events	List	See events .	2.3

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#events

Name	Type	Description	Starting Version
namespace	String	The namespace.	2.3
name	String	The resource name.	2.3
description	String	The description of the event.	3.9.0
labelNames	List	The label names.	2.3

SDK Sample

Java SDK

```
GetAllEventMetadataAction action = new GetAllEventMetadataAction();
action.name = "VMHAProcess";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetAllEventMetadataAction.Result res = action.call();
```

Python SDK

```
GetAllEventMetadataAction action = GetAllEventMetadataAction()
action.name = "VMHAProcess"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetAllEventMetadataAction.Result res = action.call()
```

6.1.1.1.2.2 GetEventData

API Request

URLs

```
GET zstack/v1/zwatch/events
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/zwatch/events?
startTime=1.596444516295E12&limit=10.0&conditions=HostUuid=99ca12b945a8489c93a341
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
startTime	Long	query	Optional. The start time.		2.3
endTime	Long	query	Optional. The end time.		2.3
limit	Integer	query	Optional. The maximum number of returned items.		2.3
offsetAheadOfCurrentTime	Long	query	Optional. The offset (in milliseconds) between the query time and the current time. Note that the query time is earlier than the current time. For example, if you query messages collected in the last one hour, 3600000 (the offset) will be transferred to the system.		3.3.0
conditions	List	query	Optional. The filter conditions.		3.3.0
count	boolean	query	Optional. Whether to query the number of events.		3.3.0

Name	Type	Location	Description	Optional Value	Starting Version
endpointUuid	String	query	Optional. Endpoint UUID.		3.3.0
systemTags	List	query	Optional. The system tags.		2.3
userTags	List	query	Optional. The system tags.		2.3

API Response

Sample Response

```
{
  "events": [
    {
      "namespace": "ZStack/VM",
      "name": "org.zstack.zwatch.datatype.EventFamily@2c24d960",
      "labels": {},
      "emergencyLevel": "Normal",
      "resourceId": "b7bbe5fb9ab049c5a36bf8a646471cff",
      "resourceName": "VmInstanceV0",
      "time": 1.596444516324E12
    }
  ]
}
```

Name	Type	Description	Starting Version
total	Long	The number of the events.	3.3.0
success	boolean		3.3.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.3
events	List	See events .	2.3

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or	2.3

Name	Type	Description	Starting Version
		alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	
description	String	The brief description of the error.	2.3
details	String	The details about the error.	2.3
elaboration	String	The reserved field. Default value: null.	2.3
opaque	LinkedHashMap	The reserved field. Default value: null.	2.3
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	2.3

#events

Name	Type	Description	Starting Version
namespace	String	The namespace.	2.3
name	String	The event name.	2.3
labels	Map	The labels.	2.3
resourceId	String	The UUID of the resource whose event was generated. If not null, the corresponding alarming messages for the associated resources are triggered.	2.3
resourceName	String	The resource name.	2.3
error	String	If the event means the error, this field is the details about the error.	2.3

Name	Type	Description	Starting Version
time	long	The time when the event was triggered.	2.3
dataUuid	String	The data UUID.	3.3
accountUuid	String	The account UUID.	3.3
emergencyLevel	EmergencyLevel	See emergencyLevel .	2.3

#emergencyLevel

Name	Type	Description	Starting Version
name	String	The resource name.	2.3
ordinal	int		2.3

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	2.3
description	String	The brief description of the error.	2.3
details	String	The details about the error.	2.3
elaboration	String	The reserved field. Default value: null.	2.3
opaque	LinkedHashMap	The reserved field. Default value: null.	2.3
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	2.3

SDK Sample

Java SDK

```
GetEventDataAction action = new GetEventDataAction();
action.startTime = 1.596444516404E12;
action.limit = 10.0;
action.conditions = asList("HostUuid=00d80d7c47124d6d8e2c7736e9af1c34");
action.count = false;
action.start = 0.0;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetEventDataAction.Result res = action.call();
```

Python SDK

```
GetEventDataAction action = GetEventDataAction()
action.startTime = 1.596444516405E12
action.limit = 10.0
action.conditions = [HostUuid=7581302347d0439fbdde32b914e2449a]
action.count = false
action.start = 0.0
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"

```

6.1.1.1.2.3 UpdateEventData

API Request

URLs

```
PUT zstack/v1/zwatch/events/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateEventData": {
    "dataUuid": "a24e9918fdf83d0aae19846bd52411e4",
    "updateMode": "OnlyOne",
    "readStatus": "Read"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateEventData":
{"dataUuid":"a24e9918fdf83d0aae19846bd52411e4","updateMode":"OnlyOne","readStatus":
http://localhost:8080/zstack/v1/zwatch/events/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
dataUuid	String	body (contained in the updateEventData structure)	Optional. The start time of the target messages. Make sure that InRange is transferred to updateMode .		3.3.0
dataStartTime	Long	body (contained in the updateEventData structure)	Optional. The start time of the target messages. Make sure that InRange is transferred to updateMode .		3.3.0
dataEndTime	Long	body (contained in the updateEventData structure)	Optional. The end time of the target messages. Make sure that InRange is transferred to updateMode .		3.3.0
updateMode	String	body (contained in the updateEven	The range of the target messages to	- OnlyOne - InRange - All	3.3.0

Name	Type	Location	Description	Optional Value	Starting Version
		tData structure)	be updated. Options: • OnlyOne: updates only the specified messages. • InRange: updates the messages generated in a specified time range. • All: updates all messages.		
readStatus	String	body (contained in the updateEventData structure)	Optional. The read status of the updated messages.	• Read • Unread	3.3.0
systemTags	List	body	Optional. The system tags.		3.3.0
userTags	List	body	Optional. The user tags.		3.3.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
UpdateEventDataAction action = new UpdateEventDataAction();
action.dataUuid = "a24e9918fdf83d0aae19846bd52411e4";
action.updateMode = "OnlyOne";
action.readStatus = "Read";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateEventDataAction.Result res = action.call();
```

Python SDK

```
UpdateEventDataAction action = UpdateEventDataAction()
action.dataUuid = "a24e9918fdf83d0aae19846bd52411e4"
action.updateMode = "OnlyOne"
action.readStatus = "Read"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateEventDataAction.Result res = action.call()
```

6.1.1.1.3 Alarm Operations

action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CreateAlarmAction.Result res = action.call()

```

6.1.1.1.3.2 DeleteAlarm

API Request

URLs

```
DELETE zstack/v1/zwatch/alarms/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/zwatch/
alarms/2aae360b1240374696d79a0cca10bf24

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.3
deleteMode	String	body	Optional.		2.3
systemTags	List	body	Optional. The system tags.		2.3
userTags	List	body	Optional. The user tags.		2.3

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteAlarmAction action = new DeleteAlarmAction();
action.uuid = "2aae360b1240374696d79a0cca10bf24";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteAlarmAction.Result res = action.call();
```

Python SDK

```
DeleteAlarmAction action = DeleteAlarmAction()
action.uuid = "2aae360b1240374696d79a0cca10bf24"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteAlarmAction.Result res = action.call()
```

6.1.1.1.3.3 UpdateAlarm

API Request

URLs

```
PUT zstack/v1/zwatch/alarms/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateAlarm": {
    "name": "VM CPU Alarm",
    "comparisonOperator": "LessThanOrEqualTo",
    "period": 60.0,
    "enableRecovery": true
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateAlarm":{"name":"VM CPU
Alarm","comparisonOperator":"LessThanOrEqualTo","period":60.0,"enableRecovery":t
http://localhost:8080/zstack/v1/zwatch/
alarms/28397feb3d083fdc9346edb066fbf589/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.3
name	String	body (contained in the updateAlarm structure)	Optional. The resource name.		2.3
description	String	body (contained in the updateAlarm structure)	Optional. The detailed description of the resource.		2.3
comparison Operator	String	body (contained in the updateAlarm structure)	Optional. The threshold comparison operator.	• GreaterThanOrEqualTo • GreaterThan • LessThan • LessThanOrEqualTo	2.3
period	Integer	body (contained in the	Optional. The threshold duration.		2.3

Name	Type	Location	Description	Optional Value	Starting Version
		updateAlarm structure)			
threshold	Double	body (contained in the updateAlarm structure)	Optional. The threshold.		2.3
repeatInterval	Integer	body (contained in the updateAlarm structure)	Optional. The alarm repeat interval.		2.3
repeatCount	Integer	body (contained in the updateAlarm structure)	Optional. The alarm repeat count.		3.3.0
systemTags	List	body	Optional. The system tags.		2.3
userTags	List	body	Optional. The user tags.		2.3
repeatCount	Integer	body (contained in the updateAlarm structure)	Optional. The alarm repeat count.		3.2
enableRecovery	Boolean	body (contained in the updateAlarm structure)	Optional. Whether to enable the recovery notification.		3.4.0
emergencyLevel	String	body (contained in the updateAlarm structure)	The alarm emergency level.	• Emergent • Important • Normal	3.8.0

SDK Sample

Java SDK

```
UpdateAlarmLabelAction action = new UpdateAlarmLabelAction();
action.uuid = "3c228226ca213c18b54627668dd37d80";
action.key = "VMUuid";
action.value = "1a33d5ce225241e0b2cbc80123e36351";
action.operator = "Equal";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
UpdateAlarmLabelAction.Result res = action.call();
```

Python SDK

```
UpdateAlarmLabelAction action = UpdateAlarmLabelAction()
action.uuid = "3c228226ca213c18b54627668dd37d80"
action.key = "VMUuid"
action.value = "20034c6b21a24918912857c8ed923c6b"
action.operator = "Equal"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateAlarmLabelAction.Result res = action.call()
```

6.1.1.1.3.9 RemoveLabelFromAlarm

API Request

URLs

```
DELETE zstack/v1/zwatch/alarms/labels/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/zwatch/alarms/
labels/160037fc792d3815ba25fe8a48d1b237
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.3
deleteMode	String	body	Optional. The delete mode.		2.3
systemTags	List	body	Optional. The system tags.		2.3
userTags	List	body	Optional. The user tags.		2.3

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
RemoveLabelFromAlarmAction action = new RemoveLabelFromAlarmAction();
action.uuid = "160037fc792d3815ba25fe8a48d1b237";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
RemoveLabelFromAlarmAction.Result res = action.call();
```

Python SDK

```
RemoveLabelFromAlarmAction action = RemoveLabelFromAlarmAction()
action.uuid = "160037fc792d3815ba25fe8a48d1b237"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
RemoveLabelFromAlarmAction.Result res = action.call()
```

6.1.1.1.3.10 ChangeAlarmState

API Request

URLs

```
PUT zstack/v1/zwatch/alarms/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeAlarmState": {
    "stateEvent": "disable"
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"changeAlarmState":{"stateEvent":"disable"}}'
http://localhost:8080/zstack/v1/zwatch/
alarms/226149ca389f387e95d0f671bd6b551f/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.3
stateEvent	String	body (contained in the changeAlarmState structure)	The state event.	- enabled - disabled	2.3
systemTags	List	body	Optional. The system tags.		2.3

QueryAlarmAction.Result res = action.call();
```

Python SDK

```
QueryAlarmAction action = QueryAlarmAction()
action.conditions = ["name=VM"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
QueryAlarmAction.Result res = action.call()
```

6.1.1.1.3.12 GetAlarmData

API Request

URLs

```
GET zstack/v1/zwatch/alarm-histories
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \  
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \  
-X GET http://localhost:8080/zstack/v1/zwatch/alarm-histories? \  
startTime=1.596444525E9&endTime=1.596530925E9&limit=200.0&count=false&excludeOther
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
startTime	Long	query	Optional. The start time.		2.3
endTime	Long	query	Optional. The end time.		2.3
limit	Integer	query	Optional. The maximum number of returned records.		2.3
conditions	List	query	Optional. The conditions to filter the results.		2.3
count	boolean	query	Optional. Whether to query the message count.		3.3.0

Name	Type	Location	Description	Optional Value	Starting Version
excludeOtherAccount	boolean	query	Optional. Whether to exclude messages other than the current account (only effective for SystemAdmin).		3.3.0
endpointUuid	String	query	Optional. The endpoint UUID.		3.10.0
systemTags	List	query	Optional. The system tags.		2.3
userTags	List	query	Optional. The user tags.		2.3

API Response

Sample Response

```
{
  "histories": [
    {
      "alarmUuid": "143b24a12d193c1992c4774dc3b34fda",
      "namespace": "ZStack/VM",
      "metricName": "CPUUsedUtilization",
      "accountUuid": "90aea7a1dfe93cf7bd3379254dddbdf9",
      "resourceUuid": "4e6bb5390d3938cb9ce830a4766ee4d8",
      "resourceType": "VmInstanceV0",
      "alarmStatus": "Alarm",
      "alarmName": "test-alarm",
      "threshold": 90.0,
      "labels": "VMUuid Equal 4e6bb5390d3938cb9ce830a4766ee4d8, CPUNum Equal 2",
      "metricValue": 10.0,
      "comparisonOperator": "LessThan",
      "time": 1.510669257141E12
    }
  ]
}
```

}

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.3
histories	List	See histories .	2.3

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	2.3
description	String	The brief description of the error.	2.3
details	String	The details about the error.	2.3
elaboration	String	The reserved field. Default value: null.	2.3
opaque	LinkedHashMap	The reserved field. Default value: null.	2.3
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	2.3

#histories

Name	Type	Description	Starting Version
alarmUuid	String	The alarm UUID.	2.3
namespace	String	The namespace.	2.3

Name	Type	Description	Starting Version
metricName	String	The metric name.	2.3
accountUuid	String	The account UUID.	2.3
resourceUuid	String	The resource UUID.	2.3
resourceType	String	The resource type.	2.3
alarmStatus	String	The alarm status.	2.3
alarmName	String	The alarm name.	2.3
threshold	Double	The alarm threshold.	2.3
period	Integer	The threshold duration.	2.3
labels	String	The label list.	2.3
metricValue	Double	The metric value.	2.3
time	long	The time that the alarm record was generated.	2.3

SDK Sample

Java SDK

```
GetAlarmDataAction action = new GetAlarmDataAction();
action.startTime = 1.530856218E9;
action.endTime = 1.530942618E9;
action.limit = 200.0;
action.count = false;
action.excludeOtherAccount = false;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetAlarmDataAction.Result res = action.call();
```

Python SDK

```
GetAlarmDataAction action = GetAlarmDataAction()
action.startTime = 1.530856218E9
action.endTime = 1.530942618E9
action.limit = 200.0
action.count = false;
action.excludeOtherAccount = false;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
GetAlarmDataAction.Result res = action.call()
```

6.1.1.1.3.13 UpdateAlarmData

API Request

URLs

```
PUT zstack/v1/zwatch/alarm-histories/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateAlarmData": {
    "dataUuid": "514d4a1ed3573bf8a14ac350de0a2513",
    "updateMode": "OnlyOne",
    "readStatus": "Read"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateAlarmData":
{"dataUuid":"514d4a1ed3573bf8a14ac350de0a2513","updateMode":"OnlyOne","readStatus":
"http://localhost:8080/zstack/v1/zwatch/alarm-histories/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
dataUuid	String	body (contained in the updateAlarmData structure)	Optional. The resource UUID.		3.3.0

Name	Type	Location	Description	Optional Value	Starting Version
dataStartTime	Long	body (contained in the updateAlarmData structure)	Optional. The start time of the target messages. Make sure that InRange is transferred to updateMode .		3.3.0
dataEndTime	Long	body (contained in the updateAlarmData structure)	Optional. The end time of the target messages. Make sure that InRange is transferred to updateMode .		3.3.0
updateMode	String	body (contained in the updateAlarmData structure)	The range of the target messages to be updated. Options: • onlyOne : updates only the specified messages. • InRange: updates the messages generated in a specified time range. • All: updates all messages.	• OnlyOne • InRange • All	3.3.0

Name	Type	Location	Description	Optional Value	Starting Version
readStatus	String	body (contained in the updateAlarmData structure)	Optional. The read status of the updated messages.	• Read • Unread	3.3.0
systemTags	List	body	Optional. The system tags.		3.3.0
userTags	List	body	Optional. The user tags.		3.3.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
UpdateAlarmDataAction action = new UpdateAlarmDataAction();
action.dataUuid = "514d4a1ed3573bf8a14ac350de0a2513";
action.updateMode = "OnlyOne";
action.readStatus = "Read";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateAlarmDataAction.Result res = action.call();
```

Python SDK

```
UpdateAlarmDataAction action = UpdateAlarmDataAction()
action.dataUuid = "514d4a1ed3573bf8a14ac350de0a2513"
action.updateMode = "OnlyOne"
action.readStatus = "Read"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
UpdateAlarmDataAction.Result res = action.call()
```

6.1.1.1.3.14 UpdateActiveAlarmTemplate

API Request

URLs

```
PUT zstack/v1/zwatch/activealarms/templates/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateActiveAlarmTemplate": {
    "alarmName": "VM-CPUAverageUsedUtilization",
    "comparisonOperator": "LessThanOrEqualTo",
    "period": 60,
    "threshold": 80.0,
    "repeatInterval": 1800,
    "repeatCount": -1,
    "emergencyLevel": "Emergent"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateActiveAlarmTemplate":{"alarmName":"VM-CPUAverageUsedUtilization","comparisonOperator":"LessThanOrEqualTo","period":60,'
http://localhost:8080/zstack/v1/zwatch/activealarms/templates/
c3e82dade74732009d5f4fd0b462f65d/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The template UUID.		4.7.0

Name	Type	Location	Description	Optional Value	Starting Version
alarmName	String	body (contained in the updateActiveAlarmTemplate structure)	Optional. The template name.		4.7.0
comparisonOperator	String	body (contained in the updateActiveAlarmTemplate structure)	Optional. The threshold comparison operator.	• GreaterThanOrEqualTo • GreaterThan • LessThan • LessThanOrEqualTo	4.7.0
period	Integer	body (contained in the updateActiveAlarmTemplate structure)	Optional. The threshold comparison operator.		4.7.0
threshold	Double	body (contained in the updateActiveAlarmTemplate structure)	Optional. The threshold.		4.7.0
repeatInterval	Integer	body (contained in the updateActiveAlarmTemplate structure)	Optional. The alarm repeat interval.		4.7.0
repeatCount	Integer	body (contained in the	Optional. The alarm repeat count.		4.7.0

Name	Type	Location	Description	Optional Value	Starting Version
		updateActiveAlarmTemplate (structure)			
emergencyLevel	String	body (contained in the updateActiveAlarmTemplate structure)	Optional. The alarm emergency level.	- Emergent - Important - Normal	4.7.0
labels	String	body (contained in the updateActiveAlarmTemplate structure)	Optional.		4.7.0
systemTags	List	query	Optional. The system tags.		4.7.0
userTags	List	query	Optional. The user tags.		4.7.0

API Response

Sample Response

```
{

```

6.1.1.1.3.15 ChangeEventSubscriptionState

API Request

URLs

```
PUT zstack/v1/zwatch/change/eventSubscription/{uuid}/state
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeEventSubscriptionState": {
    "state": "Disabled"
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" /
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" /
-X PUT -d '{"changeEventSubscriptionState":{"state":"Disabled"}}'
http://localhost:8080/zstack/v1/zwatch/change/
eventSubscription/2140655d1d183a6690c0eecdabc721ec0/state
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		4.7.0
state	String	body (contained in the changeEventSubscriptionState structure)	The event alarm state.	- Enabled - Disabled	4.7.0
systemTags	List	query	Optional. The system tags.		4.7.0
userTags	List	query	Optional. The user tags.		4.7.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.3.1
inventories	List	See inventories .	2.3.1

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	2.3.1
description	String	The brief description of the error.	2.3.1
details	String	The details about the error.	2.3.1
elaboration	String	The reserved field. Default value: null.	2.3.1
opaque	LinkedHashMap	The reserved field. Default value: null.	2.3.1
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	2.3.1

#inventories

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	2.3.1
name	String	The resource name.	3.0.0
namespace	String	The namespace.	2.3.1
eventName	String	The event name.	2.3.1
lastOpDate	Timestamp	The creation date.	2.3.1
createDate	Timestamp	The last operation date.	2.3.1
state	EventSubscriptionState	See state .	2.3.1
actions	List	See actions .	2.3.1
labels	List	See labels .	2.3.1

#state

Name	Type	Description	Starting Version
name	String	The resource name.	2.3.1
ordinal	int		2.3.1

#actions

Name	Type	Description	Starting Version
subscriptionUuid	String	The event subscription UUID.	2.3.1
actionType	String	The action type.	2.3.1
actionUuid	String	The action UUID.	2.3.1

#labels

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	2.3.1
key	String	The label key.	2.3.1
value	String	The label value.	2.3.1
operator	Operator	See operator .	2.3.1

#operator

Name	Type	Description	Starting Version
op	String		2.3.1
name	String	The resource name.	2.3.1
ordinal	int		2.3.1

SDK Sample

Java SDK

```
QueryEventSubscriptionAction action = new QueryEventSubscriptionAction
();
action.conditions = asList("name=test");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
QueryEventSubscriptionAction.Result res = action.call();
```

Python SDK

```
QueryEventSubscriptionAction action = QueryEventSubscriptionAction()
action.conditions = ["name=test"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryEventSubscriptionAction.Result res = action.call()
```

6.1.1.1.4.4 UpdateEventSubscriptionLabel

API Request

URLs

```
PUT zstack/v1/zwatch/events/subscriptions/labels/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateEventSubscriptionLabel": {
    "key": "VMUuid",
    "value": "42c233c17c6e4907b7be1f11a41f3a17",
    "operator": "Equal"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateEventSubscriptionLabel":
{"key": "VMUuid", "value": "228fc2c5041248df9b0d317f6f7a8585", "operator": "Equal"}}'
http://localhost:8080/zstack/v1/zwatch/events/subscriptions/labels/
cfb859d412933a1da57ae99e2aa442ce/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The UUID of the event subscription.		3.9.0
key	String	body (contained in the updateEventSubscriptionLabel structure)	The new name of the label.		3.9.0
value	String	body (contained in the updateEventSubscriptionLabel structure)	The new value of the label.		3.9.0
operator	String	body (contained in the updateEventSubscriptionLabel structure)	The new operator of the label.	• Regex • Equal	3.9.0
systemTags	List	body	Optional. The system tags.		3.9.0
userTags	List	body	Optional. The user tags.		3.9.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "d937a1c6d9de3f2285b0cb23316624a8",
    "key": "VMUuid",
    "operator": "Equal",
    "value": "19cf33283b484ff6b73a6d98e1d762f5"
  }
}
```

}

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.9.0
inventory	EventSubscriptionLabelInventory	See inventory .	3.9.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.9.0
description	String	The brief description of the error.	3.9.0
details	String	The details about the error.	3.9.0
elaboration	String	The reserved field. Default value: null.	3.9.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.9.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.9.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.9.0

Name	Type	Description	Starting Version
key	String	The label name.	3.9.0
value	String	The label key.	3.9.0
operator	Operator	See operator .	3.9.0

#operator

Name	Type	Description	Starting Version
op	String		3.9.0
name	String	The resource name.	3.9.0
ordinal	int		3.9.0

SDK Sample

Java SDK

```
UpdateEventSubscriptionLabelAction action = new UpdateEventSubscript
ionLabelAction();
action.uuid = "cfb859d412933a1da57ae99e2aa442ce";
action.key = "VMUUid";
action.value = "9d7099dd361049aaaf801ca6b17b2858";
action.operator = "Equal";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateEventSubscriptionLabelAction.Result res = action.call();
```

Python SDK

```
UpdateEventSubscriptionLabelAction action = UpdateEventSubscript
ionLabelAction()
action.uuid = "cfb859d412933a1da57ae99e2aa442ce"
action.key = "VMUUid"
action.value = "27e59f9fe7ed46118a2f6b8a383ce494"
action.operator = "Equal"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
UpdateEventSubscriptionLabelAction.Result res = action.call()
```

6.1.1.1.5 Text Template Operations

6.1.1.1.5.1 CreateSNSTextTemplate

API Request

URLs

```
POST zstack/v1/zwatch/alarms/sns/text-templates
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "email template",
    "applicationPlatformType": "Email",
    "subject": "Alarm ${ALARM_NAME} [${ALARM_METRIC} ${ALARM_COMPARISON_OPERATOR} threshold ${ALARM_THRESHOLD}] changes status to ${ALARM_CURRENT_STATUS}",
    "recoverySubject": "Alarm ${ALARM_NAME} ${TITLE_ALARM_RESOURCE_NAME} changes status to ${ALARM_CURRENT_STATUS}",
    "template": "Alarm ${ALARM_NAME} changes status to ${ALARM_CURRENT_STATUS}",
    "recoveryTemplate": "Alarm ${ALARM_NAME} Resource ${ALARM_RESOURCE_NAME} changes status to ${ALARM_CURRENT_STATUS}",
    "defaultTemplate": true
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"name":"email template","applicationPlatformType":"Email","subject":"Alarm ${ALARM_NAME} [${ALARM_METRIC} ${ALARM_COMPARISON_OPERATOR} threshold ${ALARM_THRESHOLD}] changes status to ${ALARM_CURRENT_STATUS}","recoverySubject":"Alarm ${ALARM_NAME} ${TITLE_ALARM_RESOURCE_NAME} changes status to ${ALARM_CURRENT_STATUS}","template":"Alarm ${ALARM_NAME} changes status to ${ALARM_CURRENT_STATUS}","recoveryTemplate":"Alarm ${ALARM_NAME} Resource ${ALARM_RESOURCE_NAME} changes status to ${ALARM_CURRENT_STATUS}"}}
```

```
to ${ALARM_CURRENT_STATUS}", "defaultTemplate":true}}' http://localhost:8080/zstack/v1/zwatch/alarms/sns/text-templates
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The resource name.		2.3
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		2.3
applicationPlatformType	String	body (contained in the params structure)	The type of the SNS application platform.		2.3
template	String	body (contained in the params structure)	The template text.		2.3
recoveryTemplate	String	body (contained in the params structure)	The recovery template text , which is a string.		3.4.0
defaultTemplate	Boolean	body (contained in the params structure)	Optional. Whether to set the template as the default template.		2.3
resourceUuid	String	body (contained in the params structure)	Optional.		2.3
systemTags	List	body	Optional. The system tags.		2.3
userTags	List	body	Optional. The user tags.		2.3

Name	Type	Location	Description	Optional Value	Starting Version
type	String	body (contained in the params structure)	Optional.	- alarm - event - combined	5.1.8
tagUuids	List	body (contained in the params structure)	Optional. the tag UUID list.		5.1.8
subject	String	body (contained in the params structure)	Optional. The subject.		5.1.8
recoverySubject	String	body (contained in the params structure)	The recovery subject.		5.1.8

```

6.1.1.1.5.2 DeleteSNSTextTemplate

API Request

URLs

```
DELETE zstack/v1/zwatch/alarms/sns/text-templates/{uuid}?
deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/zwatch/alarms/sns/text-
templates/a4ce47e628303c4fa55743f1b84c61b4?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.3
deleteMode	String	url	Optional.		2.3
systemTags	List	body	Optional. The system tags.		2.3
userTags	List	body	Optional. The user tags.		2.3

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DeleteSNSTextTemplateAction action = new DeleteSNSTextTemplateAction
();
action.uuid = "a4ce47e628303c4fa55743f1b84c61b4";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteSNSTextTemplateAction.Result res = action.call();
```

Python SDK

```
DeleteSNSTextTemplateAction action = DeleteSNSTextTemplateAction()
action.uuid = "a4ce47e628303c4fa55743f1b84c61b4"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteSNSTextTemplateAction.Result res = action.call()
```

6.1.1.1.5.3 UpdateSNSTextTemplate

API Request

URLs

```
PUT zstack/v1/zwatch/alarms/sns/text-templates/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateSNSTextTemplate": {
    "name": "email template",
    "template": "Alarm ${ALARM_NAME} changes status to ${ALARM_CURR
ENT_STATUS}",

-X GET http://localhost:8080/zstack/v1/zwatch/alarms/sns/text-  
templates/aliyun-sms/f7ffc76a46233bc590acd41e1954ed29
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryAliyunSmsSNSTextTemplate**, and pressing the **Tab** key.

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{  
  "error": {  
    "code": "SYS.1001",  
    "description": "A message or a operation timeout",  
    "details": "Create VM on KVM timeout after 300s"  
  }  
}
```

SDK Sample

Java SDK

```
QueryAliyunSmsSNSTextTemplateAction action = new QueryAliyunSmsSNSTextTemplateAction();  
action.conditions = asList("smsTemplateCode=SMS_123456789");  
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";  
QueryAliyunSmsSNSTextTemplateAction.Result res = action.call();
```

Python SDK

```
QueryAliyunSmsSNSTextTemplateAction action = QueryAliyunSmsSNSTextTemplateAction()  
action.conditions = ["smsTemplateCode=SMS_123456789"]  
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
QueryAliyunSmsSNSTextTemplateAction.Result res = action.call()
```

6.1.1.1.6 Audit Operations

6.1.1.1.6.1 GetAuditData

API Request

URLs

```
GET zstack/v1/zwatch/audits
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```

Java SDK

```
CreateSNSTopicAction action = new CreateSNSTopicAction();
action.name = "api topic";
action.locale = "zh_CN";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateSNSTopicAction.Result res = action.call();
```

Python SDK

```
CreateSNSTopicAction action = CreateSNSTopicAction()
action.name = "api topic"
action.locale = "zh_CN"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
CreateSNSTopicAction.Result res = action.call()
```

6.1.1.2.2 DeleteSNSTopic

API Request

URLs

```
DELETE zstack/v1/sns/topics/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/sns/
topics/2e5e362e1a7836618d6cce49fba21e78
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.3
deleteMode	String	body	Optional.		5.0.0
systemTags	List	body	Optional. The system tags.		2.3
userTags	List	body	Optional. The user tags.		2.3

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DeleteSNSTopicAction action = new DeleteSNSTopicAction();
action.uuid = "2e5e362e1a7836618d6cce49fba21e78";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteSNSTopicAction.Result res = action.call();
```

Python SDK

```
DeleteSNSTopicAction action = DeleteSNSTopicAction()
action.uuid = "2e5e362e1a7836618d6cce49fba21e78"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteSNSTopicAction.Result res = action.call()
```

6.1.1.2.3 ChangeSNSTopicState

API Request

URLs

```
PUT zstack/v1/zwatch/topics/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeSNSTopicState": {
    "stateEvent": "disable"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"changeSNSTopicState":{"stateEvent":"disable"}}' \
```

```
http://localhost:8080/zstack/v1/zwatch/
topics/89f0adcff110385a8a8fa2568a744ab5/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.3
stateEvent	String	body (contained in the changeSNSTopicState structure)	The state event.	• enable • disable	2.3
systemTags	List	body	Optional. The system tags.		2.3
userTags	List	body	Optional. The user tags.		2.3

API Response

Sample Repossess

```
{
  "inventory": {
    "uuid": "54a92ecb4ed346e0b1af4747b65d01a7",
    "name": "new name",
    "state": "Enabled",
    "locale": "zh_CN",
    "createDate": "Dec 25, 2023 2:08:19 PM",
    "lastOpDate": "Dec 25, 2023 2:08:19 PM"
  }
}
```

Name	Type	Description	Starting Version
success	boolean		5.0.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.3
inventory	SNSTopicInventory	See inventory .	2.3

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	2.3
name	String	The resource name.	2.3
description	String	The detailed description of the resource.	2.3
state	String	The state.	2.3
lastOpDate	Timestamp	The last operation date.	2.3
createDate	Timestamp	The creation date.	2.3

SDK Sample

Java SDK

```
ChangeSNSTopicStateAction action = new ChangeSNSTopicStateAction();
action.uuid = "89f0adcff110385a8a8fa2568a744ab5";
action.stateEvent = "disable";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
ChangeSNSTopicStateAction.Result res = action.call();
```

Python SDK

```
ChangeSNSTopicStateAction action = ChangeSNSTopicStateAction()
action.uuid = "89f0adcff110385a8a8fa2568a744ab5"
action.stateEvent = "disable"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
ChangeSNSTopicStateAction.Result res = action.call()
```

6.1.1.2.4 UpdateSNSTopic

API Request

URLs

```
PUT zstack/v1/sns/topics/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateSNSTopic": {
    "name": "new name",
    "locale": "zh_CN"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateSNSTopic":{"name":"new name","locale":"zh_CN"}}' \
```

```
http://localhost:8080/zstack/v1/sns/
topics/3e7550bf8ead3f02b366df6e499dc285/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.3
name	String	body (contained in the updateSNSTopic structure)	Optional. The resource name.		2.3
description	String	body (contained in the updateSNSTopic structure)	Optional. The detailed description of the resource.		2.3
systemTags	List	body	Optional. The system tags.		2.3
userTags	List	body	Optional. The user tags.		2.3
locale	String	body (contained in the updateSNSTopic structure)	Optional. The internalization language.	- zh_CN - en_US	5.0.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "1a688d109d5e4f1b90a2b1b6b7d90c07",
    "name": "new name",
    "state": "Enabled",
    "locale": "zh_CN",
    "createDate": "Dec 25, 2023 2:06:14 PM",
    "lastOpDate": "Dec 25, 2023 2:06:14 PM"
  }
}
```

}

Name	Type	Description	Starting Version
success	boolean		5.0.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.3
inventory	SNSTopicInventory	See inventory .	2.3

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventory

state	String	The state.	2.3
createDate	Timestamp	The creation date.	2.3
lastOpDate	Timestamp	The last operation date.	2.3

SDK Sample

Java SDK

```
QuerySNSTopicAction action = new QuerySNSTopicAction();
action.conditions = asList("name=api");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QuerySNSTopicAction.Result res = action.call();
```

Python SDK

```
QuerySNSTopicAction action = QuerySNSTopicAction()
action.conditions = ["name=api"]
```

```
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QuerySNSTopicAction.Result res = action.call()
```

6.1.1.2.6 CreateSNSEmailPlatform

API Request

URLs

```
POST zstack/v1/sns/application-platforms/email
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "smtpServer": "email.zstack.io",
    "smtpPort": 20.0,
    "username": "example@zstack.io",
    "password": "password",
    "encryptType": "STARTTLS",
    "name": "email platform"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"smtpServer": "email.zstack.io", "smtpPort": 20.0, "username": "example@zstack.io", "p
platform"}}' \
http://localhost:8080/zstack/v1/sns/application-platforms/email
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
smtpServer	String	body (contained in	The SMTP server address.		2.3

Name	Type	Location	Description	Optional Value	Starting Version
		the params structure)			
smtpPort	Integer	body (contained in the params structure)	The SMTP port.		2.3
username	String	body (contained in the params structure)	The username .		2.3
password	String	body (contained in the params structure)	Optional. The password.		2.3
name	String	body (contained in the params structure)	The resource name.		2.3
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		2.3
resourceUuid	String	body (contained in the params structure)	Optional.		2.3
encryptType	String	body (contained in the params structure)	Optional.	• SSL • STARTTLS • NONE	2.3
systemTags	List	body	Optional. The system tags.		2.3
userTags	List	body	Optional. The user tags.		2.3

**Note:**

- When you add an email server, the system will automatically detect whether the username, password, email server address, email server port, and encryption type are correct. The waiting time does not exceed 5 seconds.

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "f6122105d8994b498e6184efcf03bb64",

description	String	The detailed description of the resource.	2.3
type	String	The type.	2.3
createDate	Timestamp	The creation date.	2.3
lastOpDate	Timestamp	The last operation date.	2.3

SDK Sample

Java SDK

```
CreateSNSEmailPlatformAction action = new CreateSNSEmailPlatformAction
();
action.smtpServer = "email.zstack.io";
action.smtpPort = 20.0;
action.username = "example@zstack.io";
action.password = "password";
action.encryptType = "STARTTLS";
action.name = "email platform";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateSNSEmailPlatformAction.Result res = action.call();
```

Python SDK

```
CreateSNSEmailPlatformAction action = CreateSNSEmailPlatformAction()
action.smtpServer = "email.zstack.io"
action.smtpPort = 20.0
action.username = "example@zstack.io"
action.password = "password"
action.encryptType = "STARTTLS"
action.name = "email platform"
```

```
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CreateSNSEmailPlatformAction.Result res = action.call()
```

6.1.1.2.7 ValidateSNSEmailPlatform

API Request

URLs

```
PUT zstack/v1/sns/application-platforms/email/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "validateSNSEmailPlatform": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"validateSNSEmailPlatform":{}}' \
http://localhost:8080/zstack/v1/sns/application-platforms/email/
ee6f4b67dc7e3b298353a6fe2b5d0a6f/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.3
systemTags	List	body	Optional. The system tags.		2.3
userTags	List	body	Optional. The user tags.		2.3

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
ValidateSNSEmailPlatformAction action = new ValidateSNSEmailPlatformAction();
action.uuid = "ee6f4b67dc7e3b298353a6fe2b5d0a6f";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
ValidateSNSEmailPlatformAction.Result res = action.call();
```

Python SDK

```
ValidateSNSEmailPlatformAction action = ValidateSNSEmailPlatformAction()
action.uuid = "ee6f4b67dc7e3b298353a6fe2b5d0a6f"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
ValidateSNSEmailPlatformAction.Result res = action.call()
```

6.1.1.2.8 DeleteSNSApplicationPlatform

API Request

URLs

```
DELETE zstack/v1/sns/application-platforms/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/sns/application-platforms/992bf9e24f6f3f25866956f8079ffadc
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.3
deleteMode	String	body	Optional.		5.0.0
systemTags	List	body	Optional. The system tags.		2.3
userTags	List	body	Optional. The user tags.		2.3

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteSNSApplicationPlatformAction action = new DeleteSNSApplicationPlatformAction();
action.uuid = "992bf9e24f6f3f25866956f8079ffadc";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteSNSApplicationPlatformAction.Result res = action.call();
```

Python SDK

```
DeleteSNSApplicationPlatformAction action = DeleteSNSApplicationPlatformAction()
action.uuid = "992bf9e24f6f3f25866956f8079ffadc"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
DeleteSNSApplicationPlatformAction.Result res = action.call()
```

6.1.1.2.9 QuerySNSEmailPlatform

API Request

URLs

```
GET zstack/v1/sns/application-platforms/email
GET zstack/v1/sns/application-platforms/email/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```

-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/sns/application-platforms/
email?q=name=email
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/sns/application-platforms/
email/fe6d6cd0fbf53a4eaa772f326972d765
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QuerySNSEmailPlatform`, and pressing the **Tab** key.

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
QuerySNSEmailPlatformAction action = new QuerySNSEmailPlatformAction
();
action.conditions = asList("name=email");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
QuerySNSEmailPlatformAction.Result res = action.call();
```

Python SDK

```
QuerySNSEmailPlatformAction action = QuerySNSEmailPlatformAction()
action.conditions = ["name=email"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QuerySNSEmailPlatformAction.Result res = action.call()
```

6.1.1.2.10 UpdateSNSApplicationPlatform

API Request

URLs

```
PUT zstack/v1/sns/application-platforms/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateSNSApplicationPlatform": {
    "name": "new name"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateSNSApplicationPlatform":{"name":"new name"}}' \
http://localhost:8080/zstack/v1/sns/application-
platforms/577aff1dcbe932798fd615e88813c7ce/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	Optional. The resource UUID.		2.3
name	String	body (contained in the updateSNSApplicationPlatform structure)	Optional. The resource name.		2.3
description	String	body (contained in the updateSNSApplicationPlatform structure)	Optional. The detailed description of the resource.		2.3
systemTags	List	body	Optional. The system tags.		2.3
userTags	List	body	Optional. The user tags.		2.3

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "5687e054cc0744f0b048e825b5b9475f",
    "name": "email platform",
    "description": "example description",
    "state": "Enabled",
    "type": "Email",
    "createDate": "Dec 25, 2023 2:06:02 PM",
    "lastOpDate": "Dec 25, 2023 2:06:02 PM"
  }
}
```

Name	Type	Description	Starting Version
success	boolean		5.0.0

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.3
inventory	SNSApplicationPlatformInventory	See inventory .	2.3

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	2.3
name	String	The resource name.	2.3

Name	Type	Description	Starting Version
description	String	The detailed description of the resource.	2.3
type	String	The type.	2.3
createDate	Timestamp	The creation date.	2.3
lastOpDate	Timestamp	The last operation date.	2.3

SDK Sample

Java SDK

```
UpdateSNSApplicationPlatformAction action = new UpdateSNSApplicationPlatformAction();
action.uuid = "577aff1dcbe932798fd615e88813c7ce";
action.name = "new name";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateSNSApplicationPlatformAction.Result res = action.call();
```

Python SDK

```
UpdateSNSApplicationPlatformAction action = UpdateSNSApplicationPlatformAction()
action.uuid = "577aff1dcbe932798fd615e88813c7ce"
action.name = "new name"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateSNSApplicationPlatformAction.Result res = action.call()
```

6.1.1.2.11 QuerySNSApplicationPlatform

API Request

URLs

```
GET zstack/v1/sns/application-platforms
GET zstack/v1/sns/application-platforms/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/sns/application-platforms?q=state=Enabled
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
```

```
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \  
-X GET http://localhost:8080/zstack/v1/sns/application-platforms/  
b9a635c9ff7c3544a232cad5b9a4aaf7
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QuerySNSApplicationPlatform`, and pressing the **Tab** key.

API Response

Sample Response

```
{  
  "inventories": [  
    {  
      "uuid": "c418160d00ff407986dde8bd10a7f0c4",  
      "name": "email platform",  
      "description": "example description",  
      "state": "Enabled",  
      "type": "Email",  
      "createDate": "Dec 25, 2023 2:06:03 PM",  
      "lastOpDate": "Dec 25, 2023 2:06:03 PM"  
    }  
  ]  
}
```

Name	Type	Description	Starting Version
success	boolean		5.0.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.3
inventories	List	See inventories .	2.3

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6

Name	Type	Description	Starting Version
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventories

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	2.3
name	String	The resource name.	2.3
description	String	The detailed description of the resource.	2.3
type	String	The type.	2.3
createDate	Timestamp	The creation date.	2.3
lastOpDate	Timestamp	The last operation date.	2.3

SDK Sample

Java SDK

```
QuerySNSApplicationPlatformAction action = new QuerySNSApplicationPlatformAction();
action.conditions = asList("state=Enabled");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QuerySNSApplicationPlatformAction.Result res = action.call();
```

Python SDK

```
QuerySNSApplicationPlatformAction action = QuerySNSApplicationPlatformAction()
action.conditions = ["state=Enabled"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
QuerySNSApplicationPlatformAction.Result res = action.call()
```

6.1.1.2.12 ChangeSNSApplicationPlatformState

API Request

URLs

```
PUT zstack/v1/sns/application-platforms/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeSNSApplicationPlatformState": {
    "stateEvent": "enable"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"changeSNSApplicationPlatformState":
{"stateEvent":"enable"}}' \
http://localhost:8080/zstack/v1/sns/application-platforms/
bf16a9b0315a3942afb8b7f29e1287eb/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.3
stateEvent	String	body (contained in the changeSNSA pplication)	The state event.	- enable - disable	2.3

Name	Type	Location	Description	Optional Value	Starting Version
		PlatformState structure)			
systemTags	List	body	Optional. The system tags.		2.3
userTags	List	body	Optional. The user tags.		2.3

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "c41b8b33a85b4d539684b43f0cde156b",
    "name": "email platform",
    "description": "example description",
    "state": "Enabled",
    "type": "Email",
    "createDate": "Dec 25, 2023 2:03:32 PM",
    "lastOpDate": "Dec 25, 2023 2:03:32 PM"
  }
}
```

Name	Type	Description	Starting Version
success	boolean		5.0.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.3
inventory	SNSApplicationPlatformInventory	See inventory .	2.3

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error	0.6

Name	Type	Description	Starting Version
		. For example, SYS.1000, HOST.1001.	
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	2.3
name	String	The resource name.	2.3
description	String	The detailed description of the resource.	2.3
type	String	The type.	2.3
lastOpDate	Timestamp	The last operation date.	2.3
createDate	Timestamp	The creation date.	2.3

SDK Sample

Java SDK

```
ChangeSNSApplicationPlatformStateAction action = new ChangeSNSApplicationPlatformStateAction();
action.uuid = "bf16a9b0315a3942afb8b7f29e1287eb";
action.stateEvent = "enable";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
ChangeSNSApplicationPlatformStateAction.Result res = action.call();
```

Python SDK

```
ChangeSNSApplicationPlatformStateAction action = ChangeSNSApplicationPlatformStateAction()
action.uuid = "bf16a9b0315a3942afb8b7f29e1287eb"
action.stateEvent = "enable"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
ChangeSNSApplicationPlatformStateAction.Result res = action.call()
```

6.1.1.2.13 CreateSNSEmailEndpoint

API Request

URLs

```
POST zstack/v1/sns/application-endpoints/emails
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "email": "example@zstack.io",
    "emails": [
      "example@zstack.io"
    ],
    "name": "email",
    "platformUuid": "5efc525948a537e39a91290c57d6d37b"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"email":"example@zstack.io","emails":["example@zstack.io"],"name":"email","platformUuid":"5efc525948a537e39a91290c57d6d37b"},"systemTags":[],"userTags":[]}' \
http://localhost:8080/zstack/v1/sns/application-endpoints/emails
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
email	String	body (contained in the params structure)	Optional. The email address.		2.3.0
emails	List	body (contained in the params structure)	Optional.		3.7.0
name	String	body (contained in the params structure)	The resource name.		5.0.0
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		5.0.0
platformUuid	String	body (contained in the params structure)	Optional. The application platform UUID.		5.0.0
resourceUuid	String	body (contained in the params structure)	Optional.		5.0.0
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID list.		3.7.0
systemTags	List	body	Optional. The system tags.		2.3.0
userTags	List	body	Optional. The user tags.		2.3.0

API Response

Sample Response

```
{
```

```

"inventory": {
  "name": "example",

```

```
CreateSNSEmailEndpointAction.Result res = action.call()
```

6.1.1.2.14 SNSEmailTestConnection

API Request

URLs

```
POST zstack/v1/sns/application-endpoints/email/test-connection
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "emails": [
      "example@zstack.io"
    ],
    "platformUuid": "d5904b92d6df39a5905212bde24b2946",
    "endpointUuid": "2ff88c96f20f36469bdfcd2fa84e533d",
    "subject": "test email subject",
    "text": "this is a test email of content"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"emails":
["example@zstack.io"],"platformUuid":"d5904b92d6df39a5905212bde24b2946","endpoint
email subject","text":"this is a test email of content"}}' http://
localhost:8080/zstack/v1/sns/application-endpoints/email/test-
connection
```

Request Parameters

Name	Type	Location	Description	Valid Values	Starting Version
emails	List	body (contained in the params structure)	Optional. The email addresses.		5.1.8
platformUuid	String	body (contained in the params structure)	Optional. The email platform UUID.		5.1.8
endpointUuid	String	body (contained in the params structure)	Optional. The email endpoint UUID.		5.1.8
subject	String	body (contained in the params structure)	Optional. The subject.		5.1.8
text	String	body (contained in the params structure)	Optional. The text.		5.1.8
systemTags	List	body	Optional. The system tags.		5.1.8
userTags	List	body	Optional. The user tags.		5.1.8

API Response

Sample Response

```
{
  "connected": true,
  "webhookResp": {}
}
```

Name	Type	Description	Starting Version
success	boolean		5.1.8
connected	boolean	The test text sending result.	5.1.8

Name	Type	Description	Starting Version
webhookResp	LinkedHashMap	The response from the endpoint.	5.1.8
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	5.1.8

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	5.1.8
description	String	The brief description of the error.	5.1.8
details	String	The details about the error.	5.1.8
elaboration	String	The reserved field. Default value: null.	5.1.8
opaque	LinkedHashMap	The reserved field. Default value: null.	5.1.8
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	5.1.8

SDK Sample

Java SDK

```

SNSEmailTestConnectionAction action = new SNSEmailTestConnectionAction
();
action.emails = asList("example@zstack.io");
action.platformUuid = "d5904b92d6df39a5905212bde24b2946";
action.endpointUuid = "2ff88c96f20f36469bdfcd2fa84e533d";

```

```
action.subject = "test email subject";
action.text = "this is a test email of content";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
SNSEmailTestConnectionAction.Result res = action.call();
```

Python SDK

```
SNSEmailTestConnectionAction action = SNSEmailTestConnectionAction()
action.emails = [example@zstack.io]
action.platformUuid = "d5904b92d6df39a5905212bde24b2946"
action.endpointUuid = "2ff88c96f20f36469bdfcd2fa84e533d"
action.subject = "test email subject"
action.text = "this is a test email of content"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
SNSEmailTestConnectionAction.Result res = action.call()
```

6.1.1.2.15 QuerySNSEmailEndpoint

API Request

URLs

```
GET zstack/v1/sns/application-endpoints/emails
GET zstack/v1/sns/application-endpoints/emails/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/sns/application-endpoints/
emails?q=email=test@zstack.io
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/sns/application-endpoints/
emails/bbae379b811f3d18a422d73557ece1b1
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QuerySNSEmailEndpoint`, and pressing the **Tab** key.

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
```

```

        "code": "SYS.1001",
        "description": "A message or a operation timeout",
        "details": "Create VM on KVM timeout after 300s"
    }
}

```

SDK Sample

Java SDK

```

QuerySNSEmailEndpointAction action = new QuerySNSEmailEndpointAction
();
action.conditions = asList("email=test@zstack.io");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QuerySNSEmailEndpointAction.Result res = action.call();

```

Python SDK

```

QuerySNSEmailEndpointAction action = QuerySNSEmailEndpointAction()
action.conditions = ["email=test@zstack.io"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QuerySNSEmailEndpointAction.Result res = action.call()

```

6.1.1.2.16 CreateSNSHttpEndpoint

API Request

URLs

```
POST zstack/v1/sns/application-endpoints/http
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```

{
  "params": {
    "url": "http://127.0.0.1:6666/test-url",
    "username": "username",
    "password": "password",
    "name": "http"
  },
  "systemTags": [],
  "userTags": []
}

```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"url":"http://127.0.0.1:6666/test-url","username":"username","password":"password","name":"http"}}' \
http://localhost:8080/zstack/v1/sns/application-endpoints/http
```

Request Parameters

Name	Type	Location	Description	Optimal Value	Starting Version
url	String	body (contained in the params structure)	The HTTP webhook URL.		2.3
username	String	body (contained in the params structure)	Optional. The username of the URL.		2.3
password	String	body (contained in the params structure)	Optional. The password of the URL.		2.3
name	String	body (contained in the params structure)	The resource name.		2.3
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		2.3
resourceUuid	String	body (contained in the params structure)	Optional.		2.3
systemTags	List	body	Optional. The system tags.		2.3
userTags	List	body	Optional. The user tags.		2.3

Name	Type	Location	Description	Optimal Value	Starting Version
platformUuid	String	body (contained in the params structure)	Optional.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
CreateSNSHttpEndpointAction action = new CreateSNSHttpEndpointAction
();
action.url = "http://127.0.0.1:6666/test-url";
action.username = "username";
action.password = "password";
action.name = "http";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateSNSHttpEndpointAction.Result res = action.call();
```

Python SDK

```
CreateSNSHttpEndpointAction action = CreateSNSHttpEndpointAction()
action.url = "http://127.0.0.1:6666/test-url"
action.username = "username"
action.password = "password"
action.name = "http"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
CreateSNSHttpEndpointAction.Result res = action.call()
```

6.1.1.2.17 SNSHttpTestConnection

API Request

URLs

```
POST zstack/v1/sns/application-endpoints/http/test-connection
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "url": "https://open.feishu.cn/open-apis/bot/v2/hook/006879a3-0898-4428-aad4-3221db3daf81",
    "username": "admin",

  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"url":"https://open.feishu.cn/open-apis/bot/v2/hook/006879a3-0898-4428-aad4-3221db3daf81","username":"admin","password":"password","endpointUuid":"1c201c27a81740ddadbc5d2f3f38a5e4"},"systemTags":[],"userTags":[]}' http://localhost:8080/zstack/v1/sns/application-endpoints/http/test-connection
```

Request Parameters

Name	Type	Location	Description	Valid Values	Starting Version
url	String	body (contained in	Optional. The webhook URL.		5.1.8

Name	Type	Location	Description	Valid Values	Starting Version
		the params structure)			
username	String	body (contained in the params structure)	Optional. The Basic Auth user name.		5.1.8
password	String	body (contained in the params structure)	Optional. The Basic Auth password.		5.1.8
endpointUuid	String	body (contained in the params structure)	Optional. The endpoint UUID .		5.1.8
systemTags	List	body	Optional. The system tags.		5.1.8
userTags	List	body	Optional. The user tags.		5.1.8

API Response

Sample Response

```
{
  "connected": true,
  "webhookResp": "{\u0027result\u0027: \u0027success\u0027}"
}
```

Name	Type	Description	Starting Version
success	boolean		5.1.8
connected	boolean	The test text sending result.	5.1.8
webhookResp	LinkedHashMap	The response from the endpoint.	5.1.8
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For	5.1.8

Name	Type	Description	Starting Version
		more information, see error	

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	5.1.8
description	String	The brief description of the error.	5.1.8
details	String	The details about the error.	5.1.8
elaboration	String	The reserved field. Default value: null.	5.1.8
opaque	LinkedHashMap	The reserved field. Default value: null.	5.1.8
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	5.1.8

SDK Sample

Java SDK

```
SNSHttpTestConnectionAction action = new SNSHttpTestConnectionAction
();
action.url = "https://open.feishu.cn/open-apis/bot/v2/hook/006879a3-
0898-4428-aad4-3221db3daf81";
action.username = "admin";
action.password = "password";
action.endpointUuid = "1c201c27a81740ddadbc5d2f3f38a5e4";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
SNSHttpTestConnectionAction.Result res = action.call();
```

Python SDK

```
SNSHttpTestConnectionAction action = SNSHttpTestConnectionAction()
action.url = "https://open.feishu.cn/open-apis/bot/v2/hook/006879a3-0898-4428-aad4-3221db3daf81"
action.username = "admin"
action.password = "password"
action.endpointUuid = "1c201c27a81740ddadbc5d2f3f38a5e4"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
SNSHttpTestConnectionAction.Result res = action.call()
```

6.1.1.2.18 QuerySNSHttpEndpoint

API Request

URLs

```
GET zstack/v1/sns/application-endpoints/http
GET zstack/v1/sns/application-endpoints/http/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/sns/application-endpoints/http?
q=url=http://url
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/sns/application-endpoints/http/
cbd9163bb4683e10b8a5025621e36862
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QuerySNSHttpEndpoint`, and pressing the **Tab** key.

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
}
```

SDK Sample

Java SDK

```
QuerySNSHttpEndpointAction action = new QuerySNSHttpEndpointAction();
action.conditions = asList("url=http://url");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QuerySNSHttpEndpointAction.Result res = action.call();
```

Python SDK

```
QuerySNSHttpEndpointAction action = QuerySNSHttpEndpointAction()
action.conditions = ["url=http://url"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QuerySNSHttpEndpointAction.Result res = action.call()
```

6.1.1.2.19 CreateSNSDingTalkEndpoint

API Request

URLs

```
POST zstack/v1/sns/application-endpoints/ding-talk
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "url": "http://dingding-robot-url",
    "atAll": false,
    "secret": "SECca7c224f47ab16fbe51050ae0b8ebfc505b2b866fc0eb3768c8d79527d1bacc0",
    "atPersonPhoneNumbers": [
      "18900002222",
      "13377778888"
    ],
    "atPersonList": {
      "13377778888": "jack"
    },
    "name": "dinding"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"url":"http://dingding-robot-
url","atAll":false,"secret":"SECca7c224f47ab16fbe51050ae0b8ebfc505b2b866fc0eb3768
["18900002222","13377778888"],"atPersonList":
{"13377778888":"jack"},"name":"dinding"}}' \
http://localhost:8080/zstack/v1/sns/application-endpoints/ding-talk
```

Request Parameters

Name	Type	Location	Description	Options Value	Starting Version
url	String	body (contained in the params structure)	The URL of the DingTalk robot.		2.3
atAll	Boolean	body (contained in the params structure)	Optional. Whether to notify all (@All) members in a DingTalk group.		2.3
atPersonPhoneNumbers	List	body (contained in the params structure)	Optional. The phone number of the group member to be notified (the @ member).		2.3
name	String	body (contained in the params structure)	The resource name.		2.3
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		2.3
resourceUuid	String	body (contained in	Optional.		2.3

Name	Type	Location	Description	Options Value	Starting Version
		the params structure)			
systemTags	List	body	Optional. The system tags.		2.3
userTags	List	body	Optional. The user tags.		2.3
platformUuid	String	body (contained in the params structure)	Optional. The notification platform.		5.0.0
tagUuids	List	body (contained in the params structure)	Optional. The tag uuid list.		5.0.0
secret	String	body (contained in the params structure)	Optional. The DingTalk secret key.		5.0.0
atPersonList	Map	body (contained in the params structure)	Optional. The @person information. (Recommend)		5.0.0

API Response

Sample Response

```
{
  "inventory": {
    "url": "http://dingding-url",
    "atAll": false,

http://localhost:8080/zstack/v1/sns/application-endpoints/ding-talk/test-connection
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
testMsg	String	body (contained in the params structure)	Testing message text.		5.0.0
endpointUuid	String	body (contained in the params structure)	Optional. DingTalk endpoint uuid.		5.0.0
systemTags	List	body	Optional. The system tag.		5.0.0
userTags	List	body	Optional. The user tag.		5.0.0
url	String	body (contained in the params structure)	Optional. The webhook url.		5.0.0
atAll	Boolean	body (contained in the params structure)	Optional. Whether @all or not.		5.0.0
atPersonPhoneNumbers	List	body (contained in the params structure)	Optional. @ person phone number.		5.0.0
secret	String	body (contained in the params structure)	Optional. The DingTalk secret key.		5.0.0

API Response

Sample Response

```
{
  "connected": true,
  "webhookResp": {}
}
```

}

Name	Type	Description	Starting Version
success	boolean		5.0.0
connected	boolean	The webhook url connectivity id. (connectivity only)	5.0.0
webhookResp	LinkedHashMap	Webhook url sends a test message to the other end of the return. (https://open.dingtalk.com/document/robots/custom-robot-access#title-7ur-3ok-s1a)	5.0.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	5.0.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	5.0.0
description	String	The brief description of the error.	5.0.0
details	String	The details about the error.	5.0.0
elaboration	String	The reserved field. Default value: null.	5.0.0
opaque	LinkedHashMap	The reserved field. Default value: null.	5.0.0
cause	ErrorCode	The root error, which is the associated root cause of the current	5.0.0

Name	Type	Description	Starting Version
		error. If no root error exists, this parameter is null.	

SDK Sample

Java SDK

```
SNSDingTalkTestConnectionAction action = new SNSDingTalkTestConnectionAction();
action.url = "https://open.feishu.cn/open-apis/bot/v2/hook/006879a3-0898-4428-aad4-3221db3daf81";
action.atAll = true;

SNSDingTalkTestConnectionAction.Result res = action.call()
```

6.1.1.2.22 RemoveSNSDingTalkAtPerson

API Request

URLs

```
DELETE zstack/v1/sns/application-endpoints/ding-talk/{endpointUuid}/at-persons/{phoneNumber}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
```

```
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/sns/application-endpoints/
ding-talk/696e69a1023f323ca147be82ed7f13cd/at-persons/18988887777?
```

Request Parameters

Name	Type	Location	Description	Optional Version	Starting Version
deleteMode	String	body	Optional.		5.0.0
systemTags	List	body	Optional. The system tags.		2.3
userTags	List	body	Optional. The user tags.		2.3
endpointUuid	String	url	The UUID of the DingTalk endpoint.		2.3
phoneNumber	String	url	The phone number of the user to be removed.		2.3

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
RemoveSNSDingTalkAtPersonAction action = new RemoveSNSDingTalkAtP
ersonAction();
action.endpointUuid = "696e69a1023f323ca147be82ed7f13cd";
action.phoneNumber = "18988887777";
action.deleteMode = "Permissive";

6.1.1.2.23 UpdateAtPersonOfAtDingTalkEndpoint

API Request

URLs

```
PUT zstack/v1/sns/application-endpoints/ding-talk/at-persons/{uuid}/
actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateAtPersonOfAtDingTalkEndpoint": {
    "endpointUuid": "d7be4980da0a308380b761afd3f36687",
    "phoneNumber": "13062689903",
    "remark": "jack"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateAtPersonOfAtDingTalkEndpoint":
{"endpointUuid":"d7be4980da0a308380b761afd3f36687","phoneNumber":"13062689903","r
\
http://localhost:8080/zstack/v1/sns/application-endpoints/ding-talk/
at-persons/c42464333dce35db9fbc8816f22b1d31/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		5.0.0
endpointUuid	String	body (contained in the updateAtPersonOfAtDingTalkEndpoint structure)	The DingTalk endpoint uuid.		5.0.0
phoneNumber	String	body (contained in the updateAtPersonOfAtDingTalkEndpoint structure)	Optional. The phone number.		5.0.0
systemTags	List	body	Optional. The system tags.		5.0.0
userTags	List	body	Optional. The user tags.		5.0.0
remark	String	body (contained in the updateAtPersonOfAtDingTalkEndpoint structure)	Optional. The remark.		5.0.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "bb8f58cf82bd42a0902e192a920e02be",
    "phoneNumber": "18988887777",

SDK Sample

Java SDK

```
QuerySNSDingTalkAtPersonAction action = new QuerySNSDingTalkAtPersonAction();
action.conditions = asList("uuid=3806b82167a33673b5067831090f317d", "endpointUuid=c36e1b34d3e73db7a53e067da95de3d5");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QuerySNSDingTalkAtPersonAction.Result res = action.call();
```

Python SDK

```
QuerySNSDingTalkAtPersonAction action = QuerySNSDingTalkAtPersonAction()
action.conditions = ["uuid=b836d745aa623217838bc9d0ecb3bb1f", "endpointUuid=dc9f00eecd1837e484bde65bf53f45a1"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QuerySNSDingTalkAtPersonAction.Result res = action.call()
```

6.1.1.2.26 QuerySNSDingTalkEndpoint

API Request

URLs

```
GET zstack/v1/sns/application-endpoints/ding-talk
GET zstack/v1/sns/application-endpoints/ding-talk/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/sns/application-endpoints/ding-talk?q=url=http://dingding-url
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/sns/application-endpoints/ding-talk/69658f91a1f130e0986fbfb19de1b3c9
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QuerySNSDingTalkEndpoint`, and pressing the **Tab** key.

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
QuerySNSDingTalkEndpointAction action = new QuerySNSDingTalkEndpointAction();
action.conditions = asList("url=http://dingding-url");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QuerySNSDingTalkEndpointAction.Result res = action.call();
```

Python SDK

```
QuerySNSDingTalkEndpointAction action = QuerySNSDingTalkEndpointAction()
action.conditions = ["url=http://dingding-url"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QuerySNSDingTalkEndpointAction.Result res = action.call()
```

6.1.1.2.27 AddSNSFeiShuAtPerson

```

Request Parameters

Name	Type	Location	Description	Options Value	Starting Version
url	String	body (contained in the params structure)	The webhook URL of the FeiShu robot.		5.0.0
atAll	Boolean	body (contained in the params structure)	Optional. Whether to notify all (@All) members in a FeiShu group.		5.0.0
atPersonUsersId	List	body (contained in the params structure)	Optional. The user id of the group member to be notified (the @member).		5.0.0
name	String	body (contained in the params structure)	The resource name.		5.0.0
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		5.0.0
platformUuid	String	body (contained in the params structure)	The notification platform uuid.		5.0.0
resourceUuid	String	body (contained in the params structure)	Optional. The resource uuid.		5.0.0
systemTags	List	body	Optional. The system tags.		5.0.0
userTags	List	body	Optional. The user tags.		5.0.0

Name	Type	Location	Description	Options Value	Starting Version
tagUuids	List	body (contained in the params structure)	Optional. The tag uuid list.		5.0.0
secret	String	body (contained in the params structure)	Optional. The FeiShu secret key.		5.0.0
atPersonList	Map	body (contained in the params structure)	Optional. The @person information. (Recommend)		5.0.0

API Response

Sample Response

```

Name	Type	Description	Starting Version
success	boolean		5.0.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	5.0.0
inventory	SNSFeiShuEndpointInventory	See inventory	5.0.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	5.0.0
description	String	The brief description of the error.	5.0.0
details	String	The details about the error.	5.0.0
elaboration	String	The reserved field. Default value: null.	5.0.0
opaque	LinkedHashMap	The reserved field. Default value: null.	5.0.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	5.0.0

#inventory

Name	Type	Description	Starting Version
url	String	The URL of the DingTalk robot.	5.0.0
atAll	boolean	Whether to notify all (@All) members in a DingTalk group.	5.0.0
secret	String	The DingTalk secret key.	5.0.0
atPersonUserIds	List	The user id of the group member to be notified (the @member).	5.0.0
name	String	The resource name.	5.0.0
uuid	String	The resource UUID.	5.0.0

Name	Type	Description	Starting Version
description	String	The detailed description of the resource.	5.0.0
type	String	The endpoint type.	5.0.0
state	String	The application platform.	5.0.0
platformUuid	String	The application platform UUID.	5.0.0
createDate	Timestamp	The creation date.	5.0.0
lastOpDate	Timestamp	The last operation date.	5.0.0
platform	SNSApplicationPlatformInventory	See platform .	5.0.0

platform

Name	Type	Description	Starting Version
uuid	String	The resource uuid.	5.0.0
name	String	The resource name.	5.0.0
description	String	The detailed description of the resource.	5.0.0
type	String	The resource type.	5.0.0
createDate	Timestamp	The creation date.	5.0.0
lastOpDate	Timestamp	The last operation date.	5.0.0

SDK Sample

Java SDK

```

CreateSNSFeiShuEndpoint action = new CreateSNSFeiShuEndpoint();

```

6.1.1.2.29 SNSFeiShuTestConnection

API Request

URLs

```
POST zstack/v1/sns/application-endpoints/feishu/test-connection
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "url": "https://open.feishu.cn/open-apis/bot/v2/hook/006879a3-0898-4428-aad4-3221db3daf81",
    "atAll": true,
    "atPersonUserIds": [
      "13062689903",
      "13062689901"
    ],
    "secret": "fiSmveXkeD2jIjrENHYjQd",
    "testMsg": "hello world",
    "endpointUuid": "1c201c27a81740ddadbc5d2f3f38a5e4"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json; charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X POST -d '{"params":{"url":"https://open.feishu.cn/open-apis/bot/v2/hook/006879a3-0898-4428-aad4-3221db3daf81","atAll":true,"atPersonUserIds":["13062689903","13062689901"],"secret":"fiSmveXkeD2jIjrENHYjQd","testMsg":"hello world","endpointUuid":"1c201c27a81740ddadbc5d2f3f38a5e4"}}' \
http://localhost:8080/zstack/v1/sns/application-endpoints/feishu/test-connection
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
testMsg	String	body (contained in the params structure)	Testing message text.		5.0.0
endpointUuid	String	body (contained in the params structure)	Optional. The FeiShu endpoint uuid.		5.0.0
systemTags	List	body	Optional. The system tag.		5.0.0
userTags	List	body	Optional. The user tag.		5.0.0
url	String	body (contained in the params structure)	Optional. The webhook url.		5.0.0
atAll	Boolean	body (contained in the params structure)	Optional. Whether @all or not.		5.0.0
atPersonUserIds	List	body (contained in the params structure)	Optional. @ person user ID.		5.0.0
secret	String	body (contained in the params structure)	Optional. The FeiShu secret key.		5.0.0

API Response

Sample Response

```
{
  "connected": true,
  "webhookResp": {}
}
```

Name	Type	Description	Starting Version
success	boolean		5.0.0
connected	boolean	The webhook url connectivity id. (connectivity only)	5.0.0
webhookResp	LinkedHashMap	Webhook url sends a test message to the other end of the return. (https://open.feishu.cn/document/client-docs/bot-v3/add-custom-bot#e2f7069c)	5.0.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	5.0.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	5.0.0
description	String	The brief description of the error.	5.0.0
details	String	The details about the error.	5.0.0

Name	Type	Description	Starting Version
elaboration	String	The reserved field. Default value: null.	5.0.0
opaque	LinkedHashMap	The reserved field. Default value: null.	5.0.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	5.0.0

SDK Sample

Java SDK

```
SNSFeiShuTestConnectionAction action = new SNSFeiShuTestConnectionAction();
action.url = "https://open.feishu.cn/open-apis/bot/v2/hook/006879a3-0898-4428-aad4-3221db3daf81";
action.atAll = true;
action.atPersonUserIds = asList("13062689903", "13062689901");
action.secret = "fiSmveXkeD2jIjrENHYjQd";
action.testMsg = "hello world";
action.endpointUuid = "1c201c27a81740ddadbc5d2f3f38a5e4";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
SNSFeiShuTestConnectionAction.Result res = action.call();
```

Python SDK

```
SNSFeiShuTestConnectionAction action = SNSFeiShuTestConnectionAction()
action.url = "https://open.feishu.cn/open-apis/bot/v2/hook/006879a3-0898-4428-aad4-3221db3daf81"
action.atAll = true
action.atPersonUserIds = [13062689903, 13062689901]
action.secret = "fiSmveXkeD2jIjrENHYjQd"
action.testMsg = "hello world"
action.endpointUuid = "1c201c27a81740ddadbc5d2f3f38a5e4"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
SNSFeiShuTestConnectionAction.Result res = action.call()
```

6.1.1.2.30 RemoveSNSFeiShuAtPerson

API Request

URLs

```
DELETE zstack/v1/sns/application-endpoints/feishu/{endpointUuid}/at-
persons/{userId}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/sns/application-endpoints/
feishu/43241429944f37a1b1c9470d8c2f3e1c/at-persons/18988887777?
```

Request Parameters

Name	Type	Location	Description	Optional Version	Starting Version
endpointUuid	String	url	The FeiShu Endpoint uuid.		5.0.0
userId	String	url	The FeiShu user Id.		5.0.0
deleteMode	String	body	Optional. Delete mode(Permissive / Enforcing, Permissive)		5.0.0
systemTags	List	body	Optional. The system tag.		5.0.0
userTags	List	body	Optional. The user tag.		5.0.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
RemoveSNSFeiShuAtPersonAction action = new RemoveSNSFeiShuAtPer
sonAction();
action.endpointUuid = "43241429944f37a1b1c9470d8c2f3e1c";
action.userId = "18988887777";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
RemoveSNSFeiShuAtPersonAction.Result res = action.call();
```

Python SDK

```
RemoveSNSFeiShuAtPersonAction action = RemoveSNSFeiShuAtPersonAction()
action.endpointUuid = "43241429944f37a1b1c9470d8c2f3e1c"
action.userId = "18988887777"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
RemoveSNSFeiShuAtPersonAction.Result res = action.call()
```

6.1.1.2.31 UpdateAtPersonOfAtFeiShuEndpoint

API Request

URLs

```
PUT zstack/v1/sns/application-endpoints/feishu/at-persons/{uuid}/
actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateAtPersonOfAtFeiShuEndpoint": {
    "endpointUuid": "60274b11ffdc3ea080be205b964848d2",
    "userId": "zhang.san",
    "remark": "jack"
  }
}
```

```

    },
    "systemTags": [],
    "userTags": []
  }

```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateAtPersonOfAtFeiShuEndpoint":

```
QuerySNSFeiShuAtPersonAction action = new QuerySNSFeiShuAtPersonAction();
action.conditions = asList("uuid=3c1da61415ec3311a18e7ff94f488fc9", "endpointUuid=5ceba2786e113cf5ae1af0f95ff3623c");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QuerySNSFeiShuAtPersonAction.Result res = action.call();
```

Python SDK

```
QuerySNSFeiShuAtPersonAction action = QuerySNSFeiShuAtPersonAction()
action.conditions = ["uuid=c309bdc1cb213847aa4be3d57b4b2d55", "endpointUuid=8b95394f0d55320085f44175ee0d116f"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QuerySNSFeiShuAtPersonAction.Result res = action.call()
```

6.1.1.2.34 CreateSNSHttpEndpoint

API Request

URLs

```
POST zstack/v1/sns/application-endpoints/http
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "url": "http://127.0.0.1:6666/test-url",
    "username": "username",
    "password": "password",
    "name": "http"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"url":"http://127.0.0.1:6666/test-url","username":"username","password":"password","name":"http"}}' \
http://localhost:8080/zstack/v1/sns/application-endpoints/http
```

Request Parameters

Name	Type	Location	Description	Options Value	Starting Version
url	String	body (contained in the params structure)	The webhook URL of the FeiShu robot.		5.0.0
username	String	body (contained in the params structure)	Optional. The user name.		5.0.0
password	String	body (contained in the params structure)	Optional. The password.		5.0.0
name	String	body (contained in the params structure)	The resource name.		5.0.0
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		5.0.0
platformUuid	String	body (contained in the params structure)	The notificatiin platform uuid.		5.0.0
resourceUuid	String	body (contained in	Optional. The resource uuid.		5.0.0

Name	Type	Location	Description	Options Value	Starting Version
		the params structure)			
systemTags	List	body	Optional. The system tags.		5.0.0
userTags	List	body	Optional. The user tags.		5.0.0
tagUuids	List	body (contained in the params structure)	Optional. The tag uuid list.		5.0.0

API Response

Sample Response

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
CreateSNSHttpEndpointAction action = new CreateSNSHttpEndpointAction();
action.url = "http://127.0.0.1:6666/test-url";
action.username = "username";
action.password = "password";
action.name = "http";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateSNSHttpEndpointAction.Result res = action.call();
```

Python SDK

```
CreateSNSHttpEndpointAction action = CreateSNSHttpEndpointAction()
action.url = "http://127.0.0.1:6666/test-url"
action.username = "username"
action.password = "password"
action.name = "http"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
CreateSNSHttpEndpointAction.Result res = action.call()
```

6.1.1.2.35 UpdateSNSHttpEndpoint

API Request

URLs

```
PUT zstack/v1/sns/application-endpoints/http/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateSNSHttpEndpoint": {
    "url": "https://open.http.cn/open-apis/bot/v2/hook/006879a3-0898-4428-aad4-3221db3daf81",
    "username": "admin",
    "password": "password",
    "name": "new name",
    "description": "desc"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateSNSHttpEndpoint":{"url":"https://open.http.cn/open-apis/bot/v2/hook/006879a3-0898-4428-aad4-3221db3daf81","username":"admin","password":"password","name":"new name","description":"desc"}}' \
http://localhost:8080/zstack/v1/sns/application-endpoints/http/c051c930bd95394c9cd6b3775f8cb475/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
url	String	body (contained)	Optional. The webhook url.		5.0.0

Name	Type	Location	Description	Optional Value	Starting Version
		in the updateSNSH ttpEndpoint structure)			
username	Boolean	body (contained in the updateSNSH ttpEndpoint structure)	Optional. The username.		5.0.0
password	String	body (contained in the updateSNSH ttpEndpoint structure)	Optional. The password.		5.0.0
uuid	String	url	The resource uuid.		5.0.0
name	String	body (contained in the updateSNSH ttpEndpoint structure)	Optional. The resource name.		5.0.0
description	String	body (contained in the updateSNSH ttpEndpoint structure)	Optional. The detailed description of resource.		5.0.0
systemTags	List	body	Optional. The system tag.		5.0.0
userTags	List	body	Optional. The user tag.		5.0.0

API Response

Sample Response

```
{
  "inventory": {
    "name": "example",
    "uuid": "917fe66f76b241f0843dfbd6be685fc1",
    "description": "description example",
    "type": "Email",
    "state": "Enabled",
    "platformUuid": "4eb0ceebf95b452585ebeacd647d9f35",
    "createDate": "Dec 25, 2023 2:08:22 PM",
    "lastOpDate": "Dec 25, 2023 2:08:22 PM"
  }
}
```

Name	Type	Description	Starting Version
success	boolean		5.0.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	5.0.0
inventory	SNSApplicationEndpointInventory	See inventory .	5.0.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	5.0.0
description	String	The brief description of the error.	5.0.0
details	String	The details about the error.	5.0.0
elaboration	String	The reserved field. Default value: null.	5.0.0
opaque	LinkedHashMap	The reserved field. Default value: null.	5.0.0

Name	Type	Description	Starting Version
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	5.0.0

#inventory

Name	Type	Description	Starting Version
name	String	The resource name.	5.0.0
uuid	String	The resource UUID.	5.0.0
description	String	The detailed description of the resource.	5.0.0
type	String	The type.	5.0.0
platformUuid	String	The application platform UUID.	5.0.0
createDate	Timestamp	The creation date.	5.0.0
lastOpDate	Timestamp	The last operation date.	5.0.0

SDK Sample

Java SDK

```
UpdateSNSHttpEndpointAction action = new UpdateSNSHttpEndpointAction
();
action.url = "https://open.http.cn/open-apis/bot/v2/hook/006879a3-0898
-4428-aad4-3221db3daf81";
action.username = "admin";
action.password = "password";
action.uuid = "c051c930bd95394c9cd6b3775f8cb475";
action.name = "new name";
action.description = "desc";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateSNSHttpEndpointAction.Result res = action.call();
```

Python SDK

```
UpdateSNSHttpEndpointAction action = UpdateSNSHttpEndpointAction()
action.url = "https://open.http.cn/open-apis/bot/v2/hook/006879a3-0898
-4428-aad4-3221db3daf81"
action.username = "admin"
action.password = "password"
action.uuid = "c051c930bd95394c9cd6b3775f8cb475"
```

```

action.name = "new name"
action.description = "desc"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateSNSHttpEndpointAction.Result res = action.call()

```

6.1.1.2.36 QuerySNSHttpEndpoint

API Request

URLs

```

GET zstack/v1/sns/application-endpoints/http
GET zstack/v1/sns/application-endpoints/http/{uuid}

```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/sns/application-endpoints/http?
q=url=http://url

```

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/sns/application-endpoints/http/
cbd9163bb4683e10b8a5025621e36862

```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QuerySNSHttpEndpoint`, and pressing the **Tab** key.

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```

{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}

```

SDK Sample

Java SDK

```
QuerySNSHttpEndpointAction action = new QuerySNSHttpEndpointAction();
```

```
action.conditions = asList("url=http://url");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QuerySNSHttpEndpointAction.Result res = action.call();
```

Python SDK

```
QuerySNSHttpEndpointAction action = QuerySNSHttpEndpointAction()
action.conditions = ["url=http://url"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QuerySNSHttpEndpointAction.Result res = action.call()
```

6.1.1.2.37 DeleteSNSApplicationEndpoint

API Request

URLs

```
DELETE zstack/v1/sns/application-endpoints/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/sns/application-endpoints/
f068da2f92f7354cbc9054a6c14989ea
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.3
deleteMode	String	body	Optional.		2.3
systemTags	List	body	Optional. The system tags.		2.3
userTags	List	body	Optional. The user tags.		2.3

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteSNSApplicationEndpointAction action = new DeleteSNSApplication
EndpointAction();
action.uuid = "f068da2f92f7354cbc9054a6c14989ea";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteSNSApplicationEndpointAction.Result res = action.call();
```

Python SDK

```
DeleteSNSApplicationEndpointAction action = DeleteSNSApplication
EndpointAction()
action.uuid = "f068da2f92f7354cbc9054a6c14989ea"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteSNSApplicationEndpointAction.Result res = action.call()
```

6.1.1.2.38 UpdateSNSApplicationEndpoint

API Request

URLs

```
PUT zstack/v1/sns/application-endpoints/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateSNSApplicationEndpoint": {
    "name": "new name"
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateSNSApplicationEndpoint":{"name":"new name"}}' \
http://localhost:8080/zstack/v1/sns/application-
endpoints/7d6155384f4e3cdaa6e877ecec59318c/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.3
name	String	body (contained in the updateSNSApplicationEndpoint structure)	Optional. The resource name.		2.3
description	String	body (contained in the updateSNSApplicationEndpoint structure)	Optional. The detailed description of the resource.		2.3
systemTags	List	body	Optional. The system tags.		2.3
userTags	List	body	Optional. The user tags.		2.3

API Response

Sample Response

```
{
  "inventory": {
    "name": "example",
    "uuid": "917fe66f76b241f0843dfbd6be685fc1",

-X GET http://localhost:8080/zstack/v1/sns/application-endpoints/
b8a4be12db8237a1a42f897402afd4e8
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QuerySNSApplicationEndpoint**, and pressing the **Tab** key.

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
QuerySNSApplicationEndpointAction action = new QuerySNSApplicationE
ndpointAction();
action.conditions = asList("name=http");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
QuerySNSApplicationEndpointAction.Result res = action.call();
```

Python SDK

```
QuerySNSApplicationEndpointAction action = QuerySNSApplicationE
ndpointAction()
action.conditions = ["name=http"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QuerySNSApplicationEndpointAction.Result res = action.call()
```

6.1.1.2.40 ChangeSNSApplicationEndpointState

API Request

URLs

```
PUT zstack/v1/sns/application-endpoints/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeSNSApplicationEndpointState": {
    "stateEvent": "disable"
  },
  "systemTags": [],
  "userTags": []
}
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"changeSNSApplicationEndpointState":
{"stateEvent":"disable"}}' \
http://localhost:8080/zstack/v1/sns/application-
endpoints/1485ef44ea5234ee83d80d3a15937e19/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.3
stateEvent	String	body (contained in the	The state event.	- enable - disable	2.3

Name	Type	Location	Description	Optional Value	Starting Version
		changeSNSApplicationEndpointState structure)			
systemTags	List	body	Optional. The system tags.		2.3
userTags	List	body	Optional. The user tags.		2.3

API Response

Sample Response

```
{
  "inventory": {
    "name": "example",
    "uuid": "917fe66f76b241f0843dfbd6be685fc1",

    "lastOpDate": "Dec 25, 2023 2:06:05 PM"
  }
}
```

Name	Type	Description	Starting Version
success	boolean		5.0.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventory	SNSApplicationEndpointInventory	See inventory .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code	0.6

Name	Type	Description	Starting Version
		that specifies an error . For example, SYS.1000, HOST.1001.	
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	2.3
name	String	The resource name.	2.3
description	String	The detailed description of the resource.	2.3
type	String	The type.	2.3
platformUuid	String	The application platform UUID.	2.3
lastOpDate	Timestamp	The last operation date.	2.3
createDate	Timestamp	The creation date.	2.3

SDK Sample

Java SDK

```
ChangeSNSApplicationEndpointStateAction action = new ChangeSNSApplicationEndpointStateAction();
```

```
action.uuid = "1485ef44ea5234ee83d80d3a15937e19";
action.stateEvent = "disable";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
ChangeSNSApplicationEndpointStateAction.Result res = action.call();
```

Python SDK

```
ChangeSNSApplicationEndpointStateAction action = ChangeSNSApplication
EndpointStateAction()
action.uuid = "1485ef44ea5234ee83d80d3a15937e19"
action.stateEvent = "disable"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
ChangeSNSApplicationEndpointStateAction.Result res = action.call()
```

6.1.1.2.41 CreateSNSAliyunSmsEndpoint

API Request

URLs

```
POST zstack/v1/sns/sms-endpoints/aliyunsms
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "accessKeyUuid": "4eb00e2bf95bp5s505e6eccd647d9k35",
    "receivers": [
      "1355555555",
      "1866666666"
    ],
    "name": "AliyunSms",
    "description": "This is an Aliyun SMS Endpoint"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"accessKeyUuid":"4eb00e2bf95bp5s505e6eccd647d9k35","receivers":
["1355555555","1866666666"],"name":"AliyunSms","description":"This
```

```
is an Aliyun SMS Endpoint"}}' http://localhost:8080/zstack/v1/sns/
sms-endpoints/aliyunsms
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
accessKeyU uid	String	body (contained in the params structure)	The UUID of the Aliyun access key.		3.7.0
receivers	List	body (contained in the params structure)	Optional. The SMS message receivers.		3.7.0
name	String	body (contained in the params structure)	The endpoint name.		3.7.0
description	String	body (contained in the params structure)	Optional. The detailed description of the endpoint.		3.7.0
platformUuid	String	body (contained in the params structure)	Optional.		3.7.0
resourceUuid	String	body (contained in the params structure)	Optional.		3.7.0
tagUuids	List	body (contained in the params structure)	The tag UUID list.		3.7.0
systemTags	List	body	Optional. The system tags.		3.7.0
userTags	List	body	Optional. The user tags.		3.7.0

API Response

Sample Response

```
{

success	boolean		5.0.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.7.0
inventory	SNSSmsEndpointInventory	See inventory .	3.7.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6

Name	Type	Description	Starting Version
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventory

Name	Type	Description	Starting Version
receivers	List	The SMS message receivers.	3.7.0
name	String	The name of the SMS message endpoint.	3.7.0
uuid	String	The UUID of the SMS message endpoint.	3.7.0
description	String	The detailed description of the SMS message endpoint.	3.7.0
type	String	The type of the SMS message endpoint.	3.7.0
state	String	The state of the SMS message endpoint.	3.7.0
platformUuid	String		3.7.0
createDate	Timestamp	The creation date.	3.7.0
lastOpDate	Timestamp	The last operation date.	3.7.0

SDK Sample

Java SDK

```
CreateSNSAliyunSmsEndpointAction action = new CreateSNSAliyunSmsEndpointAction();
action.accessKeyUuid = "4eb00e2bf95bp5s505e6eccd647d9k35";
action.receivers = asList("13555555555", "18666666666");
action.name = "AliyunSms";
action.description = "This is an Aliyun SMS Endpoint";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
CreateSNSAliyunSmsEndpointAction.Result res = action.call();
```

Python SDK

```
CreateSNSAliyunSmsEndpointAction action = CreateSNSAliyunSmsEn
dpointAction()
action.accessKeyUuid = "4eb00e2bf95bp5s505e6eccd647d9k35"
action.receivers = [13555555555, 18666666666]
action.name = "AliyunSms"
action.description = "This is an Aliyun SMS Endpoint"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CreateSNSAliyunSmsEndpointAction.Result res = action.call()
```

6.1.1.2.42 ValidateSNSAliyunSmsEndpoint

API Request

URLs

```
PUT zstack/v1/sns/sms-endpoints/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "validateSNSAliyunSmsEndpoint": {
    "phoneNumbers": [
      "134567898765",
      "18654321234"
    ]
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"validateSNSAliyunSmsEndpoint":{"phoneNumbers":
["134567898765","18654321234"]}}' http://localhost:8080/zstack/v1/sns/
sms-endpoints/56304854f10730adac30a81c1e8e8de4/actions
```

Request Parameters

Name	Type	Location	Description	Options Value	Starting Version
uuid	String	url	The endpoint UUID.		3.7.0
phoneNumbers	List	body (contained in the validateSNSAliyunSmsEndpoint structure)	The phone numbers to receive SMS verification messages.		3.7.0
systemTags	List	body	Optional. The system tags.		3.7.0
userTags	List	body	Optional. The user tags.		3.7.0

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
ValidateSNSAliyunSmsEndpointAction action = new ValidateSNSAliyunSmsEndpointAction();
action.uuid = "56304854f10730adac30a81c1e8e8de4";
action.phoneNumbers = asList("134567898765", "18654321234");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
ValidateSNSAliyunSmsEndpointAction.Result res = action.call();
```

Python SDK

```
ValidateSNSAliyunSmsEndpointAction action = ValidateSNSAliyunSmsEndpointAction()
action.uuid = "56304854f10730adac30a81c1e8e8de4"
action.phoneNumbers = [134567898765, 18654321234]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
ValidateSNSAliyunSmsEndpointAction.Result res = action.call()
```

6.1.1.2.43 CreateSNSUniversalSmsEndpoint

API Request

URLs

```
POST zstack/v1/sns/application-endpoints/universal-sms
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "smsAccessKeyId": "smsAccessKeyId",
    "smsAccessKeySecret": "smsAccessKeySecret",

6.1.1.2.45 ValidateSNSUniversalSmsEndpoint

API Request

URLs

```
PUT zstack/v1/sns/application-endpoints/universal-sms/{uuid}/validate
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "validateSNSUniversalSmsEndpoint": {
    "testMsg": "test sms",
    "phoneNumbers": [
      "134567898765",
      "18654321234"
    ]
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"validateSNSUniversalSmsEndpoint":{"testMsg":"test
sms","phoneNumbers":["134567898765","18654321234"]}}' http://
localhost:8080/zstack/v1/sns/application-endpoints/universal-sms/
b762d45d18943f16abac61b600874b09/validate
```

Request Parameters

Name	Type	Location	Description	Valid Values	Starting Version
testMsg	String	body (contained in the validateSN			5.1.8

Name	Type	Location	Description	Valid Values	Starting Version
		SUniversalSmsEndpoint structure).			
uuid	String	url	The resource UUID.		5.1.8
phoneNumbers	List	body (contained in the validateSN SUniversalSmsEndpoint structure).			5.1.8
systemTags	List	body	Optional. The system tags.		5.1.8
userTags	List	body	Optional. The user tags.		5.1.8

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
ValidateSNSUniversalSmsEndpointAction action = new ValidateSNSUniversalSmsEndpointAction();
action.testMsg = "test sms";
action.uuid = "b762d45d18943f16abac61b600874b09";
action.phoneNumbers = asList("134567898765", "18654321234");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
ValidateSNSUniversalSmsEndpointAction.Result res = action.call();
```

Python SDK

```
ValidateSNSUniversalSmsEndpointAction action = ValidateSNSUniversalSmsEndpointAction()
action.testMsg = "test sms"
action.uuid = "b762d45d18943f16abac61b600874b09"
action.phoneNumbers = [134567898765, 18654321234]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
ValidateSNSUniversalSmsEndpointAction.Result res = action.call()
```

6.1.1.2.46 QuerySNSUniversalSmsEndpoint

API Request

URLs

```
GET zstack/v1/sns/application-endpoints/universal-sms
```

```
GET zstack/v1/sns/application-endpoints/universal-sms/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/sns/application-endpoints/universal-sms?q=url=http://universal-sms-url
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/sns/application-endpoints/universal-sms/004b6a5c2ad13e3eaf53db006d47eaf2
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QuerySNSUniversalSmsEndpoint`, and pressing the **Tab** key.

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
  }
}
```

```

    "details": "Create VM on KVM timeout after 300s"
  }
}

```

SDK Sample

Java SDK

```

QuerySNSUniversalSmsEndpointAction action = new QuerySNSUniversalSms
EndpointAction();
action.conditions = asList("url=http://universal-sms-url");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QuerySNSUniversalSmsEndpointAction.Result res = action.call();

```

Python SDK

```

QuerySNSUniversalSmsEndpointAction action = QuerySNSUniversalSms
EndpointAction()
action.conditions = ["url=http://universal-sms-url"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QuerySNSUniversalSmsEndpointAction.Result res = action.call()

```

phoneNumber	String	The phone number to receive SMS messages.	3.7.0
endpointUuid	String	The UUID of the SMS message endpoint.	3.7.0
description	String	The description of the SMS message receiver.	3.7.0
createDate	Timestamp	The creation date.	3.7.0
lastOpDate	Timestamp	The last operation date.	3.7.0
type	SmsReceiverType	See type .	3.7.0

#type

Name	Type	Description	Starting Version
AliyunSms	SmsReceiverType	The Aliyun SMS message.	3.7.0
UniversalSms	SmsReceiverType	The universal SMS message.	5.1.8

SDK Sample

Java SDK

```
AddSNSSmsReceiverAction action = new AddSNSSmsReceiverAction();
action.phoneNumber = "13333333333";
action.phoneNumberList = asList("13333333333");
action.endpointUuid = "467e77c4cc42492f9794429e689a9874";
action.type = "AliyunSms";
action.description = "description";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
AddSNSSmsReceiverAction.Result res = action.call();
```

Python SDK

```
AddSNSSmsReceiverAction action = AddSNSSmsReceiverAction()
action.phoneNumber = "13333333333"
action.phoneNumberList = [13333333333]
action.endpointUuid = "467e77c4cc42492f9794429e689a9874"
action.type = "AliyunSms"
action.description = "description"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
AddSNSSmsReceiverAction.Result res = action.call()
```

6.1.1.2.48 RemoveSNSSmsReceiver

API Request

URLs

```
DELETE zstack/v1/sns/sms-endpoints/{endpointUuid}/receivers/
{phoneNumber}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/sns/sms-
endpoints/196b91815e983d1397cb336a4fc9d054/receivers/13333333333
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
endpointUuid	String	url	The UUID of the SMS endpoint.		3.7.0
phoneNumber	String	url	Optional. The phone number to receive SMS messages.		3.7.0
phoneNumberList	List	body	Optional. The list of phone numbers to receive SMS messages.		5.1.8
deleteMode	String	body	Optional.		3.7.0
systemTags	List	body	Optional. The system tags.		3.7.0
userTags	List	body	Optional. The user tags.		3.7.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
RemoveSNSSmsReceiverAction action = new RemoveSNSSmsReceiverAction();
action.endpointUuid = "196b91815e983d1397cb336a4fc9d054";
action.phoneNumber = "13333333333";
action.phoneNumberList = asList("13333333333");
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
RemoveSNSSmsReceiverAction.Result res = action.call();
```

Python SDK

```
RemoveSNSSmsReceiverAction action = RemoveSNSSmsReceiverAction()
action.endpointUuid = "196b91815e983d1397cb336a4fc9d054"
action.phoneNumber = "13333333333"
action.phoneNumberList = [13333333333]
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
RemoveSNSSmsReceiverAction.Result res = action.call()
```

6.1.1.2.49 QuerySNSSmsEndpoint

API Request

URLs

```
GET zstack/v1/sns/sms-endpoints
GET zstack/v1/sns/sms-endpoints/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/sns/sms-endpoints?
q=name=SmsEndpoint
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/sns/sms-
endpoints/5efca3a7d67031fbba5bc512e52a4798
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QuerySNSSmsEndpoint**, and pressing the **Tab** key.

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
QuerySNSSmsEndpointAction action = new QuerySNSSmsEndpointAction();
action.conditions = asList("name=SmsEndpoint");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QuerySNSSmsEndpointAction.Result res = action.call();
```

Python SDK

```
QuerySNSSmsEndpointAction action = QuerySNSSmsEndpointAction()
action.conditions = ["name=SmsEndpoint"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QuerySNSSmsEndpointAction.Result res = action.call()
```

6.1.1.2.50 AddEmailAddressToSNSEmailEndpoint

API Request

URLs

```
POST zstack/v1/sns/application-endpoints/emails/email-addresses
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "emailAddress": "example@zstack.io",
    "endpointUuid": "74220bbf0d8b3c6b943a294c2679ca69"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"emailAddress":"example@zstack.io","endpointUuid":"74220bbf0d8b3c6b943a294c2679ca69"}}
```

```
http://localhost:8080/zstack/v1/sns/application-endpoints/emails/
email-addresses
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
emailAddress	String	body (contained in the params structure)	The email address.		3.7.0
endpointUuid	String	body (contained in the params structure)	The endpoint UUID.		3.7.0
resourceUuid	String	body (contained in the params structure)	Optional.		3.7.0
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID list.		3.7.0
systemTags	List	body	Optional. The system tags.		3.7.0
userTags	List	body	Optional. The user tags.		3.7.0

API Response

Sample Response

```

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
url	String	body (contained in	Optional. The webhook url.		5.0.0

Name	Type	Location	Description	Optional Value	Starting Version
		the params structure)			
testMsg	String	body (contained in the params structure)	Testing message text.		5.0.0
endpointUuid	String	body (contained in the params structure)	Optional. The microsoft teams endpoint uuid.		5.0.0
systemTags	List	body	Optional. The system tag.		5.0.0
userTags	List	body	Optional. The user tag.		5.0.0

API Response

Sample Response

```
{
  "connected": true,
  "webhookResp": {}
}
```

Name	Type	Description	Starting Version
success	boolean		5.0.0
connected	boolean	The webhook url connectivity id. (connectivity only)	5.0.0
webhookResp	LinkedHashMap	Webhook url sends a test message to the other end of the return.	5.0.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	5.0.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	5.0.0
description	String	The brief description of the error.	5.0.0
details	String	The details about the error.	5.0.0
elaboration	String	The reserved field. Default value: null.	5.0.0
opaque	LinkedHashMap	The reserved field. Default value: null.	5.0.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	5.0.0

SDK Sample

Java SDK

```
SNSMicrosoftTeamsTestConnectionAction action = new SNSMicroso
ftTeamsTestConnectionAction();
action.url = "https://microsoft.com/cgi-bin/webhook/send?key=f8b9014a-
207a-44d5-ae26-3501bf01dbc4";
action.testMsg = "hello";
action.endpointUuid = "1c201c27a81740ddadbc5d2f3f38a5e4";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
SNSMicrosoftTeamsTestConnectionAction.Result res = action.call();
```

Python SDK

```
SNSMicrosoftTeamsTestConnectionAction action = SNSMicrosoftTeamsTes
tConnectionAction()
action.url = "https://microsoft.com/cgi-bin/webhook/send?key=f8b9014a-
207a-44d5-ae26-3501bf01dbc4"
action.testMsg = "hello"
action.endpointUuid = "1c201c27a81740ddadbc5d2f3f38a5e4"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
SNSMicrosoftTeamsTestConnectionAction.Result res = action.call()
```

6.1.1.2.55 CreateSNSMicrosoftTeamsEndpoint

API Request

URLs

```
POST zstack/v1/sns/application-endpoints/microsoft-teams
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "url": "http://teams-robot-url",
    "name": "Microsoft teams"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"url":"http://teams-robot-url","name":"Microsoft teams"}}' http://localhost:8080/zstack/v1/sns/application-endpoints/microsoft-teams
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
url	String	body (contained in the params structure)	The connector URL.		3.10.0
name	String	body (contained in	The resource name.		3.10.0

Name	Type	Location	Description	Optional Value	Starting Version
		the params structure)			
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		3.10.0
platformUuid	String	body (contained in the params structure)	Optional. The notification platform uuid.		3.10.0
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		3.10.0
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID list.		3.10.0
systemTags	List	body	Optional. The system tags.		3.10.0
userTags	List	body	Optional. The user tags.		3.10.0

API Response

Sample Response

```
{
  "inventory": {
    "url": "http://teams-robot-url",
    "name": "example",
    "uuid": "917fe66f76b241f0843dfbd6be685fc1",
    "description": "description example",
    "type": "Email",
    "state": "Enabled",
    "platformUuid": "4eb0ceebf95b452585ebeacd647d9f35",
    "createDate": "Dec 25, 2023 2:06:32 PM",
    "lastOpDate": "Dec 25, 2023 2:06:32 PM"
  }
}
```

}

Name	Type	Description	Starting Version
success	boolean		5.0.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.10.0
inventory	SNSSmsEndpointInventory	See inventory .	3.10.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.10.0
description	String	The brief description of the error.	3.10.0
details	String	The details about the error.	3.10.0
elaboration	String	The reserved field. Default value: null.	3.10.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.10.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.10.0

#inventory

Name	Type	Description	Starting Version
url	String	The connector URL.	3.10.0
name	String	The resource name.	3.10.0
uuid	String	The resource UUID.	3.10.0
description	String	The detailed description of the resource.	3.10.0
type	String		3.10.0
state	String		3.10.0
platformUuid	String		3.10.0
createDate	Timestamp	The creation date.	3.10.0
lastOpDate	Timestamp	The last operation date.	3.10.0

SDK Sample

Java SDK

```
CreateSNSMicrosoftTeamsEndpointAction action = new CreateSNSMicrosoftTeamsEndpointAction();  
action.url = "http://teams-robot-url";  
action.name = "Microsoft teams";  
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";  
CreateSNSMicrosoftTeamsEndpointAction.Result res = action.call();
```

Python SDK

```
CreateSNSMicrosoftTeamsEndpointAction action = CreateSNSMicrosoftTeamsEndpointAction()  
action.url = "http://teams-robot-url"  
action.name = "Microsoft teams"  
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
CreateSNSMicrosoftTeamsEndpointAction.Result res = action.call()
```

6.1.1.2.56 UpdateSNSMicrosoftTeamsEndpoint

API Request

URLs

```
PUT zstack/v1/sns/application-endpoints/microsoft-teams/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateSNSMicrosoftTeamsEndpoint": {
    "url": "https://open.microsoft-teams.cn/open-apis/bot/v2/hook/006879a3-0898-4428-aad4-3221db3daf81",
    "name": "new name",
    "description": "desc"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateSNSMicrosoftTeamsEndpoint":{"url":"https://open.microsoft-teams.cn/open-apis/bot/v2/hook/006879a3-0898-4428-aad4-3221db3daf81","name":"new name","description":"desc"}}' \
http://localhost:8080/zstack/v1/sns/application-endpoints/microsoft-teams/74653e34090f3c6fbe9f45b693600dcf/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		5.0.0

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the updateSNSMicrosoftTeamsEndpoint structure)	Optional. The resource name.		5.0.0
description	String	body (contained in the updateSNSMicrosoftTeamsEndpoint structure)	Optional. The detailed description of the resource.		5.0.0
systemTags	List	body	Optional. The system tags.		5.0.0
userTags	List	body	Optional. The user tags.		5.0.0

API Response

Sample Response

```
{
  "inventory": {
    "name": "example",
    "uuid": "917fe66f76b241f0843dfbd6be685fc1",
    "description": "description example",
    "type": "Email",
    "state": "Enabled",
    "platformUuid": "4eb0ceebf95b452585ebeacd647d9f35",
    "createDate": "Dec 25, 2023 2:04:12 PM",
    "lastOpDate": "Dec 25, 2023 2:04:12 PM"
  }
}
```

Name	Type	Description	Starting Version
success	boolean		5.0.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For	5.0.0

Name	Type	Description	Starting Version
		more information, see error .	
inventory	SNSApplicationEndpointInventory	See inventory .	5.0.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	5.0.0
description	String	The brief description of the error.	5.0.0
details	String	The details about the error.	5.0.0
elaboration	String	The reserved field. Default value: null.	5.0.0
opaque	LinkedHashMap	The reserved field. Default value: null.	5.0.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	5.0.0

#inventory

Name	Type	Description	Starting Version
name	String	The resource name.	5.0.0
uuid	String	The resource UUID.	5.0.0
description	String	The detailed description of the resource.	5.0.0
type	String	The type.	5.0.0

Name	Type	Description	Starting Version
platformUuid	String	The application platform UUID.	5.0.0
createDate	Timestamp	The creation date.	5.0.0
lastOpDate	Timestamp	The last operation date.	5.0.0

SDK Sample

Java SDK

```
UpdateSNSMicrosoftTeamsEndpointAction action = new UpdateSNSM
icrosoftTeamsEndpointAction();
action.url = "https://open.microsoft-teams.cn/open-apis/bot/v2/hook/
006879a3-0898-4428-aad4-3221db3daf81";

UpdateSNSMicrosoftTeamsEndpointAction.Result res = action.call()
```

6.1.1.2.57 QuerySNSMicrosoftTeamsEndpoint

API Request

URLs

```
GET zstack/v1/sns/application-endpoints/microsoft-teams
```

```
GET zstack/v1/sns/application-endpoints/microsoft-teams/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
```

```
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \  
-X GET http://localhost:8080/zstack/v1/sns/application-endpoints/  
microsoft-teams?q=url=http://teams-url
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QuerySNSMicrosoftTeamsEndpoint**, and pressing the **Tab** key.

API Response

Sample Response

```
{  
  "error": {  
    "code": "SYS.1001",  
    "description": "A message or a operation timeout",  
    "details": "Create VM on KVM timeout after 300s"  
  }  
}
```

SDK Sample

Java SDK

```
QuerySNSMicrosoftTeamsEndpointAction action = new QuerySNSMicrosoftTea  
msEndpointAction();  
action.conditions = asList("url=http://teams-url");  
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";  
QuerySNSMicrosoftTeamsEndpointAction.Result res = action.call();
```

Python SDK

```
QuerySNSMicrosoftTeamsEndpointAction action = QuerySNSMicrosoftTea  
msEndpointAction()  
action.conditions = ["url=http://teams-url"]  
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
QuerySNSMicrosoftTeamsEndpointAction.Result res = action.call()
```

6.1.1.2.58 SubscribeNSTopic

API Request

URLs

```
POST zstack/v1/sns/topics/{topicUuid}/endpoints/{endpointUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{}}' \
http://localhost:8080/zstack/v1/sns/
topics/755ac6aea82f3365a66b86258c55189e/endpoints/
c1f5c1e23ff13001b249c18253984741
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
topicUuid	String	url	The application topic UUID.		2.3
endpointUuid	String	url	The endpoint UUID.		2.3
systemTags	List	body	Optional. The system tags.		2.3

Name	Type	Location	Description	Optional Value	Starting Version
userTags	List	body	Optional. The user tags.		2.3

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
SubscribeSNSTopicAction action = new SubscribeSNSTopicAction();
action.topicUuid = "755ac6aea82f3365a66b86258c55189e";
action.endpointUuid = "c1f5c1e23ff13001b249c18253984741";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
SubscribeSNSTopicAction.Result res = action.call();
```

Python SDK

```
SubscribeSNSTopicAction action = SubscribeSNSTopicAction()
action.topicUuid = "755ac6aea82f3365a66b86258c55189e"
action.endpointUuid = "c1f5c1e23ff13001b249c18253984741"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
SubscribeSNSTopicAction.Result res = action.call()
```

6.1.1.2.59 QuerySNSTopicSubscriber

API Request

URLs

```
GET zstack/v1/sns/topics/subscribers
```

```
GET zstack/v1/sns/topics/subscribers/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/sns/topics/subscribers?
q=topicUuid=3677dc0f00964b80886f3b2bbf9338cd
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \

endpointUuid	String	The endpoint UUID.	2.3.1
createDate	Timestamp	The creation date.	2.3.1
lastOpDate	Timestamp	The last operation date.	2.3.1

SDK Sample

Java SDK

```
QuerySNSTopicSubscriberAction action = new QuerySNSTopicSubscriberAction();
action.conditions = asList("topicUuid=3677dc0f00964b80886f3b2bbf9338cd");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
QuerySNSTopicSubscriberAction.Result res = action.call();
```

Python SDK

```
QuerySNSTopicSubscriberAction action = QuerySNSTopicSubscriberAction()
action.conditions = ["topicUuid=3677dc0f00964b80886f3b2bbf9338cd"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QuerySNSTopicSubscriberAction.Result res = action.call()
```

6.1.1.2.60 UnsubscribeSNSTopic

API Request

URLs

```
DELETE zstack/v1/sns/topics/{topicUuid}/endpoints/{endpointUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/
sns/topics/bd6c49ad623a3740880ca6d3ed3bb793/
endpoints/36d6eb53f7c23fbca1ac72008940efc8?
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
topicUuid	String	url	The topic UUID.		2.3
endpointUuid	String	url	The endpoint UUID.		2.3
systemTags	List	body	Optional. The system tags.		2.3
userTags	List	body	Optional. The user tags.		2.3

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
UnsubscribeSNSTopicAction action = new UnsubscribeSNSTopicAction();
action.topicUuid = "bd6c49ad623a3740880ca6d3ed3bb793";
action.endpointUuid = "36d6eb53f7c23fbca1ac72008940efc8";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UnsubscribeSNSTopicAction.Result res = action.call();
```

Python SDK

```
UnsubscribeSNSTopicAction action = UnsubscribeSNSTopicAction()
action.topicUuid = "bd6c49ad623a3740880ca6d3ed3bb793"
action.endpointUuid = "36d6eb53f7c23fbca1ac72008940efc8"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UnsubscribeSNSTopicAction.Result res = action.call()
```

6.1.1.2.61 CreateSNSSnmpEndpoint

API Request

URLs

```
POST zstack/v1/sns/sms-endpoints/snmp
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "snmp endpoint",
    "platformUuid": "c453382b049c3280b69157501914870d"
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \-X POST -d

details	String	The details about the error.	5.0.0
elaboration	String	The reserved field. Default value: null.	5.0.0
opaque	LinkedHashMap	The reserved field. Default value: null.	5.0.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	5.0.0

#inventory

Name	Type	Description	Starting Version
name	String	The name of the resource.	5.0.0
uuid	String	The resource uuid.	5.0.0
description	String	The detailed description of the resource.	5.0.0
type	String	The resource type.	5.0.0
platformUuid	String	The application platform.	5.0.0
createDate	Timestamp	The creation date.	5.0.0
lastOpDate	Timestamp	The last operation date.	5.0.0

SDK Sample

Java SDK

```
CreateSNSSnmpEndpointAction action = new CreateSNSSnmpEndpointAction
();
action.name = "snmp endpoint";
action.platformUuid = "c453382b049c3280b69157501914870d";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
CreateSNSSnmpEndpointAction.Result res = action.call();
```

Python SDK

```
CreateSNSSnmpEndpointAction action = CreateSNSSnmpEndpointAction()
action.name = "snmp endpoint"
action.platformUuid = "c453382b049c3280b69157501914870d"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CreateSNSSnmpEndpointAction.Result res = action.call()
```

6.1.1.2.62 CreateSNSSnmpPlatform

API Request

URLs

```
POST zstack/v1/sns/application-platforms/snmp
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "snmpAddress": "127.0.0.1",
    "snmpPort": 161,
    "name": "snmp platform"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"snmpAddress":"127.0.0.1","snmpPort":161,"name":"snmp platform"}}' \
http://localhost:8080/zstack/v1/sns/application-platforms/snmp
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
snmpAddress	String	body (contained in the params structure)	The SNMP server address.		5.0.0
snmpPort	Integer	body (contained in the params structure)	The SNMP port.		5.0.0
name	String	body (contained in the params structure)	The resource name.		5.0.0
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		5.0.0
resourceUuid	String	body (contained in the params structure)	Optional. The resource uuid.		5.0.0
tagUuids	List	body (contained in the params structure)	Optional. The tag uuid list.		5.0.0
systemTags	List	body	Optional. The system tags.		5.0.0
userTags	List	body	Optional. The user tags.		5.0.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "660744a0d0cd4fe4ad1c11181955f30f",
    "name": "email platform",
    "description": "example description",
    "state": "Enabled",
    "type": "Email",
```

```

    "createDate": "Dec 25, 2023 2:07:14 PM",
    "lastOpDate": "Dec 25, 2023 2:07:14 PM"
  }
}

```

Name	Type	Description	Starting Version
success	boolean		5.0.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	5.0.0
inventory	SNSApplicationPlatformInventory	See inventory .	5.0.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	5.0.0
description	String	The brief description of the error.	5.0.0
details	String	The details about the error.	5.0.0
elaboration	String	The reserved field. Default value: null.	5.0.0
opaque	LinkedHashMap	The reserved field. Default value: null.	5.0.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	5.0.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	5.0.0
name	String	The resource name.	5.0.0
description	String	The detailed description of the resource.	5.0.0
type	String	The type.	5.0.0
createDate	Timestamp	The creation date.	5.0.0
lastOpDate	Timestamp	The last operation date.	5.0.0

SDK Sample

Java SDK

```
CreateSNSSnmpPlatformAction action = new CreateSNSSnmpPlatformAction
();
action.snmpAddress = "127.0.0.1";
action.snmpPort = 161;
action.name = "snmp platform";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateSNSSnmpPlatformAction.Result res = action.call();
```

Python SDK

```
CreateSNSSnmpPlatformAction action = CreateSNSSnmpPlatformAction()
action.snmpAddress = "127.0.0.1"
action.snmpPort = 161
action.name = "snmp platform"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CreateSNSSnmpPlatformAction.Result res = action.call()
```

6.1.1.2.63 SNSSnmpTestConnection

API Request

URLs

```
POST zstack/v1/sns/application-endpoints/snmp/test-connection
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "platformUuid": "d71f754a80663dc7a6a2003cc5667846",
```

```
"endpointUuid": "e3a38d5d8d123991bd0a986150f3e6df"
},
"systemTags": [],
"userTags": []
}
```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"platformUuid": "d71f754a80663dc7a6a2003cc5667846", "endpointUuid": "e3a38d5d8d123991bd0a986150f3e6df",
"http://localhost:8080/zstack/v1/sns/application-endpoints/snmp/test-connection"
```

Request Parameters

Name	Type	Location	Description	Valid Values	Starting Version
platformUuid	String	body (contained in the params structure)	Optional. The SNMP Platform UUID.		5.1.8
endpointUuid	String	body (contained in the params structure)	Optional. The SNMP endpoint UUID.		5.1.8
systemTags	List	body	Optional. The system tags.		5.1.8
userTags	List	body	Optional. The user tags.		5.1.8

API Response**Sample Response**

```
{
  "connected": true,
  "webhookResp": {}
}
```

}

Name	Type	Description	Starting Version
success	boolean		5.1.8
connected	boolean	Whether the endpoint is connected.	5.1.8
webhookResp	LinkedHashMap	The response from the endpoint.	5.1.8
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	5.1.8

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	5.1.8
description	String	The brief description of the error.	5.1.8
details	String	The details about the error.	5.1.8
elaboration	String	The reserved field. Default value: null.	5.1.8
opaque	LinkedHashMap	The reserved field. Default value: null.	5.1.8
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	5.1.8

SDK Sample

Java SDK

```
SNSSnmpTestConnectionAction action = new SNSSnmpTestConnectionAction
();
action.platformUuid = "d71f754a80663dc7a6a2003cc5667846";
action.endpointUuid = "e3a38d5d8d123991bd0a986150f3e6df";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
SNSSnmpTestConnectionAction.Result res = action.call();
```

Python SDK

```
SNSSnmpTestConnectionAction action = SNSSnmpTestConnectionAction()
action.platformUuid = "d71f754a80663dc7a6a2003cc5667846"
action.endpointUuid = "e3a38d5d8d123991bd0a986150f3e6df"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
SNSSnmpTestConnectionAction.Result res = action.call()
```

6.1.1.2.64 QuerySNSSnmpPlatform

API Request

URLs

```
GET zstack/v1/sns/application-platforms/snmp
GET zstack/v1/sns/application-platforms/snmp/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/sns/application-platforms/snmp?
q=name=snmp
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/sns/application-platforms/snmp/
b9a635c9ff7c3544a232cad5b9a4aaf7
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QuerySNSSnmpPlatform`, and pressing the **Tab** key.

API Response

Sample Response

The API returns an empty JSON structure {} upon successful execution, and in case of an error, the returned JSON structure includes an "error" field, for example:

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
QuerySNSSnmpPlatformAction action = new QuerySNSSnmpPlatformAction();
action.conditions = asList("name=snmp");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QuerySNSSnmpPlatformAction.Result res = action.call();
```

Python SDK

```
QuerySNSSnmpPlatformAction action = QuerySNSSnmpPlatformAction()
action.conditions = ["name=snmp"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QuerySNSSnmpPlatformAction.Result res = action.call()
```

6.1.1.2.65 UpdateSNSSnmpPlatform

API Request

URLs

```
PUT zstack/v1/sns/application-platforms/snmp/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateSNSSnmpPlatform": {
    "snmpAddress": "127.0.0.1",
    "snmpPort": 161,
    "name": "snmp platform name"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateSNSSnmpPlatform":
{"snmpAddress":"127.0.0.1","snmpPort":161,"name":"snmp platform
name"}}' \
http://localhost:8080/zstack/v1/sns/application-platforms/snmp/
cbd548888e9d37b594bc99c1892589ed
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
snmpAddress	String	body (contained in the updateSNSSnmpPlatform structure)	The SNMP server address.		
snmpPort	Integer	body (contained in the updateSNSSnmpPlatform structure)	The SNMP port.		5.0.0
uuid	String	url	The resource uuid.		5.0.0
name	String	body (contained in the updateSNSSnmpPlatform structure)	Optional. The resource name.		5.0.0
description	String	body (contained in the updateSNSSnmpPlatform structure)	Optional. The detailed description of the resource.		5.0.0

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	body	Optional. The system tags.		5.0.0
userTags	List	body	Optional. The user tags.		5.0.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "3bafba4ecdd647e8ba092a0adffcc9fe",
    "name": "email platform",
    "description": "example description",
    "state": "Enabled",
    "type": "Email",
    "createDate": "Dec 25, 2023 2:06:05 PM",
    "lastOpDate": "Dec 25, 2023 2:06:05 PM"
  }
}
```

Name	Type	Description	Starting Version
success	boolean		5.0.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	5.0.0
inventory	SNSApplicationPlatformInventory	See inventory .	5.0.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	5.0.0

Name	Type	Description	Starting Version
description	String	The brief description of the error.	5.0.0
details	String	The details about the error.	5.0.0
elaboration	String	The reserved field. Default value: null.	5.0.0
opaque	LinkedHashMap	The reserved field. Default value: null.	5.0.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	5.0.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	5.0.0
name	String	The resource name.	5.0.0
description	String	The detailed description of the resource.	5.0.0
type	String	The type.	5.0.0
createDate	Timestamp	The creation date.	5.0.0
lastOpDate	Timestamp	The last operation date.	5.0.0

SDK Sample

Java SDK

```
UpdateSNSSnmpPlatformAction action = new UpdateSNSSnmpPlatformAction
();
action.snmpAddress = "127.0.0.1";
action.snmpPort = 161;
action.uuid = "cbd548888e9d37b594bc99c1892589ed";
action.name = "snmp platform name";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
UpdateSNSSnmpPlatformAction.Result res = action.call();
```

Python SDK

```
UpdateSNSSnmpPlatformAction action = UpdateSNSSnmpPlatformAction()
action.snmpAddress = "127.0.0.1"
action.snmpPort = 161
action.uuid = "cbd548888e9d37b594bc99c1892589ed"
action.name = "snmp platform name"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateSNSSnmpPlatformAction.Result res = action.call()
```

6.1.1.2.66 SNSMicrosoftTeamsTestConnection

API Request

URLs

```
POST zstack/v1/sns/application-endpoints/we-com/test-connection
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "url": "https://qyapi.weixin.qq.com/cgi-bin/webhook/send?key\u003df8b9014a-207a-44d5-ae26-3501bf01dbc4",
    "atAll": false,
    "atPersonUserIds": [
      "zhangsan",
      "lisi"
    ],
    "testMsg": "hello",
    "endpointUuid": "1c201c27a81740ddadabc5d2f3f38a5e4"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"url":"https://qyapi.weixin.qq.com/cgi-bin/webhook/send?key=f8b9014a-207a-44d5-ae26-3501bf01dbc4","atAll":false,"atPersonUserIds":
```

```

http://localhost:8080/zstack/v1/sns/application-endpoints/we-com/test-connection
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
testMsg	String	body (contained in the params structure)	Testing message text.		5.0.0
endpointUuid	String	body (contained in the params structure)	Optional. The WeCom endpoint uuid.		5.0.0
systemTags	List	body	Optional. The system tag.		5.0.0
userTags	List	body	Optional. The user tag.		5.0.0
url	String	body (contained in the params structure)	Optional. The webhook url.		5.0.0
atAll	Boolean		Optional. @all people		5.0.0
atPersonUserIds	List		Optional. @user id collection.		5.0.0

API Response

Sample Response

```
{
  "connected": true,
  "webhookResp": {}
}
```

Name	Type	Description	Starting Version
success	boolean		5.0.0

Name	Type	Description	Starting Version
connected	boolean	The webhook url connectivity id. (connectivity only)	5.0.0
webhookResp	boolean	Webhook url sends a test message to the other end of the return.	5.0.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	5.0.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	5.0.0
description	String	The brief description of the error.	5.0.0
details	String	The details about the error.	5.0.0
elaboration	String	The reserved field. Default value: null.	5.0.0
opaque	LinkedHashMap	The reserved field. Default value: null.	5.0.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	5.0.0

SDK Sample

Java SDK

```
SNSWeComTestConnectionAction action = new SNSWeComTestConnectionAction();

    "atPersonList": {
      "13377778888": "jack"
    },
    "name": "wecom"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"url":"https://qyapi.weixin.qq.com/cgi-bin/webhook/send?key=f8b9014a-207a-44d5-ae26-3501bf01dbc4","atAll":false,"atPersonUserIds":["18900002222","13377778888"],"atPersonList":{"13377778888":"jack"},"name":"wecom"}}' \
http://localhost:8080/zstack/v1/sns/application-endpoints/we-com
```

Request Parameters

Name	Type	Location	Description	Options Value	Starting Version
url	String	body (contained in the params structure)	The webhook URL of the WeCom robot.		5.0.0
atAll	Boolean	body (contained in the params structure)	Optional. Whether to notify all (@All) members in a WeCom group.		5.0.0
atPersonUsersIds	List	body (contained in the params structure)	Optional. @user_id.		5.0.0
name	String	body (contained in the params structure)	The resource name.		5.0.0
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		5.0.0
platformUuid	String	body (contained in the params structure)	Optional. The notification platform uuid.		5.0.0
resourceUuid	String	body (contained in the params structure)	Optional. The resource uuid.		5.0.0
tagUuids	List	body (contained in the params structure)	Optional. The tag uuid list.		5.0.0
systemTags	List	body	Optional. The system tags.		5.0.0

Name	Type	Location	Description	Options Value	Starting Version
userTags	List	body	Optional. The user tags.		5.0.0
atPersonList	Map	body (contained in the params structure)	Optional. The @person information. (Recommend)		5.0.0

API Response

Sample Response

```
{
  "inventory": {
    "url": "http://wecom-url",

}
```

Name	Type	Description	Starting Version
success	boolean		5.0.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	5.0.0
inventory	SNSWeComEndpointInventory	See inventory	5.0.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error	5.0.0

Name	Type	Description	Starting Version
		. For example, SYS.1000, HOST.1001.	
description	String	The brief description of the error.	5.0.0
details	String	The details about the error.	5.0.0
elaboration	String	The reserved field. Default value: null.	5.0.0
opaque	LinkedHashMap	The reserved field. Default value: null.	5.0.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	5.0.0

#inventory

Name	Type	Description	Starting Version
url	String	The URL of the WeCom robot.	5.0.0
atAll	boolean	Whether to notify all (@All) members in a WeCom group.	5.0.0
atPersonUserIds	List	The user id of the group member to be notified (the @user_id).	5.0.0
name	String	The resource name.	5.0.0
uuid	String	The resource UUID.	5.0.0
description	String	The detailed description of the resource.	5.0.0
type	String	The endpoint type.	5.0.0
state	String	The application platform.	5.0.0

Name	Type	Description	Starting Version
platformUuid	String	The application platform UUID.	5.0.0
createDate	Timestamp	The creation date.	5.0.0
lastOpDate	Timestamp	The last operation date.	5.0.0
platform	SNSApplicationPlatformInventory	See platform .	5.0.0

platform

Name	Type	Description	Starting Version
uuid	String	The resource uuid.	5.0.0
name	String	The resource name.	5.0.0
description	String	The detailed description of the resource.	5.0.0
type	String	The resource type.	5.0.0
createDate	Timestamp	The creation date.	5.0.0
lastOpDate	Timestamp	The last operation date.	5.0.0

SDK Sample

Java SDK

```
CreateSNSWeComEndpoint action = new CreateSNSWeComEndpoint();
action.url = "https://qyapi.weixin.qq.com/cgi-bin/webhook/send?key\u003df8b9014a-207a-44d5-ae26-3501bf01dbc4";
action.atAll = false;
action.atPersonUserIds = asList("18900002222", "13377778888");
action.name = "wecom";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateSNSWeComEndpoint.Result res = action.call();
```

Python SDK

```
CreateSNSWeComEndpoint action = new CreateSNSWeComEndpoint()
action.url = "https://qyapi.weixin.qq.com/cgi-bin/webhook/send?key\u003df8b9014a-207a-44d5-ae26-3501bf01dbc4"
action.atAll = false
action.atPersonUserIds = asList("18900002222", "13377778888")
action.name = "wecom"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
CreateSNSWeComEndpoint.Result res = action.call()
```

6.1.1.2.69 RemoveSNSWeComAtPerson

API Request

URLs

```
DELETE zstack/v1/sns/application-endpoints/we-com/{endpointUuid}/at-  
persons/{userId}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \  
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \  
-X DELETE http://localhost:8080/zstack/v1/sns/application-endpoints/  
we-com/169842ede65135aeb32d0a88b644f8eb/at-persons/18988887777?
```

Request Parameters

Name	Type	Location	Description	Optional Version	Starting Version
endpointUuid	String	url	The WeCom rebot webhook url.		5.0.0
userId	String	url	TheWebCom user Id.		5.0.0
deleteMode	String	body	Optional. Delete mode(Permissive / Enforcing, Permissive)		5.0.0
systemTags	List	body	Optional. The system tag.		5.0.0
userTags	List	body	Optional. The user tag.		5.0.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
RemoveSNSWeComAtPersonAction action = new RemoveSNSWeComAtPersonAction
();
action.endpointUuid = "169842ede65135aeb32d0a88b644f8eb";
action.userId = "18988887777";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
RemoveSNSWeComAtPersonAction.Result res = action.call();
```

Python SDK

```
RemoveSNSWeComAtPersonAction action = RemoveSNSWeComAtPersonAction()
action.endpointUuid = "169842ede65135aeb32d0a88b644f8eb"
action.userId = "18988887777"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
RemoveSNSWeComAtPersonAction.Result res = action.call()
```

6.1.1.2.70 UpdateAtPersonOfAtWeComEndpoint

API Request

URLs

```
PUT zstack/v1/sns/application-endpoints/we-com/at-persons/{uuid}/
actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateAtPersonOfAtWeComEndpoint": {
    "endpointUuid": "4aec8a68c63439f197df9623ec89cda6",
    "userId": "zhang.san",
    "remark": "jack"
  }
}
```

```

    },
    "systemTags": [],
    "userTags": []
  }

```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateAtPersonOfAtWeComEndpoint":

Python SDK

```
GetManagementNodeDirCapacityAction action = GetManagementNodeDirCapacityAction()
action.managementNodeUuids = ["33a2f11d59aa321aa4acfa78afe8f35a", "6bf0aca356a13cf787d87ceeb8fcb7f"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetManagementNodeDirCapacityAction.Result res = action.call()
```

6.2 Backup Management

6.2.1 Backup Service (Plus)

The Backup Service feature is provided in a separate module. Before you can use this feature, you need to purchase the Plus License of Backup Service, in addition to the Base License.

6.2.1.1 Backup Service Operations

6.2.1.1.1 CreateVolumeBackup

API Request

URLs

```
POST zstack/v1/volumes/{volumeUuid}/volume-backups
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "backupStorageUuid": "1c4b0a3a24533c4faa9b156a0ef98fdf",
    "name": "backup-1",
    "description": "a critical volume backup"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"backupStorageUuid":"1c4b0a3a24533c4faa9b156a0ef98fdf","name":"backup-1","description":"a critical volume backup"}}' http://localhost:8080/zstack/v1/volumes/ec7196ba2d993236aceddd9b31f5d19b/volume-backups
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
volumeUuid	String	body (contained in the params structure)	The UUID of the volume.		2.6.0

Name	Type	Location	Description	Optional Value	Starting Version
backupStorageUuid	String	body (contained in the params structure)	The UUID of the backup storage.		2.6.0
name	String	body (contained in the params structure)	The name of the backup.		2.6.0
description	String	body (contained in the params structure)	Optional. The detailed description of the backup.		2.6.0
resourceUuid	String	body (contained in the params structure)	Optional. Specify a UUID of the backup.		2.6.0
volumeReadBandwidth	Long	body (contained in the params structure)	Optional. The maximum speed at which data from the volume is read.		3.1.0
volumeWriteBandwidth	Long	body (contained in the params structure)	Optional. The maximum speed at which data is written to the volume.		3.1.0
networkReadBandwidth	Long	body (contained in the params structure)	Optional. The network bandwidth for data reads.		3.1.0
networkWriteBandwidth	Long	body (contained in the params structure)	Optional. The network bandwidth for data writes.		3.1.0

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	body	Optional. The system tags.		2.6.0
userTags	List	body	Optional. The user tags.		2.6.0

**Note:**

- When you create a volume backup in ZStack Cloud, the data of the volume in a host will be backed up to an ImageStore backup storage. Note that the data exchange in this process will use the backup network. You can add the **backupnetwork** option to **SystemTags**.
 - Format of the **backupnetwork** option: `backup::network::cidr::CIDR`
 - Example: `backup::network::cidr::10.0.0.0/8`
- When you create a volume backup in ZStack Cloud, you can specify how to back up the volume data to the backup storage by adding the **fsInfo** option to **SystemTags**.
 - Format of the **fsInfo** option: `fsInfo::type::$TYPE::url::$URL::options::$OPTIONS`
 - Example: `fsInfo::type::nfs::url::172.32.1.119:/nas/nfs2::options::nolock,vers=3,rsiz=32768,wsiz=32768`
- When you create a volume backup in ZStack Cloud, you can configure the concurrency level for the volume backup by adding the **volumeLiveBackup** option to **SystemTags**.
 - Format of the **volumeLiveBackup** option: `volumeLiveBackup::parallelismDegree::$NUMBER`
 - Example: `volumeLiveBackup::parallelismDegree::1`

lastOpDate	Timestamp	The time when the backup was last modified.	2.6.0

SDK Sample

Java SDK

```
CreateVolumeBackupAction action = new CreateVolumeBackupAction();
action.volumeUuid = "ec7196ba2d993236aceddd9b31f5d19b";
action.backupStorageUuid = "1c4b0a3a24533c4faa9b156a0ef98fdf";
action.name = "backup-1";
action.description = "a critical volume backup";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateVolumeBackupAction.Result res = action.call();
```

Python SDK

```
CreateVolumeBackupAction action = CreateVolumeBackupAction()
action.volumeUuid = "ec7196ba2d993236aceddd9b31f5d19b"
action.backupStorageUuid = "1c4b0a3a24533c4faa9b156a0ef98fdf"
action.name = "backup-1"
action.description = "a critical volume backup"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CreateVolumeBackupAction.Result res = action.call()
```

6.2.1.1.2 DeleteVolumeBackup

API Request

URLs

```
DELETE zstack/v1/volume-backups/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/volume-backups/
e95ef48f7cc6396f8e025fd5e38ebccb
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The UUID of the volume backup.		2.6.0
backupStorageUuids	List	url	Optional. The UUIDs of the backup storage.		2.6.0
deleteMode	String	url	Optional. The mode under which the backup is deleted.		2.6.0
systemTags	List	body	Optional. The system tags.		2.6.0
userTags	List	body	Optional. The user tags.		2.6.0
handleDependency	boolean	body	Optional. whether to handle dependency when deleting volume backup.		4.7.11

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteVolumeBackupAction action = new DeleteVolumeBackupAction();
```

```

action.uuid = "e95ef48f7cc6396f8e025fd5e38ebccb";
action.backupStorageUuids = asList("6cfa909085e13160825db03bcd664ff2");
action.handleDependency = false;
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteVolumeBackupAction.Result res = action.call();

```

Python SDK

```

DeleteVolumeBackupAction action = DeleteVolumeBackupAction()
action.uuid = "e95ef48f7cc6396f8e025fd5e38ebccb"
action.backupStorageUuids = ["6cfa909085e13160825db03bcd664ff2"]
action.handleDependency = false
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteVolumeBackupAction.Result res = action.call()

```

6.2.1.1.3 QueryVolumeBackup

API Request

URLs

```

GET zstack/v1/volume-backups
GET zstack/v1/volume-backups/{uuid}

```

Headers

```

Authorization: OAuth the-session-uuid

```

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/volume-backups?
q=uuid=12d9162338f637c2855f58b63a7f19d5

```

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/volume-
backups/09de4206bb143d75aad644c88cddb364

```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryVolumeBackup**, and pressing the Tab key.

API Response

Sample Response

```

SDK Sample

Java SDK

```
QueryVolumeBackupAction action = new QueryVolumeBackupAction();
action.conditions = asList("uuid=031d210f004e31529b7ae7beb73c8bb9");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryVolumeBackupAction.Result res = action.call();
```

Python SDK

```
QueryVolumeBackupAction action = QueryVolumeBackupAction()
action.conditions = ["uuid=4ec7c280156635b1a8164d6c9e455b41"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryVolumeBackupAction.Result res = action.call()
```

6.2.1.1.4 CreateDataVolumeTemplateFromVolumeBackup

API Request

URLs

```
POST zstack/v1/images/data-volume-templates/from/volume-template/
{backupUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "backupStorageUuid": "030d573ce5f33ab1b53524f8bef1c2cd",
    "name": "template",
    "description": "data template from volume backup",
    "system": false
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":

```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error	2.6.0
inventory	ImageInventory	See inventory	2.6.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	2.6.0
description	String	The brief description of the error.	2.6.0
details	String	The details about the error.	2.6.0
elaboration	String	The reserved field. Default value: null.	2.6.0
opaque	LinkedHashMap	The reserved field. Default value: null.	2.6.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	2.6.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The UUID of the root volume image.	2.6.0
name	String	The name of the image.	2.6.0
description	String	The detailed description of the image.	2.6.0
state	String	The state of the image.	4.0.0
status	String	The readiness of the image.	4.0.0
size	Long	The size of the image.	4.0.0

Name	Type	Description	Starting Version
actualSize	Long	The actual storage space used by the image.	4.0.0
md5Sum	String	The MD5 value of the image.	4.0.0
url	String	The URL of the image.	4.0.0
mediaType	String	The type of the image.	4.0.0
guestOsType	String	The type of the guest OS.	4.0.0
type	String	The interval used field.	4.0.0
platform	String	The system platform of the image.	4.0.0
format	String	The format of the image, for example, raw.	4.0.0
system	Boolean	Specifies whether the image is a system image.	4.0.0
createDate	Timestamp	The time when the image was created.	2.6.0
lastOpDate	Timestamp	The time when the image was last modified.	2.6.0
backupStorageRefs	List	See backupStorageRefs	2.6.0

#backupStorageRefs

Name	Type	Description	Starting Version
imageUuid	String	The UUID of the root volume image.	2.6.0
backupStorageUuid	String	The UUID of the backup storage.	2.6.0
installPath	String	The installation path of the image on the backup storage.	4.0.0

Name	Type	Description	Starting Version
exportUrl	String	The exported URL of the image.	4.0.0
exportMd5Sum	String	The MD5 value of the exported image.	4.0.0
status	String	The readiness of the image.	4.0.0
createDate	Timestamp	The time when the image was created.	2.6.0
lastOpDate	Timestamp	The time when the image was last modified.	2.6.0

SDK Sample

Java SDK

```
CreateRootVolumeTemplateFromVolumeBackupAction action = new CreateRootVolumeTemplateFromVolumeBackupAction();
action.backupUuid = "84eccd458028338d8f5eb72efdc6f8a7";
action.backupStorageUuid = "9681bf8631a133ccb84fc5cf6ff7aaa6";
action.name = "template";
action.description = "root template from volume backup";
action.system = false;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateRootVolumeTemplateFromVolumeBackupAction.Result res = action.call();
```

Python SDK

```
CreateRootVolumeTemplateFromVolumeBackupAction action = CreateRootVolumeTemplateFromVolumeBackupAction()
action.backupUuid = "84eccd458028338d8f5eb72efdc6f8a7"
action.backupStorageUuid = "9681bf8631a133ccb84fc5cf6ff7aaa6"
action.name = "template"
action.description = "root template from volume backup"
action.system = false
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
CreateRootVolumeTemplateFromVolumeBackupAction.Result res = action.  
call()
```

6.2.1.1.6 SyncVolumeBackup

API Request

URLs

```
PUT zstack/v1/volume-backups/imageStore/{imageStoreUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{  
  "syncVolumeBackup": {},  
  "systemTags": [],  
  "userTags": []  
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \  
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \  
-X PUT -d '{"syncVolumeBackup":{}}' http://localhost:8080/zstack/v1/  
volume-backups/imageStore/d84c15efe2e941e38d090299bb5b498c/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
imageStore Uuid	String	url	The UUID of the backup storage.		3.5.0
systemTags	List	body			3.5.0
userTags	List	body			3.5.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
SyncVolumeBackupAction action = new SyncVolumeBackupAction();
action.imageStoreUuid = "90658f04b39d40369593a7e56ab62e15";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
SyncVolumeBackupAction.Result res = action.call();
```

Python SDK

```
SyncVolumeBackupAction action = SyncVolumeBackupAction()
action.imageStoreUuid = "91570173248a40d7a02e3905e50c7ad6"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
SyncVolumeBackupAction.Result res = action.call()
```

6.2.1.1.7 RevertVolumeFromVolumeBackup

API Request

URLs

```
PUT zstack/v1/volume-backups/{uuid}/actions?卷备份uuid={volume backup
uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "revertVolumeFromVolumeBackup": {
    "backupStrokeUuid": "7031eaf192333f52a0cd889327d5a0de"
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"revertVolumeFromVolumeBackup":
{"backupStorageUuid":"7031eaf192333f52a0cd889327d5a0de"}}'
http://localhost:8080/zstack/v1/volume-backups/
b3f89ba2d4173bc5864d1b0d19e93f22/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
卷备份uuid	String	url	The UUID of the volume backup.		2.6.0
backupStorageUuid	String	body (contained in the revertVolumeFromVolumeBackup structure)	Optional. The UUID of the backup storage.		2.6.0
systemTags	List	body	Optional. The system tags.		2.6.0
userTags	List	body	Optional. The user tags.		2.6.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
RevertVolumeFromVolumeBackupAction action = new RevertVolumeFromVolumeBackupAction();
action.uuid = "b3f89ba2d4173bc5864d1b0d19e93f22";
action.backupStrokeUuid = "7031eaf192333f52a0cd889327d5a0de";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
RevertVolumeFromVolumeBackupAction.Result res = action.call();
```

Python SDK

```
RevertVolumeFromVolumeBackupAction action = RevertVolumeFromVolumeBackupAction()
action.uuid = "b3f89ba2d4173bc5864d1b0d19e93f22"
action.backupStrokeUuid = "7031eaf192333f52a0cd889327d5a0de"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
RevertVolumeFromVolumeBackupAction.Result res = action.call()
```

6.2.1.1.8 RecoverBackupFromImageStoreBackupStorage

API Request

URLs

```
PUT zstack/v1/volume-backups/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "recoverBackupFromImageStoreBackupStorage": {
    "srcBackupStorageUuid": "cdd6242179f037c3a2c4cd1d17678f36",
    "dstBackupStorageUuid": "eebba83336ac34938e5a6e6db30d5eb8"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
```

```
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"recoverBackupFromImageStoreBackupStorage":
{"srcBackupStorageUuid":"cdd6242179f037c3a2c4cd1d17678f36","dstBackupStorageUuid":
http://localhost:8080/zstack/v1/volume-
backups/4c047b04165e3c8ca2b4859ddf41d882/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The UUID of the volume backup.		2.6.0
srcBackupStorageUuid	String	body (contained in the recoverBackupFromImageStoreBackupStorage structure)	The UUID of the source backup storage.		2.6.0
dstBackupStorageUuid	String	body (contained in the recoverBackupFromImageStoreBackupStorage structure)	The UUID of the destination backup storage.		2.6.0
systemTags	List	body	Optional. The system tags.		2.6.0
userTags	List	body	Optional. The system tags.		2.6.0

API Response

Sample Response

```
{

SyncBackupFromImageStoreBackupStorageActionResult res = action.call()

```

6.2.1.1.10 CreateVmBackup

API Request

URLs

```
POST zstack/v1/volumes/{rootVolumeUuid}/vm-backups
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```

{
  "params": {
    "backupStorageUuid": "fc50c1ece4753c1981e3e3f65a151e0e",
    "name": "backup-1",
    "description": "a critical volume backup"
  },
  "systemTags": [],
  "userTags": []
}

```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"backupStorageUuid":"fc50c1ece4753c1981e3e3f65a151e0e", "name":"backup-1", "description": "a critical volume backup"}}' http://localhost:8080/zstack/v1/volumes/aa6fad9b71af3785a9fdec200bab3ee8/vm-backups

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
rootVolumeUuid	String	url	The UUID of the root volume.		3.0.0

Name	Type	Location	Description	Optional Value	Starting Version
backupStorageUuid	String	body (contained in the params structure)	The UUID of the backup storage.		3.0.0
name	String	body (contained in the params structure)	The name of the VM backup.		3.0.0
description	String	body (contained in the params structure)	Optional. The detailed description of the backup.		3.0.0
resourceUuid	String	body (contained in the params structure)	Optional.		3.0.0
volumeReadBandwidth	Long	body (contained in the params structure)	Optional. The maximum speed at which data is read from the root volume.		3.1.0
volumeWriteBandwidth	Long	body (contained in the params structure)	Optional. The maximum speed at which data is written to the root volume.		3.1.0
networkReadBandwidth	Long	body (contained in the params structure)	Optional. The network bandwidth for data reads.		3.1.0
networkWriteBandwidth	Long	body (contained in the params structure)	Optional. The network bandwidth for data writes.		3.1.0
systemTags	List	body	Optional.		3.0.0

Name	Type	Location	Description	Optional Value	Starting Version
userTags	List	body	Optional.		3.0.0

**Note:**

- When you create a VM backup in ZStack Cloud, the data of the VM instance in a host will be backed up to an ImageStore backup storage. The data exchange in this process will use the backup network. Note that you can add the **backupnetwork** option to **SystemTags**.
 - Format of the **backupnetwork** option: `backup::network::cidr::CIDR`
 - Example: `backup::network::cidr::10.0.0.0/8`
- When you create a VM backup in ZStack Cloud, you can specify how to back up the VM instance data to the backup storage by adding the **fsInfo** option to **SystemTags**.
 - Format of the **fsInfo** option: `fsInfo::type::$TYPE::url::$URL::options::$OPTIONS`
 - Example: `fsInfo::type::nfs::url::172.32.1.119:/nas/nfs2::options::nolock,vers=3,rsiz=32768,wsiz=32768`
- When you create a VM backup in ZStack Cloud, you can configure the concurrency level for the VM backup by adding the **volumeLiveBackup** option to **SystemTags**.
 - Format of the **volumeLiveBackup** option: `volumeLiveBackup::parallelismDegree::$NUMBER`
 - Example: `volumeLiveBackup::parallelismDegree::1`

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error	3.0.0
inventories	List	See inventories	3.0.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.0.0
description	String	The brief description of the error.	3.0.0
details	String	The details about the error.	3.0.0
elaboration	String	The reserved field. Default value: null.	3.0.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.0.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.0.0

#inventories

Name	Type	Description	Starting Version
uuid	String	The UUID of the VM backup.	3.0.0
volumeUuid	String	The UUID of the root volume.	3.0.0
name	String	The name of the backup.	3.0.0
description	String	The detailed description of the backup.	3.0.0
type	String	The type of the root volume.	3.0.0
state	String	The status of the backup.	3.0.0
status	String	The availability status of the backup.	3.0.0
size	Long	The size of the backup.	3.0.0
metadata	String	The metadata of the backup.	3.0.0
createDate	Timestamp	The time when the backup was created.	3.0.0
lastOpDate	Timestamp	The time when the backup was last modified.	3.0.0
backupStorageRefs	List	See backupStorageRefs	3.0.0

#backupStorageRefs

Name	Type	Description	Starting Version
volumeBackupUuid	String	The UUID of the VM backup.	3.0.0
backupStorageUuid	String	The UUID of the backup storage.	3.0.0
installPath	String	The storage path of the backup.	3.0.0

Name	Type	Description	Starting Version
status	String	The status of the backup in the backup storage.	3.0.0
createDate	Timestamp	The time when the backup was created.	3.0.0
lastOpDate	Timestamp	The time when the backup was last modified.	3.0.0

SDK Sample

Java SDK

```
CreateVmBackupAction action = new CreateVmBackupAction();
action.rootVolumeUuid = "aa6fad9b71af3785a9fdec200bab3ee8";
action.backupStorageUuid = "fc50c1ece4753c1981e3e3f65a151e0e";
action.name = "backup-1";
action.description = "a critical volume backup";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateVmBackupAction.Result res = action.call();
```

Python SDK

```
CreateVmBackupAction action = CreateVmBackupAction()
action.rootVolumeUuid = "aa6fad9b71af3785a9fdec200bab3ee8"
action.backupStorageUuid = "fc50c1ece4753c1981e3e3f65a151e0e"
action.name = "backup-1"
action.description = "a critical volume backup"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CreateVmBackupAction.Result res = action.call()
```

6.2.1.1.11 DeleteVmBackup

API Request

URLs

```
DELETE zstack/v1/vm-backups/{groupUuid}?
backupStorageUuids={backupStorageUuids}&deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X DELETE http://localhost:8080/zstack/v1/
vm-backups/92046c016d7c3af7bdd4a5077fb91450?
backupStorageUuids=255fc896605f3237a22940fa92d8670b&deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
groupUuid	String	url	The UUID of the backup group.		3.0.0
backupStorageUuids	List	url	Optional. The UUIDs of backup storage.		3.0.0
deleteMode	String	url	Optional.		3.0.0
systemTags	List	body	Optional.		3.0.0
userTags	List	body	Optional.		3.0.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteVmBackupAction action = new DeleteVmBackupAction();
action.groupUuid = "92046c016d7c3af7bdd4a5077fb91450";
action.backupStorageUuids = asList("255fc896605f3237a22940fa92d8670b");
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteVmBackupAction.Result res = action.call();
```

Python SDK

```
DeleteVmBackupAction action = DeleteVmBackupAction()
action.groupUuid = "92046c016d7c3af7bdd4a5077fb91450"
```

```

action.backupStorageUuids = [255fc896605f3237a22940fa92d8670b]
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteVmBackupAction.Result res = action.call()

```

6.2.1.1.12 SyncVmBackup

API Request

URLs

```
PUT zstack/v1/vm-backups/imageStore/{imageStoreUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```

{
  "syncVmBackup": {},
  "systemTags": [],
  "userTags": []
}

```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"syncVmBackup":{}}' http://localhost:8080/zstack/v1/vm-backups/imageStore/087b41055fbc4875aef622142cbe5ac3/actions

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
imageStore Uuid	String	url	The UUID of the backup storage.		3.5.0
systemTags	List	body	Optional.		3.5.0
userTags	List	body	Optional.		3.5.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
SyncVmBackupAction action = new SyncVmBackupAction();
action.imageStoreUuid = "7c3e52e35de449c9abc1343c83b93cd5";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
SyncVmBackupAction.Result res = action.call();
```

Python SDK

```
SyncVmBackupAction action = SyncVmBackupAction()
action.imageStoreUuid = "07270eb0ae25428586b224c33e88e485"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
SyncVmBackupAction.Result res = action.call()
```

6.2.1.1.13 CreateVmFromVmBackup

API Request

URLs

```
POST zstack/v1/vm-instances/from/vm-backups/{groupUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "vm1",
    "instanceOfferingUuid": "7d608371542b3ab5960823c1b57bfa0c",
    "l3NetworkUuids": [
      "6ab4d28582d232708ed2912c1c3eb1ef"
    ],
    "clusterUuid": "84a216b8b0323b87bf9d2b32abc635a3",
    "description": "this is a vm",
    "strategy": "InstantStart"
  },
}
```

```
"systemTags": [],
"userTags": []
}
```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8"
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c"
-X POST -d '{"params":
{"name": "vm1", "instanceOfferingUuid": "7d608371542b3ab5960823c1b57bfa0c", "l3Network
["6ab4d28582d232708ed2912c1c3eb1ef"], "clusterUuid": "84a216b8b0323b87bf9d2b32abc63
is a vm", "strategy": "InstantStart"}}' http://localhost:8080/zstack/
v1/vm-instances/from/vm-backups/04ac2beae2b03def881dea125299498c
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The name of the VM.		3.0.0
groupUuid	String	url	The UUID of the VM backup group.		3.0.0
backupStorageUuid	String	body (contained in the params structure)	Optional. The UUID of the backup storage.		0.6
instanceOfferingUuid	String	body (contained in the params structure)	The UUID of the instance offering.		3.0.0
l3NetworkUuids	List	body (contained in the params structure)	Optional. The UUIDs of L3 networks.		3.0.0

Name	Type	Location	Description	Optional Value	Starting Version
vmNicParams	String	body (contained in the params structure)	Optional. The information of the vmNic		4.7.0
type	String	body (contained in the params structure)	Optional. The type of the VM instance.	- UserVm - ApplianceVm	3.0.0
zoneUuid	String	body (contained in the params structure)	Optional. The zone UUID.		3.0.0
clusterUuid	String	body (contained in the params structure)	Optional. The cluster UUID.		3.0.0
hostUuid	String	body (contained in the params structure)	Optional. The host UUID.		3.0.0
primaryStorageUuidForRootVolume	String	body (contained in the params structure)	Optional. The primary storage used to host the root volume.		3.0.0
primaryStorageUuidForDataVolume	String	body (contained in the params structure)	Optional. The primary storage used to host data volumes.		3.0.0
description	String	body (contained in the params structure)	Optional. The detailed description of the VM.		3.0.0
rootVolumeSystemTags	List	body (contained in	Optional. The system tags		3.0.0

Name	Type	Location	Description	Optional Value	Starting Version
		the params structure)	of the root volume.		
dataVolumeSystemTags	List	body (contained in the params structure)	Optional. The system tags of the data volume.		3.0.0
defaultL3NetworkUuid	String	body (contained in the params structure)	The UUID of the L3 network .		3.0.0
resourceUuid	String	body (contained in the params structure)	Optional.		3.0.0
systemTags	List	body	Optional. The system tags.		3.0.0
userTags	List	body	Optional. The user tags.		3.0.0
tagUuids	List	body (contained in the params structure)	Optional. The tagUuids.		3.4.0
strategy	String	body (contained in the params structure)	Optional. The strategy to create vms.	- InstantStart - JustCreate - CreateStopped	5.1.0

**Note:**

- When you create a VM instance from a VM backup, you can specify the volume provisioning strategy by adding the **volumeProvisioningStrategy** option to **SystemTags**. The SystemTag is passed by using the **rootVolumeSystemTags** parameter.
- Format of the **volumeProvisioningStrategy** option: `volumeProvisioningStrategy::ThinProvisioning`, `volumeProvisioningStrategy::ThickProvisioning`

- Example: `volumeProvisioningStrategy::ThinProvisioning`, `volumeProvisioningStrategy::ThickProvisioning`

Request Parameters

Name	Type	Location	Description	Valid Values	Starting Version
name	String	body (contained in the params structure)	The VM instance name.		5.1.0
backupUuid	String	url	The backup UUID.		5.1.0
backupStorageUuid	String	body (contained in the params structure)	Optional. The backup storage UUID.		5.1.0
instanceOfferingUuid	String	body (contained in the params structure)	The instance offering UUID.		5.1.0
defaultL3NetworkUuid	String	body (contained in	Optional. The UUID of the		5.1.0

Name	Type	Location	Description	Valid Values	Starting Version
		the params structure)	default L3 network.		
l3NetworkUuids	List	body (contained in the params structure)	The L3 network UUID list.		5.1.0
type	String	body (contained in the params structure)	Optional. The VM instance type.	- UserVm - ApplianceVm	5.1.0
zoneUuid	String	body (contained in the params structure)	Optional. The zone UUID.		5.1.0
clusterUuid	String	body (contained in the params structure)	Optional. The cluster UUID.		5.1.0
hostUuid	String	body (contained in the params structure)	Optional. The host UUID.		5.1.0
primaryStorageUuidForRootVolume	String	body (contained in the params structure)	Optional. The UUID of the primary storage which the root volume resides on.		5.1.0
description	String	body (contained in the params structure)	Optional. The description of the VM instance.		5.1.0
rootVolumeSystemTags	List	body (contained in the params structure)	Optional. The system tag of the root volume.		5.1.0

Name	Type	Location	Description	Valid Values	Starting Version
resourceUuid	String	body (contained in the params structure)	Optional.		5.1.0
systemTags	List	body (contained in the params structure)	Optional. The system tag.		5.1.0
userTags	List	body	Optional. The user tag.		5.1.0
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID list.		5.1.0
strategy	String	body (contained in the params structure)	Optional. The VM creation strategy.	- InstantStart - JustCreate - CreateStopped	5.1.0

```

6.2.1.1.15 RevertVmFromVmBackup

API Request

URLs

```
PUT zstack/v1/vm-backups/{groupUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "revertVmFromVmBackup": {
    "backupStorageUuid": "99afb6149155396c8ac1b6ab62badb9d"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"revertVmFromVmBackup":
{"backupStorageUuid":"99afb6149155396c8ac1b6ab62badb9d"}}' http://
localhost:8080/zstack/v1/vm-backups/39f4e3c4b7553dbc98b8c0ce0e8f82a1/
actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
groupUuid	String	url	The UUID of the backup group.		3.0.0
backupStorageUuid	String	body (contained in the revertVmFromVmBackup structure)	Optional. The UUID of the backup storage.		3.0.0
systemTags	List	body	Optional.		3.0.0
userTags	List	body	Optional.		3.0.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
RevertVmFromVmBackupAction action = new RevertVmFromVmBackupAction();
action.groupUuid = "39f4e3c4b7553dbc98b8c0ce0e8f82a1";
action.backupStorageUuid = "99afb6149155396c8ac1b6ab62badb9d";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
RevertVmFromVmBackupAction.Result res = action.call();
```

Python SDK

```
RevertVmFromVmBackupAction action = RevertVmFromVmBackupAction()
action.groupUuid = "39f4e3c4b7553dbc98b8c0ce0e8f82a1"
action.backupStorageUuid = "99afb6149155396c8ac1b6ab62badb9d"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
RevertVmFromVmBackupAction.Result res = action.call()
```

6.2.1.1.16 RecoverVmBackupFromImageStoreBackupStorage)

API Request

URLs

```
PUT zstack/v1/vm-backups/{groupUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "recoverVmBackupFromImageStoreBackupStorage": {
    "srcBackupStorageUuid": "c63b10a638f6302caeabb7a806d087ad",
    "dstBackupStorageUuid": "7c7d653af1c531dfa04dabea3a085de5"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \

SyncVmBackupFromImageStoreBackupStorageAction.Result res = action.call()
```

6.2.1.1.18 CreateDatabaseBackup

API Request

URLs

```
POST zstack/v1/database-backups
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "zstack-db",
    "backupStorageUuid": "676c5945223647698fcf4da2fa46d1dd"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"name":"zstack-db","backupStorageUuid":"0c0f5fc523d8420a97a9be367f112b4a"}}' http://localhost:8080/zstack/v1/database-backups
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The name of the database backup.		3.0.0

Name	Type	Location	Description	Optional Value	Starting Version
description	String	body (contained in the params structure)	The detailed description of the backup.		3.0.0
backupStorageUuid	String	body (contained in the params structure)	The UUID of the backup storage.		3.0.0
resourceUuid	String	body (contained in the params structure)	Optional.		3.0.0
systemTags	List	body	Optional.		3.0.0
userTags	List	body	Optional.		3.0.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "7decf4a7cb7c41dabc57446df2784476",

#backupStorageRefs

Name	Type	Description	Starting Version
databaseBackupUuid	String		3.0.0
backupStorageUuid	String	The UUID of the backup storage.	3.0.0
installPath	String		3.0.0
exportUrl	String		3.0.0
status	String		3.0.0
createDate	Timestamp	The time when the backup was created.	3.0.0
lastOpDate	Timestamp	The time when the backup was last modified.	3.0.0

SDK Sample

Java SDK

```
CreateDatabaseBackupAction action = new CreateDatabaseBackupAction();
action.name = "zstack-db";
action.backupStorageUuid = "35c0d1e417d84bf498be201091f39c49";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateDatabaseBackupAction.Result res = action.call();
```

Python SDK

```
CreateDatabaseBackupAction action = CreateDatabaseBackupAction()
action.name = "zstack-db"
action.backupStorageUuid = "476870bf9c4241c8993340bd0703d0bf"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
CreateDatabaseBackupAction.Result res = action.call()
```

6.2.1.1.19 DeleteDatabaseBackup

API Request

URLs

```
DELETE zstack/v1/database-backups/{uuid}?
backupStorageUids={backupStorageUids}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/
database-backups/9caf0430ce473651ae7033e1a16a0097?
backupStorageUids=0c54ad64cd8d3ca1ba9d98864bb83571
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The UUID of the database backup.		3.0.0
backupStorageUids	List	url	Optional. The UUIDs of backup storage.		3.0.0
systemTags	List	body	Optional.		3.0.0
userTags	List	body	Optional.		3.0.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DeleteDatabaseBackupAction action = new DeleteDatabaseBackupAction();
action.uuid = "9caf0430ce473651ae7033e1a16a0097";
action.backupStorageUuids = asList("0c54ad64cd8d3ca1ba9d98864bb83571");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteDatabaseBackupAction.Result res = action.call();
```

Python SDK

```
DeleteDatabaseBackupAction action = DeleteDatabaseBackupAction()
action.uuid = "9caf0430ce473651ae7033e1a16a0097"
action.backupStorageUuids = [0c54ad64cd8d3ca1ba9d98864bb83571]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteDatabaseBackupAction.Result res = action.call()
```

6.2.1.1.20 QueryDatabaseBackup

API Request

URLs

```
GET zstack/v1/database-backups
GET zstack/v1/database-backups/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/database-backups?
q=uuid=9f5010336a233d6ebbd82594a6d56e7c
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/database-
backups/296a7da91333dd992d89bf30d9304ed
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryDatabaseBackup**, and pressing the Tab key.

API Response

Sample Response

```
{
  "inventories": [
    {

lastOpDate	Timestamp	The time when the backup was last modified.	3.0.0

SDK Sample

Java SDK

```
QueryDatabaseBackupAction action = new QueryDatabaseBackupAction();
action.conditions = asList("uuid=74b420b3e877354e832a900915aab41a");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryDatabaseBackupAction.Result res = action.call();
```

Python SDK

```
QueryDatabaseBackupAction action = QueryDatabaseBackupAction()
action.conditions = ["uuid=b11af605703231b4a898bed3fb7d94c0"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryDatabaseBackupAction.Result res = action.call()
```

6.2.1.1.21 SyncDatabaseBackup

API Request

URLs

```
PUT zstack/v1/database-backups/imageStore/{imageStoreUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "syncDatabaseBackup": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"syncDatabaseBackup":{}}' http://localhost:8080/zstack/v1/
database-backups/imageStore/2df92dfaba994da18c6a9801268d1703/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
imageStore Uuid	String	url			3.2.0
systemTags	List	body	Optional.		3.2.0
userTags	List	body	Optional.		3.2.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
SyncDatabaseBackupAction action = new SyncDatabaseBackupAction();
action.imageStoreUuid = "e0803f92a12b42688d20f68beef19588";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
SyncDatabaseBackupAction.Result res = action.call();
```

Python SDK

```
SyncDatabaseBackupAction action = SyncDatabaseBackupAction()
action.imageStoreUuid = "0de54b0b3067493f9461fc74906dfc54"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
SyncDatabaseBackupAction.Result res = action.call()
```

6.2.1.1.22 RecoverDatabaseFromBackup

API Request

URLs

```
PUT zstack/v1/database-backups/actions?uuid={uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "recoverDatabaseFromBackup": {
    "backupStorageUrl": "ssh://root:password@localhost:22/Cloud_bs",
    "backupInstallPath": "zstore://zsbak/0ed599ec519249489475112a058bb93a",
    "mysqlRootPassword": "password"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"recoverDatabaseFromBackup":{"backupStorageUrl":"ssh://root:password@localhost:22/Cloud_bs","backupInstallPath":"zstore://zsbak/0ed599ec519249489475112a058bb93a","mysqlRootPassword":"password"}}'
http://localhost:8080/zstack/v1/database-backups/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	Optional. The UUID of the database backup.		3.0.0

Name	Type	Location	Description	Optional Value	Starting Version
backupStorageUrl	String	body(contained in the recoverDatabaseFromBackup structure)	Optional. The URL of the backup storage.		3.0.0
backupInstallPath	String	body(contained in the recoverDatabaseFromBackup structure)	Optional. The storage path of the database backup.		3.0.0
mysqlRootPassword	String	body(contained in the recoverDatabaseFromBackup structure)	The root password of the MySQL database.		3.0.0
systemTags	List	body	Optional.		3.0.0
userTags	List	body	Optional.		3.0.0

API Response

Sample Response

```
{
  "logListenPort": 0.0
}
```

Name	Type	Description	Starting Version
logListenPort	int	The port that the browser listens to print logs in real time.	3.0.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error	3.0.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.0.0
description	String	The brief description of the error.	3.0.0
details	String	The details about the error.	3.0.0
elaboration	String	The reserved field. Default value: null.	3.0.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.0.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.0.0

SDK Sample

Java SDK

```
RecoverDatabaseFromBackupAction action = new RecoverDatabaseFromBackupAction();
action.backupStorageUrl = "ssh://root:password@localhost:22/Cloud_bs";
action.backupInstallPath = "zstore://zsbak/0ed599ec519249489475112a058bb93a";
action.mysqlRootPassword = "password";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
RecoverDatabaseFromBackupAction.Result res = action.call();
```

Python SDK

```
RecoverDatabaseFromBackupAction action = RecoverDatabaseFromBackupAction()
action.backupStorageUrl = "ssh://root:password@localhost:22/Cloud_bs"
action.backupInstallPath = "zstore://zsbak/0ed599ec519249489475112a058bb93a"
action.mysqlRootPassword = "password"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
RecoverDatabaseFromBackupAction.Result res = action.call()
```

6.2.1.1.23 ExportDatabaseBackupFromBackupStorage

API Request

URLs

```
PUT zstack/v1/database-backups/{databaseBackupUuid}/backup-storage/{backupStorageUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "exportDatabaseBackupFromBackupStorage": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"exportDatabaseBackupFromBackupStorage":
{}}' http://localhost:8080/zstack/v1/database-
backups/6dae84793fc53f5b82034dd9a44c554b/backup-storage/
cc9127f6af0e32c888044f49048788a1/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
backupStorageUuid	String	url	The UUID of the backup storage.		3.0.0
databaseBackupUuid	String	url	The UUID of the database backup.		3.0.0
systemTags	List	body	Optional.		3.0.0

Name	Type	Location	Description	Optional Value	Starting Version
userTags	List	body	Optional.		3.0.0

API Response

Sample Response

```
{
  "databaseBackupUrl": "http://127.0.0.1:8001/path/zstack-db-backup.gz"
}
```

Name	Type	Description	Starting Version
databaseBackupUrl	String	The URL of the exported database backup.	3.0.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error	3.0.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.0.0
description	String	The brief description of the error.	3.0.0
details	String	The details about the error.	3.0.0
elaboration	String	The reserved field. Default value: null.	3.0.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.0.0

Name	Type	Description	Starting Version
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.0.0

SDK Sample

Java SDK

```
ExportDatabaseBackupFromBackupStorageAction action = new ExportDatabaseBackupFromBackupStorageAction();
action.backupStorageUuid = "cc9127f6af0e32c888044f49048788a1";
action.databaseBackupUuid = "6dae84793fc53f5b82034dd9a44c554b";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
ExportDatabaseBackupFromBackupStorageAction.Result res = action.call();
```

Python SDK

```
ExportDatabaseBackupFromBackupStorageAction action = ExportDatabaseBackupFromBackupStorageAction()

ExportDatabaseBackupFromBackupStorageAction.Result res = action.call()
```

6.2.1.1.24 GetDatabaseBackupFromImageStore

API Request

URLs

```
GET zstack/v1/database-backups/image-store
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/database-backups/image-store?url=ssh://root:password@localhost:22/Cloud_bs&registryPort=8000.0
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
url	String	query	The URL of the backup storage.		3.0.0
registryPort	int	query	Optional. The port used to access the backup storage.		3.0.0
systemTags	List	query	Optional.		3.0.0
userTags	List	query	Optional.		3.0.0

API Response

Sample Response

```

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or	3.0.0

Name	Type	Description	Starting Version
		alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	
description	String	The brief description of the error.	3.0.0
details	String	The details about the error.	3.0.0
elaboration	String	The reserved field. Default value: null.	3.0.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.0.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.0.0

#infos

Name	Type	Description	Starting Version
id	String	The ID of the database backup image in the backup storage.	3.0.0
parent	String	The name of the parent image.	3.0.0
blobsum	String	The hash of the image .	3.0.0
created	Timestamp	The time when the image was created.	3.0.0
author	String	The author of the image.	3.0.0
arch	String	The OS structure of the image.	3.0.0
desc	String	The description of the image.	3.0.0

Name	Type	Description	Starting Version
size	Long	The actual size of the image.	3.0.0
virtualsize	Long	The virtualized size of the image.	3.0.0
name	String	The name of the image in the backup storage.	3.0.0

SDK Sample

Java SDK

```
GetDatabaseBackupFromImageStoreAction action = new GetDatabaseBackupFromImageStoreAction();
action.url = "ssh://root:password@localhost:22/Cloud_bs";
action.registryPort = 8000.0;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetDatabaseBackupFromImageStoreAction.Result res = action.call();
```

Python SDK

```
GetDatabaseBackupFromImageStoreAction action = GetDatabaseBackupFromImageStoreAction()
action.url = "ssh://root:password@localhost:22/Cloud_bs"
action.registryPort = 8000.0
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetDatabaseBackupFromImageStoreAction.Result res = action.call()
```

6.2.1.1.25 DeleteExportedDatabaseBackupFromBackupStorage

API Request

URLs

```
DELETE zstack/v1/exported-database-backup/{databaseBackupUuid}/backup-storage/{backupStorageUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X DELETE http://localhost:8080/zstack/v1/exported-
database-backup/341a599af82f3ecbab5d680e8dfb0276/backup-
storage/737f27cb664c31a594f71080d481dddf?
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
backupStorageUuid	String	url	The UUID of the backup storage.		3.0.0
databaseBackupUuid	String	url			3.0.0
systemTags	List	body	Optional.		3.0.0
userTags	List	body	Optional.		3.0.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteExportedDatabaseBackupFromBackupStorageAction action = new
DeleteExportedDatabaseBackupFromBackupStorageAction();
action.backupStorageUuid = "737f27cb664c31a594f71080d481dddf";
action.databaseBackupUuid = "341a599af82f3ecbab5d680e8dfb0276";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteExportedDatabaseBackupFromBackupStorageAction.Result res =
action.call();
```

Python SDK

```
DeleteExportedDatabaseBackupFromBackupStorageAction action =
DeleteExportedDatabaseBackupFromBackupStorageAction()
action.backupStorageUuid = "737f27cb664c31a594f71080d481dddf"
action.databaseBackupUuid = "341a599af82f3ecbab5d680e8dfb0276"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
DeleteExportedDatabaseBackupFromBackupStorageAction.Result res =
action.call()
```

6.2.1.1.26 SyncDatabaseBackupFromImageStoreBackupStorage

API Request

URLs

```
PUT zstack/v1/database-backups/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "syncDatabaseBackupFromImageStoreBackupStorage": {
    "srcBackupStorageUuid": "72ad4c5419d63f5aaf37faf985c95a65",

action.name = "job"
action.description = "description"
action.type = "startVm"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
CreateSchedulerJobGroupAction.Result res = action.call()
```

6.2.1.1.31 DeleteSchedulerJobGroup

API Request

URLs

```
DELETE zstack/v1/scheduler/jobgroups/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/scheduler/
jobgroups/8bf8b175d6ce337eb24cbe37d9fe9b82
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The UUID of the job group.		3.4.0
deleteMode	String	body	Optional. The mode under which the job group is deleted.		3.4.0
systemTags	List	body	Optional. The system tags.		3.4.0
userTags	List	body	Optional. The user tags.		3.4.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
}
```

SDK Sample

Java SDK

```
DeleteSchedulerJobGroupAction action = new DeleteSchedulerJobGr
oupAction();
action.uuid = "8bf8b175d6ce337eb24cbe37d9fe9b82";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteSchedulerJobGroupAction.Result res = action.call();
```

Python SDK

```
DeleteSchedulerJobGroupAction action = DeleteSchedulerJobGroupAction()
action.uuid = "8bf8b175d6ce337eb24cbe37d9fe9b82"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteSchedulerJobGroupAction.Result res = action.call()
```

6.2.1.1.32 UpdateSchedulerJobGroup

API Request

URLs

```
PUT zstack/v1/scheduler/jobgroups/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateSchedulerJobGroup": {
    "name": "Test2",
    "description": "new test"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
```

```
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateSchedulerJobGroup":
{"name":"Test2","description":"new test"}}'
http://localhost:8080/zstack/v1/scheduler/
jobgroups/4dc1dbf847d733fc98ee2998b5e0eca2/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The UUID of the job group.		3.4.0
name	String	body(contained in the updateSchedulerJobGroup structure)	Optional. The name of the job group.		3.4.0
description	String	body(contained in the updateSchedulerJobGroup structure)	Optional. The detailed description of the job group		3.4.0
state	String	body(contained in the updateSchedulerJobGroup structure)	Optional. The state of the job group.	- enable - disable	3.4.0
parameters	Map	body(contained in the updateSchedulerJobGroup structure)	Optional The parameters of the job group.		3.4.0
systemTags	List	body	Optional. The system tags.		3.4.0
userTags	List	body	Optional. The user tags.		3.4.0

API Response

Sample Response

```
{
  "inventory": {
```

```

    "uuid": "e344fd75079735369cbffda253cc173c",
    "name": "Test",
    "description": "create volume snapshot job",
    "createDate": "Nov 14, 2017 10:20:57 PM",
    "lastOpDate": "Nov 14, 2017 10:20:57 PM"
  }
}

```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error	3.4.0
inventory	SchedulerJobGroupInventory	See inventory	3.4.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.4.0
description	String	The brief description of the error.	3.4.0
details	String	The details about the error.	3.4.0
elaboration	String	The reserved field. Default value: null.	3.4.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.4.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.4.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The UUID of the job group.	3.4.0
name	String	The name of the job group.	3.4.0
description	String	The detailed description of the job group.	3.4.0
state	String	Optional. The state of the job group.	3.4.0
createDate	Timestamp	The time when the job group was created.	3.4.0
lastOpDate	Timestamp	The time when the job group was last modified.	3.4.0
jobData	String	The data of the jobs.	3.4.0
triggersUuid	List	The UUID of the trigger.	3.4.0

SDK Sample

Java SDK

```
UpdateSchedulerJobGroupAction action = new UpdateSchedulerJobGroupAction();
action.uuid = "4dc1dbf847d733fc98ee2998b5e0eca2";
action.name = "Test2";
action.description = "new test";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateSchedulerJobGroupAction.Result res = action.call();
```

Python SDK

```
UpdateSchedulerJobGroupAction action = UpdateSchedulerJobGroupAction()
action.uuid = "4dc1dbf847d733fc98ee2998b5e0eca2"
action.name = "Test2"
action.description = "new test"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
UpdateSchedulerJobGroupAction.Result res = action.call()
```

6.2.1.1.33 QuerySchedulerJobGroup

API Request

URLs

```
GET zstack/v1/scheduler/jobgroups
GET zstack/v1/scheduler/jobgroups/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \

Java SDK

```
QuerySchedulerJobGroupAction action = new QuerySchedulerJobGroupAction
();
action.conditions = asList("name=TestJobGroup", "state=Enabled");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QuerySchedulerJobGroupAction.Result res = action.call();
```

Python SDK

```
QuerySchedulerJobGroupAction action = QuerySchedulerJobGroupAction()
action.conditions = ["name=TestJobGroup", "state=Enabled"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QuerySchedulerJobGroupAction.Result res = action.call()
```

6.2.1.1.34 AddSchedulerJobsToSchedulerJobGroup

API Request

URLs

```
POST zstack/v1/scheduler/jobgroups/{schedulerJobGroupUuid}/job/
{schedulerJobUuids}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {},
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{}}' http://localhost:8080/zstack/v1/
scheduler/jobgroups/280d3a22ab363006b61b4a6c0318056f/job/
[ed43fba83eb63a1cacb38c113e2bd38a]
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
schedulerJobGroupUuid	String	url	The UUID of the job group		3.4.0
schedulerJobUuids	List	url	The UUID of the job.		3.4.0
systemTags	List	body	Optional. The system tags.		3.4.0
userTags	List	body	Optional. The user tags.		3.4.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample**Java SDK**

```
AddSchedulerJobsToSchedulerJobGroupAction action = new AddSchedulerJobsToSchedulerJobGroupAction();
action.schedulerJobGroupUuid = "280d3a22ab363006b61b4a6c0318056f";
```

```
action.schedulerJobUuids = asList("ed43fba83eb63a1cacb38c113e2bd38a");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
AddSchedulerJobsToSchedulerJobGroupAction.Result res = action.call();
```

Python SDK

```
AddSchedulerJobsToSchedulerJobGroupAction action = AddSchedulerJobsToSchedulerJobGroupAction()
action.schedulerJobGroupUuid = "280d3a22ab363006b61b4a6c0318056f"
action.schedulerJobUuids = [ed43fba83eb63a1cacb38c113e2bd38a]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
AddSchedulerJobsToSchedulerJobGroupAction.Result res = action.call()
```

6.2.1.1.35 RemoveSchedulerJobsFromSchedulerJobGroup

API Request

URLs

```
DELETE zstack/v1/scheduler/jobgroups/{schedulerJobGroupUuid}/job/{schedulerJobUuids}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \

SDK Sample

Java SDK

```
GetSchedulerExecutionReportAction action = new GetSchedulerExecutionReportAction();
action.startTime = 1.5856704E12;
action.intervalTimeUnit = "Month";
action.range = 4.0;
action.schedulerJobTypes = asList("vmBackup");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetSchedulerExecutionReportAction.Result res = action.call();
```

Python SDK

```
GetSchedulerExecutionReportAction action = GetSchedulerExecutionReportAction()
action.startTime = 1.5856704E12
action.intervalTimeUnit = "Month"
action.range = 4.0
action.schedulerJobTypes = [vmBackup]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
GetSchedulerExecutionReportAction.Result res = action.call()
```

6.2.2 CBT Operations

6.2.2.1 CreateCbtTask

API Request

URLs

```
POST zstack/v1/cbt-task/create
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "My CDP Task",
    "vmInstanceUuid": "89878e17496030ba9c062cbb18924335"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"name":"My CDP Task","vmInstanceUuid":"89878e17496030ba9c062cbb18924335"}}' http://localhost:8080/zstack/v1/cbt-task/create
```

Request Parameters

Name	Type	Location	Description	Valid Values	Starting Version
name	String	body (contained in the params structure)	The resource name.		5.3.28

Name	Type	Location	Description	Valid Values	Starting Version
description	String	body (contained in the params structure)	Optional. The resource description.		5.3.28
resourceUuids	List	body (contained in the params structure)	The resource UUID list.		5.3.28
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		5.3.28
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID list.		5.3.28
systemTags	List	body	Optional. The system tags.		5.3.28
userTags	List	body	Optional. The system tags.		5.3.28

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "b70f4160919c38748f908f489ba306ce",
    "name": "My Task",
    "status": "Created"
  }
}
```

Name	Type	Description	Start Version
success	boolean		5.3.28
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error	5.3.28

Name	Type	Description	Start Version
inventory	CbtTaskInventory	See inventory	5.3.28

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	5.3.28
description	String	The brief description of the error.	5.3.28
details	String	The details about the error.	5.3.28
elaboration	String	The reserved field. Default value: null.	5.3.28
opaque	LinkedHashMap	The reserved field. Default value: null.	5.3.28
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	5.3.28

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	5.3.28
name	String	The resource name.	5.3.28
description	String	The resource description.	5.3.28
createDate	Timestamp	The creation time.	5.3.28
lastOpDate	Timestamp	The last operation time.	5.3.28
status	CbtTaskStatus	See status	5.3.28

#status

Name	Type	Description	Starting Version
Created	CbtTaskStatus	The task is created.	5.3.28
Starting	CbtTaskStatus	The task is starting.	5.3.28
Running	CbtTaskStatus	The task is running.	5.3.28
Stopped	CbtTaskStatus	The task is stopped.	5.3.28
Failed	CbtTaskStatus	The task failed.	5.3.28

SDK Sample

Java SDK

```
CreateCbtTaskAction action = new CreateCbtTaskAction();
action.name = "My CDP Task";
action.vmInstanceId = "89878e17496030ba9c062cbb18924335";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateCbtTaskAction.Result res = action.call();
```

Python SDK

```
CreateCbtTaskAction action = CreateCbtTaskAction()
action.name = "My CDP Task"
action.vmInstanceId = "89878e17496030ba9c062cbb18924335"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CreateCbtTaskAction.Result res = action.call()
```

6.2.2.2 DeleteCbtTask**API Request**

URLs

```
DELETE zstack/v1/cbt-task/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/cbt-
task/7017b8d5bef63877a528a5f56517c829
```

Request Parameters

Name	Type	Location	Description	Valid Values	Starting Version
uuid	String	url	The resource UUID.		5.3.28
force	boolean	body	Optional.		5.3.28
deleteMode	String	body	Optional. The deletion mode (Permissive / Enforcing, Permissive).		5.3.28
systemTags	List	body	Optional. The system tags.		5.3.28
userTags (可选)	List	body	Optional. The user tags.		5.3.28

API返回

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteCbtTaskAction action = new DeleteCbtTaskAction();
action.uuid = "7017b8d5bef63877a528a5f56517c829";
action.force = false;
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteCbtTaskAction.Result res = action.call();
```

Python SDK

```
DeleteCbtTaskAction action = DeleteCbtTaskAction()
action.uuid = "7017b8d5bef63877a528a5f56517c829"
action.force = false
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
DeleteCbtTaskAction.Result res = action.call()
```

6.2.2.3 QueryCbtTask

API Request

URLs

```
GET zstack/v1/cbt-task
```

```
GET zstack/v1/cbt-task/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/cbt-task?
q=uuid=d6c3daab1c9b3274b5fc4088bd3e51ad
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/cbt-task/
cf426711ed6538069d2d4d6d34d5e60a
```

Queryable Fields

ou can check all queryable fields and resource names that can be queried across tables by using zstack-cli, entering **QueryCbtTask**, and pressing the Tab key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "uuid": "103f6f8dc6dc3f8b82c1e1923dc751e0",
      "name": "My Task",
      "status": "Running"
    }
  ]
}
```

Name	Type	Description	Starting Version

SDK Sample

Java SDK

```
QueryCbtTaskAction action = new QueryCbtTaskAction();
action.conditions = asList("uuid=bd8fa811d9c234ceada09446fa085967");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryCbtTaskAction.Result res = action.call();
```

Python SDK

```
QueryCbtTaskAction action = QueryCbtTaskAction()
action.conditions = ["uuid=0449908917ce338bba71c107848b7c5c"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
QueryCbtTaskAction.Result res = action.call()
```

6.2.2.4 EnableCbtTask

API Request

URLs

```
POST zstack/v1/cbt-task/enable/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "bitmapName": ""
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"bitmapName":""}}'
http://localhost:8080/zstack/v1/cbt-task/enable/
adced083701e39869540ee2af82da0da
```

Request Parameters

Name	Type	Location	Description	Valid Values	Starting Version
uuid	String	url	The resource UUID.		5.3.28
bitmapName	String	body (contained in the params structure).	Optional		5.3.28

Name	Type	Location	Description	Valid Values	Starting Version
systemTags	List	body	Optional. The system tags.		5.3.28
userTags	List	body	Optional. The user tags.		5.3.28

API Response

Sample Response

```
{
  "volumeCbtBackupInfos": [
    {}
  ]
}
```

Name	Type	Description	Starting Version
success	boolean		5.3.28
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error	5.3.28
inventory	CbtTaskInventory	See inventory	5.3.28

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	5.3.28
description	String	The brief description of the error.	5.3.28
details	String	The details about the error.	5.3.28
elaboration	String	The reserved field. Default value: null.	5.3.28

Name	Type	Description	Starting Version
opaque	LinkedHashMap	The reserved field. Default value: null.	5.3.28
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	5.3.28

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	5.3.28
name	String	The resource name.	5.3.28
description	String	The resource description.	5.3.28
createDate	Timestamp	The creation time.	5.3.28
lastOpDate	Timestamp	The last operation time.	5.3.28
status	CbtTaskStatus	See status	5.3.28

#status

Name	Type	Description	Starting Version

Running	CbtTaskStatus	The task is running.	5.3.28
Stopped	CbtTaskStatus	The task is stopped.	5.3.28
Failed	CbtTaskStatus	The task failed.	5.3.28

SDK Sample

Java SDK

```
EnableCbtTaskAction action = new EnableCbtTaskAction();
action.uuid = "adced083701e39869540ee2af82da0da";
action.bitmapName = "";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
EnableCbtTaskAction.Result res = action.call();
```

Python SDK

```
EnableCbtTaskAction action = EnableCbtTaskAction()
action.uuid = "adced083701e39869540ee2af82da0da"
action.bitmapName = ""
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
EnableCbtTaskAction.Result res = action.call()
```

6.2.2.5 DisableCbtTask

API Request

URLs

```
POST zstack/v1/cbt-task/disable/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "force": false
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"force":false}}' http://localhost:8080/zstack/
v1/cbt-task/disable/5a86262807b4363e95f2e57d2970d189
```

Request Parameters

Name	Type	Location	Description	Valid Values	Starting Version
uuid	String	url	The resource UUID.		5.3.28

Name	Type	Location	Description	Valid Values	Starting Version
force	boolean	body (contained in the params structure).	Optional. Forcible or not.		5.3.28
systemTags	List	body	Optional. The system tags.		5.3.28
userTags	List	body	Optional. The user tags.		5.3.28

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "5ca9c15a50c53f0dac359a64841d7b2b",
    "name": "My Task",
    "status": "Stopped"
  }
}
```

Name	Type	Description	Starting Version
success	boolean		5.3.28
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error	5.3.28
inventory	CbtTaskInventory	See inventory	5.3.28

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	5.3.28

Name	Type	Description	Starting Version
description	String	The brief description of the error.	5.3.28
details	String	The details about the error.	5.3.28
elaboration	String	The reserved field. Default value: null.	5.3.28
opaque	LinkedHashMap	The reserved field. Default value: null.	5.3.28
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	5.3.28

name	String	The resource name.	5.3.28
description	String	The resource description.	5.3.28
createDate	Timestamp	The creation time.	5.3.28
lastOpDate	Timestamp	The last operation time.	5.3.28
status	CbtTaskStatus	See status	5.3.28

#status

Name	Type	Description	Starting Version
Created	CbtTaskStatus	The task is created.	5.3.28
Starting	CbtTaskStatus	The task is starting.	5.3.28
Running	CbtTaskStatus	The task is running.	5.3.28
Stopped	CbtTaskStatus	The task is stopped.	5.3.28
Failed	CbtTaskStatus	The task failed.	5.3.28

SDK Sample

Java SDK

```
DisableCbtTaskAction action = new DisableCbtTaskAction();
action.uuid = "5a86262807b4363e95f2e57d2970d189";
action.force = false;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DisableCbtTaskAction.Result res = action.call();
```

Python SDK

```
DisableCbtTaskAction action = DisableCbtTaskAction()
action.uuid = "5a86262807b4363e95f2e57d2970d189"
action.force = false
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DisableCbtTaskAction.Result res = action.call()
```

6.2.2.6 ExportNbdVolumes

API Request

URLs

```
POST zstack/v1/cbt-task/exportvolume
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "volumeUuids": [
      "8d7de4e1c3b73fc49772b0fef78b0fc7"
    ],
    "vmInstanceUuid": "7d8c1dec326c3230be08d3c82fb7a476",
    "force": false
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X POST -d '{"params":{"volumeUuids":
["8d7de4e1c3b73fc49772b0fef78b0fc7"],"vmInstanceUuid":"7d8c1dec326c3230be08d3c82f
http://localhost:8080/zstack/v1/cbt-task/exportvolume
```

Request Parameters

Name	Type	Location	Description	Valid Values	Starting Version
volumeUuids	List	body (contained in the params structure).	The volume UUID list.		5.3.28
vmInstanceUuid	String	body (contained in the params structure).	The VM UUID list.		5.3.28
systemTags	List	body	Optional. The system tags.		5.3.28
userTags	List	body	Optional. The user tags.		5.3.28
force	boolean	body (contained in the params structure).	Optional. Forcible or not.		5.3.28

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
ExportNbdVolumesAction action = new ExportNbdVolumesAction();
action.volumeUuids = asList("8d7de4e1c3b73fc49772b0fef78b0fc7");
action.vmInstanceUuid = "7d8c1dec326c3230be08d3c82fb7a476";
action.force = false;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
ExportNbdVolumesAction.Result res = action.call();
```

Python SDK

```
ExportNbdVolumesAction action = ExportNbdVolumesAction()
action.volumeUuids = [8d7de4e1c3b73fc49772b0fef78b0fc7]
action.vmInstanceUuid = "7d8c1dec326c3230be08d3c82fb7a476"
action.force = false
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
ExportNbdVolumesAction.Result res = action.call()
```

6.2.2.7 UnexportNbdVolumes

API Request

URLs

```
POST zstack/v1/cbt-task/unexportvolume
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "volumeUuids": [
      "82eaf8972ece3e228b6f75f61f8749d9"
    ],

```

```
UnexportNbdVolumesAction.Result res = action.call()
```

6.2.3 Continuous Data Protection (CDP)

持续数据保护（CDP）服务以单独的功能模块形式提供，需提前购买持续数据保护（CDP）模块许可证，且需在购买云平台许可证基础上使用，不可单独使用。

6.2.3.1 CDP Operations

6.2.3.1.1 CreateCdpPolicy

API Request

URLs

```
POST zstack/v1/cdp-backup-storage/policy
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "MyCdpPolicyName",
    "description": "MyCdpDescription",
    "hourlyRpSinceDay": 3.0,
    "dailyRpSinceDay": 7.0,
    "expireTimeInDay": 30.0,
    "fullBackupIntervalInDay": 2.0,
    "recoveryPointPerSecond": 5.0
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"name": "MyCdpPolicyName", "description": "MyCdpDescription", "hourlyRpSinceDay": 3.0
http://localhost:8080/zstack/v1/cdp-backup-storage/policy
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The name of the resource.		4.5.0
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		4.5.0
retentionTimePerDay	Integer	body (contained in the params structure)	The retention time of the recovery points.		4.5.0
recoveryPointPerSecond	Integer	body (contained in the params structure)	The retention interval of the recovery points.		4.5.0
hourlyRecoveryPointSinceDay	Integer	body (contained in the params structure)	The day from which to keep a recovery point hourly.		4.5.0
dailyRecoveryPointSinceDay	Integer	body (contained in the params structure)	The day from which to keep a recovery point per day.		4.5.0
expireTimeInDay	Integer	body (contained in the params structure)	The valid time of the backup data.		4.5.0
fullBackupIntervalInDay	Integer	body (contained in the params structure)	The interval of the full backup.		4.5.0
resourceUuid	String	body (contained in the params structure)	Optional. The UUID of the resource.		4.5.0

Name	Type	Location	Description	Optional Value	Starting Version
tagUuids	List	body (contained in the params structure)	Optional. The UUID list of the tags.		4.5.0
systemTags	List	body	Optional. The system tags.		4.5.0
userTags	List	body	Optional. The user tags.		4.5.0

API Response

Sample Response

```
{
  "inventory": {
    "name": "MyCdpPolicyName",
    "description": "MyCdpDescription",
    "retentionTimePerDay": 7.0,
    "recoveryPointPerSecond": 5.0
  }
}
```

Name	Type	Description	Starting Version
success	boolean	Succeeded.	4.5.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.5.0
inventory	CdpPolicyInventory	See inventory .	4.5.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.5.0

Name	Type	Description	Starting Version
description	String	The brief description of the error.	4.5.0
details	String	The details about the error.	4.5.0
elaboration	String	The reserved field. Default value: null.	4.5.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.5.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.5.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The UUID of the CDP policy.	4.5.0
name	String	The name of the CDP policy.	4.5.0
description	String	The detailed description of the CDP policy.	4.5.0
retentionTimePerDay	Integer	The retention time for the recovery points.	4.5.0
recoveryPointPerSecond	Integer	The retention interval of the recovery points.	4.5.0
createDate	Timestamp	The time when the CDP policy is created.	4.5.0
lastOpDate	Timestamp	The time when the CDP policy is last modified.	4.5.0
state	CdpPolicyState	See state .	4.5.0

#state

Name	Type	Description	Starting Version
Enabled	CdpPolicyState	The CDP policy is enabled.	4.5.0
Disabled	CdpPolicyState	The CDP policy is disabled.	4.5.0

SDK Sample

Java SDK

```
CreateCdpPolicyAction action = new CreateCdpPolicyAction();
action.name = "MyCdpPolicyName";
action.description = "MyCdpDescription";
action.hourlyRpSinceDay = 3.0;
action.dailyRpSinceDay = 7.0;
action.expireTimeInDay = 30.0;
action.fullBackupIntervalInDay = 2.0;
action.recoveryPointPerSecond = 5.0;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateCdpPolicyAction.Result res = action.call();
```

Python SDK

```
CreateCdpPolicyAction action = CreateCdpPolicyAction()
action.name = "MyCdpPolicyName"
action.description = "MyCdpDescription"
action.hourlyRpSinceDay = 3.0
action.dailyRpSinceDay = 7.0
action.expireTimeInDay = 30.0
action.fullBackupIntervalInDay = 2.0
action.recoveryPointPerSecond = 5.0
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CreateCdpPolicyAction.Result res = action.call()
```

6.2.3.1.2 DeleteCdpPolicy

API Request

URLs

```
DELETE zstack/v1/cdp-backup-storage/policy/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X DELETE http://localhost:8080/zstack/v1/cdp-backup-storage/
policy/6429f8a631993740b1c96e24bb64eca6
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The UUID of the resource.		4.5.0
deleteMode	String	body	Optional. The delete mode.	• Permissive • Enforcing • Permissive	4.5.0
systemTags	List	body	Optional. The system tags.		4.5.0
userTags	List	body	Optional. The user tags.		4.5.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteCdpPolicyAction action = new DeleteCdpPolicyAction();
action.uuid = "6429f8a631993740b1c96e24bb64eca6";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteCdpPolicyAction.Result res = action.call();
```

Python SDK

```
DeleteCdpPolicyAction action = DeleteCdpPolicyAction()
action.uuid = "6429f8a631993740b1c96e24bb64eca6"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
DeleteCdpPolicyAction.Result res = action.call()
```

6.2.3.1.3 QueryCdpPolicy

API Request

URLs

```
GET zstack/v1/cdp-backup-storage/policy
GET zstack/v1/cdp-backup-storage/policy/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/cdp-backup-storage/policy?
q=uuid=c58c597901553c81bc469ebdc0324340
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/cdp-backup-storage/
policy/3cb711db1fbc3d80954ff45590fe11fc
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryVolumeBackup**, and pressing the Tab key.

API Response

Sample Response

```
{
  "inventories": [
    {

6.2.3.1.6 DeleteCdpTask

API Request

URLs

```
DELETE zstack/v1/cdp-task/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/cdp-
task/1b6124362d023f0fb13f20923e2075d7
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The UUID of the resource.		4.5.0
deleteMode	String	body	Optional. The delete mode.	• Permissive • Enforcing • Permissive	4.5.0
systemTags	List	body	Optional. The system tags.		4.5.0
userTags	List	body	Optional. The user tags.		4.5.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",

  }
}
```

```
}
```

SDK Sample

Java SDK

```
DeleteCdpTaskAction action = new DeleteCdpTaskAction();
action.uuid = "1b6124362d023f0fb13f20923e2075d7";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteCdpTaskAction.Result res = action.call();
```

Python SDK

```
DeleteCdpTaskAction action = DeleteCdpTaskAction()
action.uuid = "1b6124362d023f0fb13f20923e2075d7"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteCdpTaskAction.Result res = action.call()
```

6.2.3.1.7 QueryCdpTask

API Request

URLs

```
GET zstack/v1/cdp-task
GET zstack/v1/cdp-task/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/cdp-task?
q=uuid=ba57edb98e983115804b74bc47e968e1
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/cdp-
task/8249deb879fa303b841560bf3cbd5113
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryVolumeBackup**, and pressing the Tab key.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"protectVmInstanceRecoveryPoint":
{"groupId":1.0,"description":"My Awesome
RP"}}' http://localhost:8080/zstack/v1/vm-
instances/8242bb6842e73987a632354acfc239ec/protect-recovery-point
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vmInstanceUuid	String	url	The UUID of the VM instance.		4.5.0
groupId	long	body (contained in	The group ID of the		4.5.0

Name	Type	Location	Description	Optional Value	Starting Version
		the params structure)	recovery points.		
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		4.5.0
systemTags	List	body	Optional. The system tags.		4.5.0
userTags	List	body	Optional. The user tags.		4.5.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
ProtectVmInstanceRecoveryPointAction action = new ProtectVmInstanceRecoveryPointAction();
action.vmInstanceId = "8242bb6842e73987a632354acfc239ec";
action.groupId = 1.0;
action.description = "My Awesome RP";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
ProtectVmInstanceRecoveryPointAction.Result res = action.call();
```

Python SDK

```
ProtectVmInstanceRecoveryPointAction action = ProtectVmInstanceRecoveryPointAction()
action.vmInstanceId = "8242bb6842e73987a632354acfc239ec"
action.groupId = 1.0
action.description = "My Awesome RP"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
ProtectVmInstanceRecoveryPointAction.Result res = action.call()
```

6.2.3.1.12 GetVmInstanceProtectedRecoveryPoints

API Request

URLs

```
GET zstack/v1/vm-instances/{uuid}/protected-recovery-points
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/vm-instances/
f71a2ffeec113d8e840a6808d09d1ca8/protected-recovery-points?
limit=1000.0&start=0.0
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The UUID of the resource.		4.5.0
limit	Integer	query	Optional. The maximum number of returned records.		4.5.0
start	Integer	query	Optional. The first record to query.		4.5.0
systemTags	List	query	Optional. The system tags.		4.5.0
userTags	List	query	Optional. The user tags.		4.5.0

API Response

Sample Response

```
{
```

```

elaboration	String	The reserved field. Default value: null.	4.5.0

Name	Type	Description	Starting Version
opaque	LinkedHashMap	The reserved field. Default value: null.	4.5.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.5.0

SDK Sample

Java SDK

```
GetVmInstanceProtectedRecoveryPointsAction action = new GetVmInstanceProtectedRecoveryPointsAction();
action.uuid = "f71a2ffeec113d8e840a6808d09d1ca8";
action.limit = 1000.0;
action.start = 0.0;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetVmInstanceProtectedRecoveryPointsAction.Result res = action.call();
```

Python SDK

```
GetVmInstanceProtectedRecoveryPointsAction action = GetVmInstanceProtectedRecoveryPointsAction()
action.uuid = "f71a2ffeec113d8e840a6808d09d1ca8"
action.limit = 1000.0
action.start = 0.0
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetVmInstanceProtectedRecoveryPointsAction.Result res = action.call()
```

6.2.3.1.13 UnprotectVmInstanceRecoveryPoint

API Request

URLs

```
PUT zstack/v1/vm-instances/{vmInstanceUuid}/unprotect-recovery-point
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "unprotectVmInstanceRecoveryPoint": {
    "groupId": 1.0
  },
}
```

```
"systemTags": [],
"userTags": []
}
```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"unprotectVmInstanceRecoveryPoint":
{"groupId":1.0}}' http://localhost:8080/zstack/v1/vm-
instances/05beea45590e3ea5ac08d81dba36f51f/unprotect-recovery-point
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vmInstance Uuid	String	url	The UUID of the VM instance.		4.5.0
groupId	long	body (contained in the params structure)	The group ID of the recovery points.		4.5.0
systemTags (optional)	List	body	The system tags.		4.5.0
userTags (optional)	List	body	The user tags.		4.5.0

API Response**Sample Response**

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
UnprotectVmInstanceRecoveryPointAction action = new UnprotectVmInstanceRecoveryPointAction();
action.vmInstanceUuid = "05beea45590e3ea5ac08d81dba36f51f";
action.groupId = 1.0;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UnprotectVmInstanceRecoveryPointAction.Result res = action.call();
```

Python SDK

```
UnprotectVmInstanceRecoveryPointAction action = UnprotectVmInstanceRecoveryPointAction()
action.vmInstanceUuid = "05beea45590e3ea5ac08d81dba36f51f"
action.groupId = 1.0
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UnprotectVmInstanceRecoveryPointAction.Result res = action.call()
```

6.2.3.1.14 CreateVmFromCdpBackup

API Request

URLs

```
PUT zstack/v1/cdp-backups/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "createVmFromCdpBackup": {
    "name": "vm1",
    "groupId": 224.0,
    "cdpTaskUuid": "d2cb3e8626e1357aa022e05f86162987",

  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"revertVmFromCdpBackup":
{"backupStorageUuid":"13680e129d053ee092513efebf1ce00a","groupId":1.0,"useExistin
http://localhost:8080/zstack/v1/cdp-backups/
faa5f80004b4393dbc59b91ab5a286b7/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vmInstanceUuid	String	url	The UUID of the VM instance.		4.5.0
backupStorageUuid	String	body (contained in the params structure)	The UUID of the backup storage.		4.5.0
groupId	long	body (contained in the params structure)	The group ID of the recovery points.		4.5.0
systemTags	List	body	Optional. The system tags.		4.5.0
userTags	List	body	Optional. The user tags.		4.5.0
primaryStorageUuidForRootVolume	String	body (contained in the params structure)	Optional. The UUID of the primary storage for new root volume.		4.5.0

Name	Type	Location	Description	Optional Value	Starting Version
primaryStorageUuidForDataVolume	String	body (contained in the params structure)	Optional. The UUID of the primary storage for new data volume.		4.5.0
hostUuid	String	body (contained in the params structure)	Optional. The UUID of the host.		4.5.0
useExistingVolume	boolean	body (contained in the params structure)	Optional. Use the recover data to overwrite existing volume or not.		4.5.0
recoverBandwidth	long	body (contained in the params structure)	Optional. The recover bandwidth.		4.5.0

API Response

Sample Response

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
RevertVmFromCdpBackupAction action = new RevertVmFromCdpBackupAction
();
action.vmInstanceUuid = "faa5f80004b4393dbc59b91ab5a286b7";
action.backupStorageUuid = "13680e129d053ee092513efebf1ce00a";
action.groupId = 1.0;
action.useExistingVolume = true;
action.recoverBandwidth = 0.0;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
RevertVmFromCdpBackupAction.Result res = action.call();
```

Python SDK

```
RevertVmFromCdpBackupAction action = RevertVmFromCdpBackupAction()
action.vmInstanceUuid = "faa5f80004b4393dbc59b91ab5a286b7"
action.backupStorageUuid = "13680e129d053ee092513efebf1ce00a"
action.groupId = 1.0
action.useExistingVolume = true
action.recoverBandwidth = 0.0
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
RevertVmFromCdpBackupAction.Result res = action.call()
```

6.2.3.1.16 DeleteCdpTaskData

API Request

URLs

```
POST zstack/v1/cdp-task/{uuid}/data
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{}}' http://localhost:8080/zstack/v1/cdp-task/06a058ba3bb43e91afe212bc710c559e/data
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The UUID of the resource.		4.5.0
systemTags	List	body	Optional. The system tags.		4.5.0
userTags	List	body	Optional. The user tags.		4.5.0

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteCdpTaskDataAction action = new DeleteCdpTaskDataAction();
action.uuid = "06a058ba3bb43e91afe212bc710c559e";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteCdpTaskDataAction.Result res = action.call();
```

Python SDK

```
DeleteCdpTaskDataAction action = DeleteCdpTaskDataAction()
action.uuid = "06a058ba3bb43e91afe212bc710c559e"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
DeleteCdpTaskDataAction.Result res = action.call()
```

6.2.3.1.17 GetVmInstanceRecoveryPoints

API Request

URLs

```
GET zstack/v1/vm-instances/{uuid}/recovery-points
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/vm-instances/
e2e9f8f2184135378b883036673d1780/recovery-points?
startTime=2021-06-25T15:36:16%2b08:00&limit=1000.0&start=0.0
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The UUID of the resource.		4.5.0
startTime	String	query	Optional. The start time to query.		4.5.0
endTime	String	query	Optional. The end time to query.		4.5.0
scale	String	query	Optional. The unit of time to query the recovery points.	- minute - hour - day	4.5.0
limit	Integer	query	Optional. The maximum number of returned records.		4.5.0

Name	Type	Location	Description	Optional Value	Starting Version
start	Integer	query	Optional. The first record to query.		4.5.0
systemTags	List	query	Optional. The system tags.		4.5.0
userTags	List	query	Optional. The user tags.		4.5.0

API Response

Sample Response

```
{
  "recoveryPoints": {
    "db058d634c403ffd9b55d4af14090c4b": [
      {
        "id": 2.0,
        "grpId": 1.0,
        "size": 196608.0,
        "volId": "db058d634c403ffd9b55d4af14090c4b",
        "ts": "2021-06-29T19:49:47+08:00"
      }
    ],
    "9092ed3354fe39ea854f2e22e0346223": [
      {
        "id": 1.0,
        "grpId": 1.0,
        "size": 851968.0,
        "volId": "9092ed3354fe39ea854f2e22e0346223",
        "ts": "2021-06-29T19:49:45+08:00"
      }
    ]
  }
}
```

Name	Type	Description	Starting Version
recoveryPoints	Map	The list of CDP recovery points.	4.5.0
success	boolean	Succeeded.	4.5.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.5.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.5.0
description	String	The brief description of the error.	4.5.0
details	String	The details about the error.	4.5.0
elaboration	String	The reserved field. Default value: null.	4.5.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.5.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.5.0

SDK Sample

Java SDK

```
GetVmInstanceRecoveryPointsAction action = new GetVmInstanceRecover
yPointsAction();
action.uuid = "e2e9f8f2184135378b883036673d1780";
action.startTime = "2021-06-25T15:36:16+08:00";
action.limit = 1000.0;
action.start = 0.0;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetVmInstanceRecoveryPointsAction.Result res = action.call();
```

Python SDK

```
GetVmInstanceRecoveryPointsAction action = GetVmInstanceRecover
yPointsAction()
action.uuid = "e2e9f8f2184135378b883036673d1780"
action.startTime = "2021-06-25T15:36:16+08:00"
action.limit = 1000.0
action.start = 0.0
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
GetVmInstanceRecoveryPointsAction.Result res = action.call()
```

6.2.3.1.18 MountVmInstanceRecoveryPoint

API Request

URLs

```
POST zstack/v1/cdp-backup-storage/mount-recovery-point
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "vmUuid": "b21d235bb4683fa88c9cd0ac660b1b45",
    "groupId": 1.0,
    "https": true
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"vmUuid":"b21d235bb4683fa88c9cd0ac660b1b45","groupId":1.0,"https":true}}'
http://localhost:8080/zstack/v1/cdp-backup-storage/mount-recovery-
point
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vmUuid	String	body (contained in the params structure)	The UUID of the VM instance.		4.5.0

Name	Type	Location	Description	Optional Value	Starting Version
groupId	long	body (contained in the params structure)	The group ID of the recovery points.		4.5.0
systemTags	List	body	Optional. The system tags.		4.5.0
userTags	List	body	Optional. The user tags.		4.5.0
https	boolean	body (contained in the params structure)	Optional. Use https or not.		4.5.0

API Response

Sample Response

```
{
  "resourcePath": "http://cdp-storage-server/some-path"
}
```

Name	Type	Description	Starting Version
resourcePath	String	The resource path where the recovery point was successfully mounted.	4.5.0
failedVolumes	Map	The list of volumes that failed to mount recovery points.	4.5.0
success	boolean	Succeeded.	4.5.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.5.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	4.5.0
description	String	The brief description of the error.	4.5.0
details	String	The details about the error.	4.5.0
elaboration	String	The reserved field. Default value: null.	4.5.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.5.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.5.0

SDK Sample

Java SDK

```
MountVmInstanceRecoveryPointAction action = new MountVmInstanceRecoveryPointAction();
action.vmUuid = "b21d235bb4683fa88c9cd0ac660b1b45";
action.groupId = 1.0;
action.https = true;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
MountVmInstanceRecoveryPointAction.Result res = action.call();
```

Python SDK

```
MountVmInstanceRecoveryPointAction action = MountVmInstanceRecoveryPointAction()
action.vmUuid = "b21d235bb4683fa88c9cd0ac660b1b45"
action.groupId = 1.0
action.https = true
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
MountVmInstanceRecoveryPointAction.Result res = action.call()
```

6.2.3.1.19 UnmountVmInstanceRecoveryPoint

API Request

URLs

```
POST zstack/v1/cdp-backup-storage/unmount-recovery-point
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "vmUuid": "1cd2fd6c1c6b39b3b7cb08a58cb448bc",
    "groupId": 1.0
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"vmUuid":"1cd2fd6c1c6b39b3b7cb08a58cb448bc","groupId":1.0}}' http://
localhost:8080/zstack/v1/cdp-backup-storage/unmount-recovery-point
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vmUuid	String	body (contained in the params structure)	The UUID of the VM instance.		4.5.0
groupId	long	body (contained in	The group ID of the		4.5.0

Name	Type	Location	Description	Optional Value	Starting Version
		the params structure)	recovery points.		
systemTags	List	body	Optional. The system tags.		4.5.0
userTags	List	body	Optional. The user tags.		4.5.0

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
UnmountVmInstanceRecoveryPointAction action = new UnmountVmInstanceRecoveryPointAction();
action.vmUuid = "1cd2fd6c1c6b39b3b7cb08a58cb448bc";
action.groupId = 1.0;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UnmountVmInstanceRecoveryPointAction.Result res = action.call();
```

Python SDK

```
UnmountVmInstanceRecoveryPointAction action = UnmountVmInstanceRecoveryPointAction()
action.vmUuid = "1cd2fd6c1c6b39b3b7cb08a58cb448bc"
action.groupId = 1.0
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
UnmountVmInstanceRecoveryPointAction.Result res = action.call()
```

6.2.3.1.20 GetCdpBackupStorageRequirement

API Request

URLs

```
GET zstack/v1/cdp-backup-storage/{backupStorageUuid}/requirement
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/cdp-backup-storage/
ce44cb9ea12c354495fc6b4313fc90de/requirement?limit=1000&start=0
```

Request Parameters

Name	Type	Location	Description	Valid Values	Starting Version
backupStorageUuid	String	url	The backup storage UUID.		5.1.4
limit	Integer	query	Optional.		5.1.4
start	Integer	query	Optional.		5.1.4
systemTags	List	query	Optional. The system tags.		5.1.4
userTags	List	query	Optional. The user tags.		5.1.4

API Response

Sample Response

```
{
  "nextStep": "None",
  "required": {
    "qemuVersion": "6.2.0"
  },
  "current": {
    "cdpVersion": "cdp"
  }
}
```

}

Name	Type	Description	Starting Version
required	Map	The conditions required.	5.1.4
current	Map	The current conditions.	5.1.4
success	boolean	Whether the task is successful.	5.1.4
nextStep	String	The next step.	5.1.4
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	5.1.4

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	5.1.4
description	String	The brief description of the error.	5.1.4
details	String	The details about the error.	5.1.4
elaboration	String	The reserved field. Default value: null.	5.1.4
opaque	LinkedHashMap	The reserved field. Default value: null.	5.1.4
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	5.1.4

SDK Sample

Java SDK

```
GetCdpBackupStorageRequirementAction action = new GetCdpBackupStorageRequirementAction();
action.backupStorageUuid = "ce44cb9ea12c354495fc6b4313fc90de";
action.limit = 1000;
action.start = 0;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetCdpBackupStorageRequirementAction.Result res = action.call();
```

Python SDK

```
GetCdpBackupStorageRequirementAction action = GetCdpBackupStorageRequirementAction()
action.backupStorageUuid = "ce44cb9ea12c354495fc6b4313fc90de"
action.limit = 1000
action.start = 0
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetCdpBackupStorageRequirementAction.Result res = action.call()
```

6.2.3.1.21 UpgradeBackupStorageCdpTasks

API Request

URLs

```
PUT zstack/v1/cdp-task/upgrade/{backupStorageUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "upgradeBackupStorageCdpTasks": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X PUT -d '{"upgradeBackupStorageCdpTasks":
{}}' http://localhost:8080/zstack/v1/cdp-task/
upgrade/618da5c98de33bb0bc2434a80f0ab889/actions
```

Request Parameters

Name	Type	Location	Description	Valid Values	Starting Version
backupStorageUuid	String	url	The backup storage UUID.		5.1.4
systemTags (可选)	List	body	The system tags.		5.1.4
userTags (可选)	List	body	The user tags.		5.1.4

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
UpgradeBackupStorageCdpTasksAction action = new UpgradeBackupStorageCdpTasksAction();
action.backupStorageUuid = "618da5c98de33bb0bc2434a80f0ab889";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpgradeBackupStorageCdpTasksAction.Result res = action.call();
```

Python SDK

```
UpgradeBackupStorageCdpTasksAction action = UpgradeBackupStorageCdpTasksAction()
action.backupStorageUuid = "618da5c98de33bb0bc2434a80f0ab889"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
UpgradeBackupStorageCdpTasksAction.Result res = action.call()
```

6.2.3.1.22 APIDescribeVmInstanceRecoveryPoint

6.3 Automated O&M

6.3.1 Script Library

6.3.1.1 CreateGuestVmScript

API Request

URLs

```
POST zstack/v1/scripts
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "script1",
    "description": "this is a script",

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	5.2.0
description	String	The brief description of the error.	5.2.0
details	String	The details about the error.	5.2.0
elaboration	String	The reserved field. Default value: null.	5.2.0
opaque	LinkedHashMap	The reserved field. Default value: null.	5.2.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	5.2.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	5.2.0
name	String	The resource name.	5.2.0
description	String	The detailed description of the resource.	5.2.0
scriptContent	String	The script content.	5.2.0
renderParams	String	The custom parameters.	5.2.0
platform	String	The platform	5.2.0
scriptType	String	The script type.	5.2.0
scriptTimeout	Integer	The timeout period.	5.2.0
createDate	Timestamp	The creation time.	5.2.0

Name	Type	Description	Starting Version
lastOpDate	Timestamp	The last operation time	5.2.0

SDK Sample

Java SDK

```
CreateGuestVmScriptAction action = new CreateGuestVmScriptAction();
action.name = "script1";
action.description = "this is a script";
action.scriptContent = "ZWNobyBoZWxsb3dvcmxkCg==";
action.renderParams = "[{"key":"key","value":"value","description":"description"}]";
action.platform = "Linux";
action.scriptType = "Shell";
action.scriptTimeout = 30;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateGuestVmScriptAction.Result res = action.call();
```

Python SDK

```
CreateGuestVmScriptAction action = CreateGuestVmScriptAction()
action.name = "script1"
action.description = "this is a script"
action.scriptContent = "ZWNobyBoZWxsb3dvcmxkCg=="
action.renderParams = "[{"key":"key","value":"value","description":"description"}]"
action.platform = "Linux"
action.scriptType = "Shell"
action.scriptTimeout = 30
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CreateGuestVmScriptAction.Result res = action.call()
```

6.3.1.2 DeleteGuestVmScript

API Request

URLs

```
DELETE zstack/v1/scripts/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X DELETE http://localhost:8080/zstack/v1/scripts/  
ed1ef717239e37c29163dcad7576b8d4
```

Request Parameters

Name	Type	Location	Description	Valid Values	Starting Version
uuid	String	url	The resource UUID.		5.2.0
deleteMode	String	body	The deletion mode.	• Permissive • Enforcing, Permissive	5.2.0
systemTags	List	body	Optional. The system tags.		5.2.0
userTags	List	body	Optional. The user tags.		5.2.0

API返回

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{  
  "error": {  
    "code": "SYS.1001",  
    "description": "A message or a operation timeout",  
    "details": "Create VM on KVM timeout after 300s"  
  }  
}
```

SDK Sample

Java SDK

```
DeleteGuestVmScriptAction action = new DeleteGuestVmScriptAction();  
action.uuid = "ed1ef717239e37c29163dcad7576b8d4";  
action.deleteMode = "Permissive";  
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";  
DeleteGuestVmScriptAction.Result res = action.call();
```

Python SDK

```
DeleteGuestVmScriptAction action = DeleteGuestVmScriptAction()  
action.uuid = "ed1ef717239e37c29163dcad7576b8d4"  
action.deleteMode = "Permissive"  
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
DeleteGuestVmScriptAction.Result res = action.call()
```

6.3.1.3 UpdateGuestVmScript

API Request

URLs

```
PUT zstack/v1/scripts/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateGuestVmScript": {
    "name": "test-script",
    "description": "desc",
    "scriptContent": "ls -lh",
    "renderParams": "",
    "platform": "Linux",
    "scriptType": "Shell",
    "scriptTimeout": 60
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateGuestVmScript":{"name":"test-script","description":"desc","scriptContent":"ls -lh","renderParams":"","platform":"Linux","scriptType":"Shell","scriptTimeout":60}}' \
http://localhost:8080/zstack/v1/scripts/110b774720573fd6aec8ec70b669ffb8/actions
```

Request Parameters

Name	Type	Location	Description	Valid Values	Starting Version
uuid	String	url	The resource UUID.		5.2.0

Name	Type	Location	Description	Valid Values	Starting Version
name	String	body (contained in the updateGuestVmScript structure)	Optional. The resource name.		5.2.0
description	String	body (contained in the updateGuestVmScript structure)	Optional. The detailed description of the resource.		5.2.0
scriptContent	String	body (contained in the updateGuestVmScript structure)	Optional. The script content.		5.2.0
renderParams	String	body (contained in the updateGuestVmScript structure)	Optional. The custom parameters.		5.2.0
platform	String	body (contained in the updateGuestVmScript structure)	Optional. The platform.	- Windows - Linux	5.2.0
scriptType	String	body (contained in the updateGuestVmScript structure)	Optional. The script type.	- Shell - Python - Perl - Bat - Powershell	5.2.0

Name	Type	Location	Description	Valid Values	Starting Version
scriptTimeout	Integer	body (contained in the updateGuestVmScript structure)	Optional. The timeout period.		5.2.0
systemTags	List	body	Optional. The system tags.		5.2.0
userTags	List	body	Optional. The user tags.		5.2.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
UpdateGuestVmScriptAction action = new UpdateGuestVmScriptAction();
action.uuid = "110b774720573fd6aec8ec70b669ffb8";
action.name = "test-script";
action.description = "desc";
action.scriptContent = "ls -lh";
action.renderParams = "";
action.platform = "Linux";
action.scriptType = "Shell";
action.scriptTimeout = 60;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateGuestVmScriptAction.Result res = action.call();
```

Python SDK

```
UpdateGuestVmScriptAction action = UpdateGuestVmScriptAction()
action.uuid = "110b774720573fd6aec8ec70b669ffb8"
action.name = "test-script"
action.description = "desc"
action.scriptContent = "ls -lh"
action.renderParams = ""
```

```

action.platform = "Linux"
action.scriptType = "Shell"
action.scriptTimeout = 60
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateGuestVmScriptAction.Result res = action.call()

```

6.3.1.4 ExecuteGuestVmScript

API Request

URLs

```
PUT zstack/v1/scripts/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```

{
  "executeGuestVmScript": {
    "vmInstanceUuids": [
      "c9cc2aa748383595b144d9d12ff3abb2"
    ],
    "scriptTimeout": 60
  },
  "systemTags": [],
  "userTags": []
}

```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"executeGuestVmScript":{"vmInstanceUuids":
["c9cc2aa748383595b144d9d12ff3abb2"],"scriptTimeout":60}}' http://
localhost:8080/zstack/v1/scripts/f9f25df251013694bbbf68bb42b1bde1/
actions

```

Request Parameters

Name	Type	Location	Description	Valid Values	Starting Version
uuid	String	url	The resource UUID.		5.2.0

Name	Type	Location	Description	Valid Values	Starting Version
vmInstance Uuids	List	body (contained in the executeGuestVmScript structure)	The VM instance UUID .		5.2.0
scriptTimeout	Integer	body (contained in the executeGuestVmScript structure)	Optional. The timeout period .		5.2.0
logPath	String	body (contained in the executeGuestVmScript structure)	Optional. The log path.		5.2.0
systemTags	List	body (contained in the executeGuestVmScript structure)	Optional. The system tags.		5.2.0
userTags	List	body	Optional. The user tags.		5.2.0

API Response

Sample Response

```
{

}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"name":"hook","description":"xml hook","hookScript":"base64"}}' http://localhost:8080/zstack/v1/vm-instances/xml-hook-script
```

Request Parameters

Name	Type	Location	Description	Valid Values	Starting Version
name	String	body (contained in the params structure)	The XML Hook name.		5.2.0

Name	Type	Location	Description	Valid Values	Starting Version
description	String	body (contained in the params structure)	Optional. The detailed information of the XML Hook.		5.2.0
hookScript	String	body (contained in the params structure)	The XML Hook content.		5.2.0
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		5.2.0
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID list.		5.2.0
systemTags	List	body	Optional. The system tags.		5.2.0
userTags	List	body	Optional. The user tags.		5.2.0

API Response

Sample Response

```
{
  "inventory": {}
}
```

Name	Type	Description	Starting Version
success	boolean		5.2.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error	5.2.0
inventory	XmlHookInventory	See inventory	5.2.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	5.2.0
description	String	The brief description of the error.	5.2.0
details	String	The details about the error.	5.2.0
elaboration	String	The reserved field. Default value: null.	5.2.0
opaque	LinkedHashMap	The reserved field. Default value: null.	5.2.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	5.2.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The XML Hook UUID.	5.2.0
name	String	The XML Hook name.	5.2.0
description	String	The detailed information of the XML Hook.	5.2.0
hookScript	String	The XML Hook content.	5.2.0
libvirtVersion	String	The Libvirt version.	5.2.0
createDate	Timestamp	The creation time.	5.2.0
lastOpDate	Timestamp	The last operation time.	5.2.0

Name	Type	Description	Starting Version
type	XmlHookType	See type	5.2.0

#type

Name	Type	Description	Starting Version
System	XmlHookType		5.2.0
Customization	XmlHookType		5.2.0

SDK Sample

Java SDK

```
CreateVmUserDefinedXmlHookScriptAction action = new CreateVmUserDefinedXmlHookScriptAction();
action.name = "hook";
action.description = "xml hook";
action.hookScript = "base64";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateVmUserDefinedXmlHookScriptAction.Result res = action.call();
```

Python SDK

```
CreateVmUserDefinedXmlHookScriptAction action = CreateVmUserDefinedXmlHookScriptAction()
action.name = "hook"
action.description = "xml hook"
action.hookScript = "base64"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CreateVmUserDefinedXmlHookScriptAction.Result res = action.call()
```

6.3.2.2 ExpungeVmUserDefinedXmlHookScript**API Request**

URLs

```
DELETE zstack/v1/vm-instances/xml-hook-script
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X DELETE http://localhost:8080/zstack/v1/vm-instances/xml-hook-script
```

Request Parameters

Name	Type	Location	Description	Valid Values	Starting Version
uuid	String	body	The XML Hook UUID.		5.2.0
systemTags	List	body	Optional. The system tags.		5.2.0
userTags	List	body	Optional. The user tags.		5.2.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
ExpungeVmUserDefinedXmlHookScriptAction action = new ExpungeVmUserDefinedXmlHookScriptAction();
action.uuid = "99df64f50f5b34c6be5a7339d676aeb6";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
ExpungeVmUserDefinedXmlHookScriptAction.Result res = action.call();
```

Python SDK

```
ExpungeVmUserDefinedXmlHookScriptAction action = ExpungeVmUserDefinedXmlHookScriptAction()
action.uuid = "99df64f50f5b34c6be5a7339d676aeb6"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
ExpungeVmUserDefinedXmlHookScriptAction.Result res = action.call()
```

6.3.2.3 UpdateVmUserDefinedXmlHookScript

API Request

URLs

```
PUT zstack/v1/vm-instances/xml-hook-script
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateVmUserDefinedXmlHookScript": {
    "uuid": "a44a23f78c9c391c9d2f3a6a576e77d6",
    "name": "example"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateVmUserDefinedXmlHookScript":
{"uuid":"a44a23f78c9c391c9d2f3a6a576e77d6","name":"example"}}' http://
localhost:8080/zstack/v1/vm-instances/xml-hook-script
```

Request Parameters

Name	Type	Location	Description	Valid Values	Starting Version
uuid	String	body (contained in the updateVmUserDefinedXmlHookScript structure)	The XML Hook UUID.		5.2.0

Name	Type	Location	Description	Valid Values	Starting Version
name	String	body (contained in the updateVmUserDefinedXmlHookScript structure)	Optional. The XML Hook name.		5.2.0
description	String	body (contained in the updateVmUserDefinedXmlHookScript structure)	Optional. The detailed information of the XML Hook .		5.2.0
hookScript	String	body (contained in the updateVmUserDefinedXmlHookScript structure)	Optional. The XML Hook content.		5.2.0
systemTags	List	body	Optional. The system tags.		5.2.0
userTags	List	body	Optional. The user tags.		5.2.0
startupStrategy	String	body (contained in the updateVmUserDefinedXmlHookScript structure)	Optional. Whether reboot associated VM instances immediately.	• Reboot • None	5.2.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
```

```
"error": {
  "code": "SYS.1001",
  "description": "A message or a operation timeout",
  "details": "Create VM on KVM timeout after 300s"
}
```

SDK Sample

Java SDK

```
UpdateVmUserDefinedXmlHookScriptAction action = new UpdateVmUserDefinedXmlHookScriptAction();
action.uuid = "a44a23f78c9c391c9d2f3a6a576e77d6";
action.name = "example";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateVmUserDefinedXmlHookScriptAction.Result res = action.call();
```

Python SDK

```
UpdateVmUserDefinedXmlHookScriptAction action = UpdateVmUserDefinedXmlHookScriptAction()
action.uuid = "a44a23f78c9c391c9d2f3a6a576e77d6"
action.name = "example"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateVmUserDefinedXmlHookScriptAction.Result res = action.call()
```

6.3.2.4 AttachUserDefinedXmlHookScriptToVm

API Request

URLs

```
POST zstack/v1/xmlhook/{xmlHookUuid}/vm-instances/{vmInstanceUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "startupStrategy": "None"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"startupStrategy":"None"}}' http://
localhost:8080/zstack/v1/xmlhook/73300c2b203e3e43bc4b0dec7c3b0f21/vm-
instances/6baaffd8cb123dcc954b6242835267b9
```

Request Parameters

Name	Type	Location	Description	Valid Values	Starting Version
vmInstanceUuid	String	url	The VM instance UUID.		5.2.0
xmlHookUuid	String	url	The XML Hook UUID.		5.2.0
startupStrategy	String	body (contained in the params structure)	Optional. Whether reboot the VM instance immediately.	- Reboot - None	5.2.0
systemTags	List	body	Optional. The system tags.		5.2.0
userTags	List	body	Optional. The user tags.		5.2.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
AttachUserDefinedXmlHookScriptToVmAction action = new AttachUserDefinedXmlHookScriptToVmAction();
action.vmInstanceUuid = "6baaffd8cb123dcc954b6242835267b9";
```

```
action.xmlHookUuid = "73300c2b203e3e43bc4b0dec7c3b0f21";
action.startupStrategy = "None";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
AttachUserDefinedXmlHookScriptToVmAction.Result res = action.call();
```

Python SDK

```
AttachUserDefinedXmlHookScriptToVmAction action = AttachUserDefinedXml
HookScriptToVmAction()
action.vmInstanceUuid = "6baaffd8cb123dcc954b6242835267b9"
action.xmlHookUuid = "73300c2b203e3e43bc4b0dec7c3b0f21"
action.startupStrategy = "None"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
AttachUserDefinedXmlHookScriptToVmAction.Result res = action.call()
```

6.3.2.5 DetachUserDefinedXmlHookScriptFromVm

API Request

URLs

```
DELETE zstack/v1/xmlhook/vm-instances/{vmInstanceUuid}/detach
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/xmlhook/vm-
instances/588ac603fdd73c7c8519235a73271188/detach
```

Request Parameters

Name	Type	Location	Description	Valid Values	Starting Version
vmInstanceUuid	String	url	The VM instance UUID		5.2.0
startupStrategy	String	body	Optional. Whether reboot the VM instance immediately.	- Reboot - None	5.2.0
deleteMode	String	body	Optional. The deletion mode.	Permissive	5.2.0

Name	Type	Location	Description	Valid Values	Starting Version
				Enforcing, Permissive	
systemTags	List	body	Optional. The system tags.		5.2.0
userTags	List	body	Optional. The user tags.		5.2.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DetachUserDefinedXmlHookScriptFromVmAction action = new DetachUserDefinedXmlHookScriptFromVmAction();
action.vmInstanceId = "588ac603fdd73c7c8519235a73271188";
action.startupStrategy = "None";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DetachUserDefinedXmlHookScriptFromVmAction.Result res = action.call();
```

Python SDK

```
DetachUserDefinedXmlHookScriptFromVmAction action = DetachUserDefinedXmlHookScriptFromVmAction()
action.vmInstanceId = "588ac603fdd73c7c8519235a73271188"
action.startupStrategy = "None"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
DetachUserDefinedXmlHookScriptFromVmAction.Result res = action.call()
```

6.3.2.6 QueryVmUserDefinedXmlHookScript

API Request

URLs

```
GET zstack/v1/vm-instances/xml-hook-script
GET zstack/v1/vm-instances/xml-hook-script/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/vm-instances/xml-hook-script?
q=uuid=xxx&q=name=xxx
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/vm-instances/xml-hook-script/
c2643474f4ca3bb1a5c9e821f53c3ed2
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryVmUserDefinedXmlHookScript**, and pressing the Tab key.

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
QueryVmUserDefinedXmlHookScriptAction action = new QueryVmUserDefinedXmlHookScriptAction();
action.conditions = asList("uuid=xxx", "name=xxx");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
QueryVmUserDefinedXmlHookScriptAction.Result res = action.call();
```

Python SDK

```
QueryVmUserDefinedXmlHookScriptAction action = QueryVmUserDefinedXm
lHookScriptAction()
action.conditions = ["uuid=xxx", "name=xxx"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryVmUserDefinedXmlHookScriptAction.Result res = action.call()
```

6.4 Tag Operations

6.4.1 CreateSystemTag

API Request

URLs

```
POST zstack/v1/system-tags
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "resourceType": "HostV0",
    "resourceUuid": "c31d63c6d40d489e87fa7e1ee5707d47",
    "tag": "reservedMemory::1G"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"resourceType":"HostV0","resourceUuid":"47609e353c6f331f93ac114d06379f8d","tag":
\
http://localhost:8080/zstack/v1/system-tags
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
resourceType	String	body (contained in the params structure)	The resource type, which must be specified when you create a tag.		0.6
resourceUuid	String	body (contained in the params structure)	The resource UUID. If specified, the system will not allocate randomly a UUID to the resource.		0.6
tag	String	body (contained in the params structure)	The tag string.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

**Note:**

- When you create a system tag in ZStack Cloud, you can specify whether to automatically uninstall the physical PCI device allocated from the device specifications when the VM instance is shut down. You can also delete or change the configurations of existing VM instances. Note that you can add the **autoReleaseSpecRelatedPhysicalPciDevice** option to **SystemTags**.
 - Format of the **autoReleaseSpecRelatedPhysicalPciDevice** option: `autoReleaseSpecRelatedPhysicalPciDevice`
 - Example: `autoReleaseSpecRelatedPhysicalPciDevice`
- When you create a system tag in ZStack Cloud, you can specify whether to automatically uninstall the virtual PCI device allocated from the device specifications when the VM instance

is shut down. You can also delete or change the configurations of existing VM instances. Note that you can add the **autoReleaseSpecReleatedVirtualPciDevice** option to **SystemTags**.

- Format of the **autoReleaseSpecReleatedVirtualPciDevice** option: `autoReleaseSpecReleatedVirtualPciDevice`
- Example: `autoReleaseSpecReleatedVirtualPciDevice`
- You create system tags in ZStack Cloud to identify VM instances or VPC vRouters for which high availability policy is enabled or disabled. You can specify the **resourceBindings** option when you create **SystemTags**.
 - Format: `resourceBindings::Cluster:clusterUuid`
 - Example: `resourceBindings::Cluster:2sdasf231jvznsdak`
- You create system tags in ZStack Cloud to identify and filter the images of HA load balancers or VPC vRouters. You can specify the **applianceType** option when you create **SystemTags**.
 - Format: `applianceType::type`
 - Example: `applianceType::slb`
- You create system tags in ZStack Cloud to identify HA load balancers. You can specify the **SlbGroupUuid** option when you create **SystemTags**.
 - Format: `SlbGroupUuid::uuid`
 - Example: `SlbGroupUuid::12345678`
- When you add a system tag on ZStack Cloud, you can specify a custom parameter to the **boot.ipxe** file by adding **extraBootParams** to the **SystemTags** option.
 - Format: `extraBootParams::{custom parameter}`
 - Example: `extraBootParams::{acpi=noirq noapic}`

API Response

Sample Response

SDK Sample

Java SDK

```
QuerySystemTagAction action = new QuerySystemTagAction();
action.conditions = asList("inherent=true", "resourceType=HostV0");
action.sessionId = "05c74fc02e574e678a407f0cce5f8ae5f";
QuerySystemTagAction.Result res = action.call();
```

Python SDK

```
QuerySystemTagAction action = QuerySystemTagAction()
action.conditions = ["inherent=true", "resourceType=HostV0"]
action.sessionId = "a1d2f95577514d0a918ce1502dc27e33"
QuerySystemTagAction.Result res = action.call()
```

6.4.3 UpdateSystemTag

API Request

URLs

```
PUT zstack/v1/system-tags/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateSystemTag": {
    "tag": "for-large-DB"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateSystemTag":{"tag":"for-large-DB"}}' \
http://localhost:8080/zstack/v1/system-tags/2cb4ac52794535c3ae61f9612c1579e7/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
tag	String	body (contained in the updateSystemTag structure)	The tag string.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {
    "inherent": false,
    "uuid": "c17377dfd0794521a4fe02b6eb16cc5a",
    "resourceType": "HostV0",
    "tag": "reservedMemory::1G",
    "type": "System",
    "createDate": "May 11, 2017 1:22:30 PM",
    "lastOpDate": "May 11, 2017 1:22:30 PM"
  }
}
```

}

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventory	SystemTagInventory	See inventory .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventory

Name	Type	Description	Starting Version
inherent	Boolean	The inherent system tag.	0.6

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
resourceUuid	String	The resource UUID. If specified, the system will not allocate randomly a UUID to the resource.	0.6
resourceType	String	The resource type , which must be specified when you create a tag.	0.6
tag	String	The tag string.	0.6
type	String	The reserved field for internal use.	0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6

SDK Sample

Java SDK

```
UpdateSystemTagAction action = new UpdateSystemTagAction();
action.uuid = "1ba32bc1af0446b29bd969029a6052a5";
action.tag = "for-large-DB";
action.sessionId = "367f6162107a47d58c471c9164139fab";
UpdateSystemTagAction.Result res = action.call();
```

Python SDK

```
UpdateSystemTagAction action = UpdateSystemTagAction()
action.uuid = "be98b2f4e342485486cfa612eeabcaa5"
action.tag = "for-large-DB"
action.sessionId = "6b7af956a9a9477eba02753417380070"
```

```
UpdateSystemTagAction.Result res = action.call()
```

6.4.4 CreateUserTag

API Request

URLs

```
POST zstack/v1/user-tags
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "resourceType": "DiskOfferingV0",
    "resourceUuid": "beff527f6ccb45c8b215c59434b2fa5c",
    "tag": "for-large-DB"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"resourceType":"DiskOfferingV0","resourceUuid":"0a93a8d099a9339bb21b6e14a4ca3eea
large-DB"}}' \
http://localhost:8080/zstack/v1/user-tags
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
resourceType	String	body (contained in the params structure)	The resource type, which must be specified		0.6

Name	Type	Location	Description	Optional Value	Starting Version
			when you create a tag.		
resourceUuid	String	body (contained in the params structure)	The resource UUID. If specified, the system will not allocate randomly a UUID to the resource.		0.6
tag	String	body (contained in the params structure)	The tag string.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "b97c64cbf0524f809c05bf9eaf262b79",
    "resourceType": "DiskOfferingV0",
    "tag": "for-large-DB",
    "type": "User",
    "createDate": "May 11, 2017 1:22:33 PM",
    "lastOpDate": "May 11, 2017 1:22:33 PM"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventory	UserTagInventory	See inventory .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
resourceUuid	String	The resource UUID. If specified, the system will not allocate randomly a UUID to the resource.	0.6
resourceType	String	The resource type , which must be specified when you create a tag.	0.6
tag	String	The tag string.	0.6

Name	Type	Description	Starting Version
type	String	The reserved field for internal use.	0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6

SDK Sample

Java SDK

```
CreateUserTagAction action = new CreateUserTagAction();
action.resourceType = "DiskOfferingV0";
action.resourceUuid = "824246fa21d8405fbd48ea1cc7dbf049";
action.tag = "for-large-DB";
action.sessionId = "5d9cde1f7e6a43f586ec78dedf743201";
CreateUserTagAction.Result res = action.call();
```

Python SDK

```
CreateUserTagAction action = CreateUserTagAction()
action.resourceType = "DiskOfferingV0"
action.resourceUuid = "11f5e230f43d49e69815c35fbd39bad5"
action.tag = "for-large-DB"
action.sessionId = "6301b756253c4103adbf8c891d858e5f"
CreateUserTagAction.Result res = action.call()
```

6.4.5 QueryUserTag

API Request

URLs

```
GET zstack/v1/user-tags
GET zstack/v1/user-tags/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/user-tags?
q=resourceType=DiskOfferingV0&q=tag=for-large-DB
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X GET http://localhost:8080/zstack/v1/user-tags/
e2a3aa3463dd382fb9e434304167f331
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryUserTag**, and pressing the Tab key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "uuid": "ae4f2dd05a513e1e8d350d448c2071a9",
      "resourceType": "DiskOfferingV0",
      "tag": "for-large-DB",
      "type": "User",
      "createDate": "Nov 14, 2017 10:20:57 PM",
      "lastOpDate": "Nov 14, 2017 10:20:57 PM"
    }
  ]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventories	List	See inventories .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6

#inventories

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
resourceUuid	String	The UUID of the associated resource. If specified, the system will not allocate randomly a UUID to the resource.	0.6
resourceType	String	The resource type , which must be specified when you create a tag.	0.6
tag	String	The tag string.	0.6
type	String	The reserved field for internal use.	0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6

SDK Sample

Java SDK

```
QueryUserTagAction action = new QueryUserTagAction();
action.conditions = asList("resourceType=DiskOfferingV0", "tag=for-large-DB");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
QueryUserTagAction.Result res = action.call();
```

Python SDK

```
QueryUserTagAction action = QueryUserTagAction()
action.conditions = ["resourceType=DiskOfferingV0", "tag=for-large-DB"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryUserTagAction.Result res = action.call()
```

6.4.6 DeleteTag

API Request

URLs

```
DELETE zstack/v1/tags/{uuid}?deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 7a2a51da1758430382624e00144e70c5" \
-X DELETE http://localhost:8080/zstack/v1/
tags/1d33d909355247508cdbf9a0c0037dbe?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource name.		0.6
deleteMode	String	body	Optional. The delete mode . Options: Permissive Enforcing. Default mode: Permissive.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

**Note:**

- When you delete a tag in ZStack Cloud, you can specify whether to automatically uninstall the physical PCI device allocated from the device specifications when the VM instance is shut down. You can also delete or change the configurations of existing VM instances. Note that you can add the **autoReleaseSpecReleatedPhysicalPciDevice** option to **SystemTags**.
 - Format of the **autoReleaseSpecReleatedPhysicalPciDevice** option: `autoReleaseSpecReleatedPhysicalPciDevice`
 - Example: `autoReleaseSpecReleatedPhysicalPciDevice`
- When you delete a tag in ZStack Cloud, you can specify whether to automatically uninstall the virtual PCI device allocated from the device specifications when the VM instance is shut down. You can also delete or change the configurations of existing VM instances. Note that you can add the **autoReleaseSpecReleatedVirtualPciDevice** option to **SystemTags**.
 - Format of the **autoReleaseSpecReleatedVirtualPciDevice** option: `autoReleaseSpecReleatedVirtualPciDevice`
 - Example: `autoReleaseSpecReleatedVirtualPciDevice`

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteTagAction action = new DeleteTagAction();
action.uuid = "8262e178c23140f6a4de6f0d9e6a0913";
action.deleteMode = "Permissive";
action.sessionId = "94c2bff91f834a96b691a36e47888967";
DeleteTagAction.Result res = action.call();
```

Python SDK

```
DeleteTagAction action = DeleteTagAction()
action.uuid = "86a3f5e633dd40358cab072951058ec9"
```

```

action.deleteMode = "Permissive"
action.sessionId = "87c504af0b5a484d87a5ad4ddac57baa"
DeleteTagAction.Result res = action.call()

```

6.4.7 CreateTag

API Request

URLs

POST zstack/v1/tags

Headers

Authorization: OAuth the-session-uuid

Body

```

{
  "params": {
    "name": "new-tag",
    "value": "new-tag",
    "description": "tag-for-volume",
    "color": "#FFFFFF",
    "type": "simple"
  },
  "systemTags": [],
  "userTags": []
}

```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"name":"new-tag","value":"new-tag","description":"tag-for-volume","color":"#FFFFFF","type":"simple"}}' http://localhost:8080/zstack/v1/tags

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in	The resource name.		3.2.0

Name	Type	Location	Description	Optional Value	Starting Version
		the params structure)			
value	String	body (contained in the params structure)	The tag value.		3.2.0
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		3.2.0
color	String	body (contained in the params structure)	Optional. The tag color.		3.2.0
type	String	body (contained in the params structure)	Optional. The tag type.	• simple • withToken	3.2.0
resourceUuid	String	body (contained in the params structure)	Optional.		3.2.0
systemTags	List	body	Optional.		3.2.0
userTags	List	body	Optional.		3.2.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
CreateTagAction action = new CreateTagAction();
action.name = "new-tag";
action.value = "new-tag";
action.description = "tag-for-volume";
action.color = "#FFFFFF";
action.type = "simple";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateTagAction.Result res = action.call();
```

Python SDK

```
CreateTagAction action = new CreateTagAction();
action.name = "new-tag";
action.value = "new-tag";
action.description = "tag-for-volume";
action.color = "#FFFFFF";
action.type = "simple";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateTagAction.Result res = action.call();
```

6.4.8 QueryTag

API Request

URLs

```
GET zstack/v1/tags
```

```
GET zstack/v1/tags/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid

```
QueryTagAction action = QueryTagAction()
action.conditions = []
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryTagAction.Result res = action.call()
```

6.4.9 UpdateTag

API Request

URLs

```
PUT zstack/v1/tags/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateTag": {
    "value": "new-tag",
    "description": "tag-for-volume",
    "color": "#FFFFFF"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateTag":{"value":"new-tag","description":"tag-for-volume","color":"#FFFFFF"}}' http://localhost:8080/zstack/v1/tags/bc54e798f6ad4b9aa6a71365271d9464/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.2.0
name	String	body (contained in the updateTag structure)	Optional. The resource name.		3.2.0
value	String	body (contained in the updateTag structure)	Optional. The tag value.		3.2.0
description	String	body (contained in the updateTag structure)	Optional. The detailed description of the resource.		3.2.0
color	String	body (contained in the updateTag structure)	Optional. The tag color.		3.2.0
systemTags	List	body	Optional. The system tags.		3.2.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
UpdateTagAction action = new UpdateTagAction();
action.uuid = "a2bdf841dfdd48ecae5cabf44d0088e1";
action.value = "new-tag";
action.description = "tag-for-volume";
action.color = "#FFFFFF";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateTagAction.Result res = action.call();
```

Python SDK

```
UpdateTagAction action = UpdateTagAction()
action.uuid = "982dddc308b423baf8f82a74afc4e1c"
action.value = "new-tag"
action.description = "tag-for-volume"
action.color = "#FFFFFF"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateTagAction.Result res = action.call()
```

6.4.10 AttachTagToResources

API Request

URLs

```
POST zstack/v1/tags/{tagUuid}/resources
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "resourceUuids": [
      "bcd0e0f674aa47298dcbdc0efeffb55d"
    ]
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \

v1/tags/05811acb63e34f4c9c62b19a8eb4090b/resources
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
tagUuid	String	url	The tag UUID.		3.2.0
resourceUuids	List	body (contained in the params structure)	The resource UUID list.		3.2.0
tokens	Map	body (contained in the params structure)	Optional. The key and the value stored by the tag.		3.2.0
systemTags	List	body	Optional. The system tags.		3.2.0
userTags	List	body	Optional. The user tags.		3.2.0

API Response

**Note:**

After the API call succeeded, the success is returned as **true**. The number of successfully cloned VM instances can be returned by **numberOfClonedVm**. Actually, due to resource limitations, a portion of VM instances are cloned successfully, while another portion of VM instances fail to be cloned. The reason for each cloning failure is stored in the **error** field of **inventories**.

SDK Sample

Java SDK

```
AttachTagToResourcesAction action = new AttachTagToResourcesAction();
action.tagUuid = "6369948f4523457b87c311c550aa3e16";
action.resourceUuids = asList("ae2fdc6bbd254fcb9c36ac174c87a31");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
AttachTagToResourcesAction.Result res = action.call();
```

Python SDK

```
AttachTagToResourcesAction action = AttachTagToResourcesAction()
action.tagUuid = "1e9bee8a666340fe86599fa03962af90"
action.resourceUuids = [a4bb584d6c50401c98b7535dca839ba0]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
AttachTagToResourcesAction.Result res = action.call()
```

6.4.11 DetachTagFromResources

API Request

URLs

```
DELETE zstack/v1/tags/{tagUuid}/resources?
resourceUuids={resourceUuids}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/tags/
a8d23deaae2f4e7f96d11f066a180b92/resources?
resourceUuids=44f7b0ec930f458c9f4e7705ad7a0cb9
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
tagUuid	String	url	The tag UUID.		3.2.0
resourceUuids	List	url	The resource UUID list.		3.2.0
systemTags	List	body	Optional. The system tags.		3.2.0
userTags	List	body	Optional. The user tags.		3.2.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DetachTagFromResourcesAction action = new DetachTagFromResourcesAction
();
action.tagUuid = "09f0323668dc47fdac599724f1e6eb26";
action.resourceUuids = asList("170664525bde452db0923d200ac8e57b");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DetachTagFromResourcesAction.Result res = action.call();
```

Python SDK

```
DetachTagFromResourcesAction action = DetachTagFromResourcesAction()
action.tagUuid = "ff438628636242909e58eed72696aae8"
action.resourceUuids = [7719cc49d1574d479316d43f77183899]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DetachTagFromResourcesAction.Result res = action.call()
```

6.5 Migration Service (Plus)

The V2V Migration Service is a separate feature module. To use this feature, you need to purchase both the Base License and the Plus License of V2V Migration Service. The Plus License cannot be used independently.

6.5.1 Migration Service Operations

6.5.1.1 AddV2VConversionHost

API Request

URLs

```
POST zstack/v1/v2v-conversion-hosts
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "V2V-Converter-01",
    "description": "to convert vm from foreign hypervisor",
    "type": "VMWARE",
    "hostUuid": "fc2971a1a5943bdda6733feecfb26861",
    "storagePath": "/path/to/large/directory/"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"name":"V2V-Converter-01","description":"to
convert vm from foreign
hypervisor","type":"VMWARE","hostUuid":"fc2971a1a5943bdda6733feecfb26861","storage
path/to/large/directory/"}}' http://localhost:8080/zstack/v1/v2v-
conversion-hosts
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in	The resource name.		3.0.1

Name	Type	Location	Description	Optional Value	Starting Version
		the params structure)			
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		3.0.1
type	String	body (contained in the params structure)	The type of the V2V conversion host.	• VMWARE	3.0.1
hostUuid	String	body (contained in the params structure)	The host UUID.		3.0.1
storagePath	String	body (contained in the params structure)	The image storage path of the V2V migration.		3.0.1
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		3.0.1
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID list.		3.4.0
systemTags	List	body	Optional. The system tags.		3.0.1
userTags	List	body	Optional. The user tags.		3.0.1

**Note:**

- When you add a V2V conversion host in ZStack Cloud, you can specify the CIDR for the V2V migration network by adding the **networkcidr** option to **SystemTags**. The SystemTag is passed by using the **networkcidr** parameter.

- Format of the **networkcidr** option: `conversion::network::cidr::{netcidr}`
- Example: `conversion::network::cidr::{10.0.0.1/24}`.

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
url	String	body (contained in the params structure)	The source VM instance URL.		3.0.1
name	String	body (contained in the params structure)	The resource name.		3.0.1
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		3.0.1
conversionHostUuid	String	body (contained in the params structure)	Optional. The V2V conversion host UUID.		3.0.1
cpuNum	Integer	body (contained in	The CPU count.		3.0.1

Name	Type	Location	Description	Optional Value	Starting Version
		the params structure)			
memorySize	Long	body (contained in the params structure)	The memory size.		3.0.1
zoneUuid	String	body (contained in the params structure)	Optional. The zone UUID.		3.0.1
clusterUuid	String	body (contained in the params structure)	Optional. The cluster UUID.		3.0.1
hostUuid	String	body (contained in the params structure)	Optional. The host UUID.		3.0.1
primaryStorageUuid	String	body (contained in the params structure)	The primary storage UUID.		3.0.1
l3NetworkUuids	List	body (contained in the params structure)	The L3 network UUID list.		3.0.1
defaultL3NetworkUuid	String	body (contained in the params structure)	Optional. The UUID of the default L3 network.		3.0.1
platform	String	body (contained in the params structure)	Optional. The platform.	- Linux - Windows - WindowsVirtio - Paravirtualization	3.0.1

Name	Type	Location	Description	Optional Value	Starting Version
				Other	
type	String	body (contained in the params structure)	Optional. The VM instance type.	- UserVm - ApplianceVm	3.0.1
strategy	String	body (contained in the params structure)	Optional. The V2V migration strategy, which determines whether the target VM instance will be started immediately after migration.	- InstantStart - JustConvert	3.0.1
longJobName	String	body (contained in the params structure)	Optional. The migration job name.		3.0.1
longJobDescription	String	body (contained in the params structure)	Optional. The migration job description.		3.0.1
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID of the V2V migration job.		3.0.1
convertStrategy	String	body (contained in the params structure)	Optional.		3.6.0
sshPrivKey	String	body (contained in	Optional. The private key that is used		3.6.0

Name	Type	Location	Description	Optional Value	Starting Version
		the params structure)	to verify SSH login.		
pauseVm	boolean	body (contained in the params structure)	Optional. Whether to pause the VM instance before migration.		3.6.0
volumeFilters	List	body (contained in the params structure)	Optional. The volume filter information.		3.6.0
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID list.		3.6.0
systemTags	List	body	Optional. The system tags.		3.0.1
userTags	List	body	Optional. The user tags.		3.0.1

```

6.5.1.4 DeleteV2VConversionHost

API Request

URLs

```
DELETE zstack/v1/v2v-conversion-hosts/{uuid}?deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \  
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \  
-X DELETE http://localhost:8080/zstack/v1/v2v-conversion-  
hosts/5392899dcf7d351eab91ceeb6d38d4e5?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.0.1
deleteMode	String	url	Optional. The delete mode.		3.0.1
systemTags	List	body	Optional. The system tags.		3.0.1
userTags	List	body	Optional. The user tags.		3.0.1

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteV2VConversionHostAction action = new DeleteV2VConversionHostAction();
action.uuid = "5392899dcf7d351eab91ceeb6d38d4e5";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteV2VConversionHostAction.Result res = action.call();
```

Python SDK

```
DeleteV2VConversionHostAction action = DeleteV2VConversionHostAction()
action.uuid = "5392899dcf7d351eab91ceeb6d38d4e5"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteV2VConversionHostAction.Result res = action.call()
```

6.5.1.5 QueryV2VConversionHost

API Request

URLs

```
GET zstack/v1/v2v-conversion-hosts
GET zstack/v1/v2v-conversion-hosts/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/v2v-conversion-hosts?
q=uuid=4fb0bf1bce02350a9a19277897bc0595
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
```

```
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/v2v-conversion-hosts/
beb30505a0b434b68c1b68565290ebcf
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryV2VConversionHost**, and pressing the Tab key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "uuid": "91f0ea12823a39dea9db5d1cab133e3f",
      "name": "V2V-Converter-01",
      "description": "to convert vm from foreign hypervisor",
      "type": "VMWARE",
      "hostUuid": "f773c300a8343774bc45e0ea3980d6da",
      "storagePath": "/path/to/large/directory/",
      "state": "Enabled"
    }
  ]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.0.1
inventories	List	See inventories .	3.0.1

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.0.1
description	String	The brief description of the error.	3.0.1

Name	Type	Description	Starting Version
details	String	The details about the error.	3.0.1
elaboration	String	The reserved field. Default value: null.	3.0.1
opaque	LinkedHashMap	The reserved field. Default value: null.	3.0.1
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.0.1

#inventories

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.0.1
name	String	The resource name.	3.0.1
description	String	The detailed description of the resource.	3.0.1
type	String	The type.	3.0.1
hostUuid	String	The host UUID.	3.0.1
storagePath	String	The image storage path of the V2V migration.	3.0.1
state	String	The state.	3.0.1
createDate	Timestamp	The creation date.	3.0.1
lastOpDate	Timestamp	The last operation date.	3.0.1

SDK Sample

Java SDK

```
QueryV2VConversionHostAction action = new QueryV2VConversionHostAction();
action.conditions = asList("uuid=fbc030b04f5f3249bb1e6dad82489102");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
QueryV2VConversionHostAction.Result res = action.call();
```

Python SDK

```
QueryV2VConversionHostAction action = QueryV2VConversionHostAction()
action.conditions = ["uuid=7e845caa39013c19b3c4ea9630bdfef1"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryV2VConversionHostAction.Result res = action.call()
```

6.5.1.6 UpdateV2VConversionHost

API Request

URLs

```
PUT zstack/v1/v2v-conversion-hosts/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateV2VConversionHost": {
    "name": "new-name",
    "description": "new description",
    "storagePath": "/path/to/new/large/directory/"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateV2VConversionHost":{"name":"new-name","description":"new description","storagePath":"/path/to/new/large/directory/"},"systemTags":[],"userTags":[]}' http://localhost:8080/zstack/v1/v2v-conversion-hosts/077ec852bf603aa7b2ad7159e7707251/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.0.1
name	String	body (contained in the updateV2VConversionHost structure)	Optional. The resource name.		3.0.1
description	String	body (contained in the updateV2VConversionHost structure)	Optional. The detailed description of the resource.		3.0.1
storagePath	String	body (contained in the updateV2VConversionHost structure)	Optional. The image storage path of the V2V migration.		3.0.1
systemTags	List	body	Optional. The system tags.		3.0.1
userTags	List	body	Optional. The user tags.		3.0.1

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "fae22298c74b381b9dc0abcb02e7a3d7",
    "name": "new-name",

UpdateV2VConversionHostAction.Result res = action.call()
```

7 Operations Management

7.1 Tenant Management (Plus)

The Tenant Management feature is a separate feature module. To use this feature, you need to purchase both the Base License and the Plus License of Tenant Management. The Plus License cannot be used independently.

7.1.1 Organization Operations

7.1.1.1 CreateIAM2Organization

API Request

URLs

```
POST /v1/iam2/organizations
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "org1",
    "type": "Company",
    "parentUuid": "398f147aef0347099c16548bce0ceca1",
    "attributes": [
      {
        "name": "some-attribute-name",
        "value": "attribute-value"
      }
    ],
    "quota": {
      "vm.num": 100.0
    }
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"name":"org1","type":"Company","parentUuid":"1c26fe0d3e384ac9bf67ce4340d65413"},
[{"name":"some-attribute-name","value":"attribute-value"}]}' http://
localhost:8080/zstack/v1/iam2/organizations
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The resource name.		2.4.0
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		2.4.0
type	OrganizationType	body (contained in the params structure)	The organization type.	- Company - Department	2.4.0
parentUuid	String	body (contained in the params structure)	Optional.		2.4.0
attributes	List	body (contained in the params structure)	Optional.		2.4.0
quota	List	body (contained in the params structure)	Optional. The quota.		4.3.6
resourceUuid	String	body (contained in the params structure)	Optional.		2.4.0

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	body	Optional. The system tags.		2.4.0
userTags	List	body	Optional. The user tags.		2.4.0

API Response

Sample Response

```
{

```

7.1.1.5 ChangelAM2OrganizationParent

API Request

URLs

```
PUT zstack/v1/iam2/organizations/{parentUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeIAM2OrganizationParent": {
    "childrenUuids": [
      "b71dcc43656f399c82b09a379d1d6a74",
      "220c9c0ec8a53c37b9c680b0deed7563"
    ]
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"changeIAM2OrganizationParent":{"childrenUuids":
["b71dcc43656f399c82b09a379d1d6a74","220c9c0ec8a53c37b9c680b0deed7563"]}}'
http://localhost:8080/zstack/v1/iam2/
organizations/4fef501c5ba331f496907f642f609ea3/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
parentUuid	String	url			2.4.0
childrenUuids	List	body (contained in the changeIAM2 OrganizationParent structure)			2.4.0
systemTags	List	body	Optional. The system tags.		2.4.0
userTags	List	body	Optional. The user tags.		2.4.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
ChangeIAM2OrganizationParentAction action = new ChangeIAM2OrganizationParentAction();
action.parentUuid = "4fef501c5ba331f496907f642f609ea3";
action.childrenUuids = asList("b71dcc43656f399c82b09a379d1d6a74", "220c9c0ec8a53c37b9c680b0deed7563");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
ChangeIAM2OrganizationParentAction.Result res = action.call();
```

Python SDK

```
ChangeIAM2OrganizationParentAction action = ChangeIAM2OrganizationParentAction()
action.parentUuid = "4fef501c5ba331f496907f642f609ea3"
action.childrenUuids = [b71dcc43656f399c82b09a379d1d6a74, 220c9c0ec8a53c37b9c680b0deed7563]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
ChangeIAM2OrganizationParentAction.Result res = action.call()
```

7.1.1.6 ChangeIAM2OrganizationState

API Request

```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/iam2/virtual-ids/
b141cd136a1f384d9e8e68319f8e1281?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.4.0
deleteMode	String	url	Optional. The delete mode.		2.4.0
systemTags	List	body	Optional. The system tags.		2.4.0
userTags	List	body	Optional. The user tags.		2.4.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DeleteIAM2VirtualIDAction action = new DeleteIAM2VirtualIDAction();
action.uuid = "b141cd136a1f384d9e8e68319f8e1281";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteIAM2VirtualIDAction.Result res = action.call();
```

Python SDK

```
DeleteIAM2VirtualIDAction action = DeleteIAM2VirtualIDAction()
action.uuid = "b141cd136a1f384d9e8e68319f8e1281"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteIAM2VirtualIDAction.Result res = action.call()
```

7.1.1.11 QueryIAM2VirtualID

API Request

URLs

```
GET zstack/v1/iam2/virtual-ids
```

```
GET zstack/v1/iam2/virtual-ids/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/iam2/virtual-ids?q=name=test
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/iam2/virtual-ids/53c8b09e9ea63679add5c2003c4ce1cd
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryIAM2VirtualID**, and pressing the Tab key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "uuid": "e6e349e2d3e94ad39d2d620366de2b33",
      "name": "id1",
      "state": "Enabled",
      "attributes": [
        {
          "uuid": "fcd5e53a4bc44906a31e93012b46dab1",
          "name": "attribute-name",
          "value": "attribute-value",
          "type": "Customized"
        }
      ]
    }
  ]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.4.0
inventories	List	See inventories .	2.4.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	2.4.0
description	String	The brief description of the error.	2.4.0
details	String	The details about the error.	2.4.0
elaboration	String	The reserved field. Default value: null.	2.4.0

Name	Type	Description	Starting Version
opaque	LinkedHashMap	The reserved field. Default value: null.	2.4.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	2.4.0

#inventories

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	2.4.0
name	String	The resource name.	2.4.0
description	String	The detailed description of the resource.	2.4.0
createDate	Timestamp	The creation date.	2.4.0
lastOpDate	Timestamp	The last operation date.	2.4.0
state	State	See state .	2.4.0
attributes	List	See attributes .	2.4.0

#state

Name	Type	Description	Starting Version
name	String	The resource name.	2.4.0
ordinal	int		2.4.0

#attributes

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	2.4.0
name	String	The resource name.	2.4.0
value	String		2.4.0
type	AttributeType	See type .	2.4.0

#type

Name	Type	Description	Starting Version
name	String	The resource name.	2.4.0
ordinal	int		2.4.0

SDK Sample

Java SDK

```
QueryIAM2VirtualIDAction action = new QueryIAM2VirtualIDAction();
action.conditions = asList("name=test");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryIAM2VirtualIDAction.Result res = action.call();
```

Python SDK

```
QueryIAM2VirtualIDAction action = QueryIAM2VirtualIDAction()
action.conditions = ["name=test"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryIAM2VirtualIDAction.Result res = action.call()
```

7.1.1.12 LoginIAM2VirtualID**API Request**

URLs

```
PUT zstack/v1/iam2/virtual-ids/login
```

Body

```
{
  "loginIAM2VirtualID": {
    "name": "id1",
    "password": "password"
  },
  "systemTags": [],
  "userTags": []
}
```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
```

```
-X PUT -d '{"loginIAM2VirtualID":
{"name":"id1","password":"password"}}' http://localhost:8080/zstack/
v1/iam2/virtual-ids/login
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the loginIAM2VirtualID structure)	The resource name.		2.4.0
password	String	body (contained in the loginIAM2VirtualID structure)			2.4.0
systemTags	List	body	Optional. The system tags.		2.4.0
userTags	List	body	Optional. The user tags.		2.4.0
captchaUuid	String	body (contained in the loginIAM2VirtualID structure)	Optional.		2.4.0
verifyCode	String	body (contained in the loginIAM2VirtualID structure)	Optional.		2.4.0
clientInfo	Map	body (contained in the loginIAM2VirtualID structure)	Optional. The client information.		3.5.0

Name	Type	Location	Description	Optional Value	Starting Version
		irtualID structure)			

**Note:**

- When you log in to ZStack Cloud as a user, you can use the two-factor authentication method by adding the **twofatoken** option to **SystemTags**.
 - Format of the **twofatoken** option: twofatoken::6-digit two-factor authentication code
 - Example: twofatoken::123456

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "7fcdc9d9e4bf3d8681a4472f38951dc0",
    "noSessionEvaluation": false
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.4.0
inventory	SessionInventory	See inventory .	2.4.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	2.4.0

Name	Type	Description	Starting Version
description	String	The brief description of the error.	2.4.0
details	String	The details about the error.	2.4.0
elaboration	String	The reserved field. Default value: null.	2.4.0
opaque	LinkedHashMap	The reserved field. Default value: null.	2.4.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	2.4.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	2.4.0
accountUuid	String	The account UUID.	2.4.0
userUuid	String	The user UUID.	2.4.0
expiredDate	Timestamp		2.4.0
createDate	Timestamp	The creation date.	2.4.0

SDK Sample

Java SDK

```
LoginIAM2VirtualIDAction action = new LoginIAM2VirtualIDAction();  
action.name = "id1";  
action.password = "password";  
LoginIAM2VirtualIDAction.Result res = action.call();
```

Python SDK

```
LoginIAM2VirtualIDAction action = LoginIAM2VirtualIDAction()  
action.name = "id1"  
action.password = "password"
```

```
LoginIAM2VirtualIDAction.Result res = action.call()
```

7.1.1.13 ChangeIAM2VirtualIDState

API Request

URLs

```
PUT zstack/v1/iam2/virtual-ids/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeIAM2VirtualIDState": {
    "stateEvent": "enable"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"changeIAM2VirtualIDState":{"stateEvent":"enable"}}'
http://localhost:8080/zstack/v1/iam2/virtual-ids/
cc723702dcc24fafba542aa64d953d58/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.4.0
stateEvent	StateEvent	body (contained in the changeIAM2		- enable - disable	2.4.0

Name	Type	Location	Description	Optional Value	Starting Version
		VirtualIDState structure)			
systemTags	List	body	Optional. The system tags.		2.4.0
userTags	List	body	Optional. The user tags.		2.4.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "0524ea53082646569dfbc1bdecc82b70",

ChangeIAM2VirtualIDStateAction.Result res = action.call();
```

Python SDK

```
ChangeIAM2VirtualIDStateAction action = ChangeIAM2VirtualIDStateAction()
action.uuid = "7a40071d17b74e8085fb41c1e6f2216b"
action.stateEvent = "enable"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
ChangeIAM2VirtualIDStateAction.Result res = action.call()
```

7.1.1.14 AddIAM2VirtualIDsToOrganization

API Request

URLs

```
POST zstack/v1/iam2/organizations/{organizationUuid}/virtual-ids
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "virtualIDUuids": [
      "e747d2bd298c38aab5ac7ee561377845",
      "8bda3c55564031bc9666cd6607e1aa6f"
    ]
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"virtualIDUuids":
["e747d2bd298c38aab5ac7ee561377845","8bda3c55564031bc9666cd6607e1aa6f"]}}'
http://localhost:8080/zstack/v1/iam2/organizations/
e28067165c7a3d098ea64c564ac2f53f/virtual-ids
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
virtualIDUuids	List	body (contained in the params structure)			2.4.0

Name	Type	Location	Description	Optional Value	Starting Version
organizationUuid	String	url			2.4.0
systemTags	List	body	Optional. The system tags.		2.4.0
userTags	List	body	Optional. The user tags.		2.4.0

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
AddIAM2VirtualIDsToOrganizationAction action = new AddIAM2VirtualIDsToOrganizationAction();
action.virtualIDUuids = asList("e747d2bd298c38aab5ac7ee561377845", "8bda3c55564031bc9666cd6607e1aa6f");

action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
AddIAM2VirtualIDsToOrganizationAction.Result res = action.call()
```

7.1.1.15 AddAttributesToIAM2VirtualID

API Request

URLs

```
POST zstack/v1/iam2/virtual-ids/{uuid}/attributes
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "attributes": [
      {
        "name": "some-attribute-name",
        "value": "attribute-value"
      }
    ]
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.4.0
attributes	List	body (contained in the params structure)	The attributes.		2.4.0
systemTags	List	body	Optional. The system tags.		2.4.0

Name	Type	Location	Description	Optional Value	Starting Version
userTags	List	body	Optional. The user tags.		2.4.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",

SetOrganizationSupervisorAction.Result res = action.call()
```

7.1.1.18 BatchCreateIAM2VirtualIDFromConfigFile

API Request

URLs

```
POST zstack/v1/iam2/virtual-ids/from-file
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "virtualIDInfos": "FILE CONTENT ENCODE BY BASE64"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"virtualIDInfos":"FILE CONTENT ENCODE BY
BASE64"}}' http://localhost:8080/zstack/v1/iam2/virtual-ids/from-file
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
virtualIDInfos	String	body (contained in the params structure)	The user information encoded in Base64 format.		3.6.0
resourceUuid	String	body (contained in the params structure)	Optional.		3.6.0
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID list.		3.6.0
systemTags	List	body	Optional. The system tags.		3.6.0
userTags	List	body	Optional. The user tags.		3.6.0

API Response

Sample Response

```
{
  "numberOfImportedUser": 10.0
}
```

Name	Type	Description	Starting Version
numberOfImportedUser	int	The number of users that you have created successfully when you create users in bulk.	3.6.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.6.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.6.0
description	String	The brief description of the error.	3.6.0
details	String	The details about the error.	3.6.0
elaboration	String	The reserved field. Default value: null.	3.6.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.6.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.6.0

SDK Sample

Java SDK

```
BatchCreateIAM2VirtualIDFromConfigFileAction action = new BatchCreateIAM2VirtualIDFromConfigFileAction();
action.virtualIDInfos = "FILE CONTENT ENCODE BY BASE64";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
BatchCreateIAM2VirtualIDFromConfigFileAction.Result res = action.call();
```

Python SDK

```
BatchCreateIAM2VirtualIDFromConfigFileAction action = BatchCreateIAM2VirtualIDFromConfigFileAction()
action.virtualIDInfos = "FILE CONTENT ENCODE BY BASE64"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
BatchCreateIAM2VirtualIDFromConfigFileAction.Result res = action.call()
```

7.1.1.19 CheckIAM2VirtualIDConfigFile

API Request

URLs

```
PUT zstack/v1/iam2/virtual-ids/from-file
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "checkIAM2VirtualIDConfigFile": {
    "virtualIDInfos": "FILE CONTENT ENCODE BY BASE64"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"checkIAM2VirtualIDConfigFile":{"virtualIDInfos":"FILE
CONTENT ENCODE BY BASE64"}}' http://localhost:8080/zstack/v1/iam2/
virtual-ids/from-file
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
virtualIDInfos	String	body (contained in the checkIAM2V irtualIDCo nfigFile structure)	The user information encoded in Base64 format .		3.6.0

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	body	Optional. The system tags.		3.6.0
userTags	List	body	Optional. The user tags.		3.6.0

API Response

Sample Response

```
{
  "results": [
    {
      "line": 123.0,
      "detail": "Duplicate user name"
    }
  ]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.6.0
results	List	See results .	3.6.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.6.0
description	String	The brief description of the error.	3.6.0
details	String	The details about the error.	3.6.0

Name	Type	Description	Starting Version
elaboration	String	The reserved field. Default value: null.	3.6.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.6.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.6.0

#results

Name	Type	Description	Starting Version
line	int		3.6.0
detail	String		3.6.0

SDK Sample

Java SDK

```
CheckIAM2VirtualIDConfigFileAction action = new CheckIAM2VirtualIDCo
nfigFileAction();
action.virtualIDInfos = "FILE CONTENT ENCODE BY BASE64";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CheckIAM2VirtualIDConfigFileAction.Result res = action.call();
```

Python SDK

```
CheckIAM2VirtualIDConfigFileAction action = CheckIAM2VirtualIDCo
nfigFileAction()
action.virtualIDInfos = "FILE CONTENT ENCODE BY BASE64"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
CheckIAM2VirtualIDConfigFileAction.Result res = action.call()
```

7.1.1.20 AttachIAM2ProjectToIAM2Organization

API Request

URLs

```
POST zstack/v1/iam2/projects/{projectUuid}/iam2/organizations/
{organizationUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{}}' http://localhost:8080/zstack/
v1/iam2/projects/d5698b56f9f23a61958201cf7bee4e72/iam2/
organizations/72363068daea3772bb52aa663554c1e5
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
projectUuid	String	url	The project UUID.		3.6.0
organizationUuid	String	url	The organization UUID.		3.6.0
systemTags	List	body	Optional. The system tags.		3.6.0

Name	Type	Location	Description	Optional Value	Starting Version
userTags	List	body	Optional. The user tags.		3.6.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "262a60f99c5a49e8866ed9f92ef550e2",
    "name": "project",
    "state": "Enabled"
  }
}
```

Name	Type	Description	Starting Version
success	boolean		4.7.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.6.0
inventory	IAM2ProjectInventory	See inventory .	3.6.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.6.0
description	String	The brief description of the error.	3.6.0
details	String	The details about the error.	3.6.0
elaboration	String	The reserved field. Default value: null.	3.6.0

Name	Type	Description	Starting Version
opaque	LinkedHashMap	The reserved field. Default value: null.	3.6.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.6.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.6.0
name	String	The resource name.	3.6.0
description	String	The detailed description of the resource.	3.6.0
createDate	Timestamp	The creation date.	3.6.0
lastOpDate	Timestamp	The last operation date.	3.6.0
linkedAccountUuid	String		3.6.0
state	ProjectState	See state .	3.6.0
attributes	List	See attributes .	3.6.0

#state

Name	Type	Description	Starting Version
name	String	The resource name.	3.6.0
ordinal	int		3.6.0

#attributes

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.6.0
name	String	The resource name.	3.6.0
value	String		3.6.0

Name	Type	Description	Starting Version
type	AttributeType	See type .	3.6.0

#type

Name	Type	Description	Starting Version
name	String	The resource name.	3.6.0

```

7.1.1.24 GetIAM2OrganizationVirtualIDNumber

API Request

URLs

```
GET zstack/v1/iam2/organizations/{uuid}/virtualIDNumber
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/iam2/organizations/0572004dc33b36c4bd38216a024f5e0d/virtualIDNumber
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
uuid	String	url	The UUID of the organization.		4.0.0
systemTags	List	query	Optional. The system tags.		4.0.0
userTags	List	query	Optional. The user tags.		4.0.0

API Response

Sample Response

```
{
  "virtualTotalNumber": 0.0,
  "virtualDirectNumber": 0.0
}
```

}

Name	Type	Description	Starting Version
virtualTotalNumber	Integer		4.0.0
virtualDirectNumber	Integer		4.0.0
success	boolean		4.0.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.0.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	4.0.0
description	String	The brief description of the error.	4.0.0
details	String	The details about the error.	4.0.0
elaboration	String	The reserved field. Default value: null.	4.0.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.0.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.0.0

SDK Sample

Java SDK

```
GetIAM2OrganizationVirtualIDNumberAction action = new GetIAM2OrganizationVirtualIDNumberAction();
action.uuid = "0572004dc33b36c4bd38216a024f5e0d";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetIAM2OrganizationVirtualIDNumberAction.Result res = action.call();
```

Python SDK

```
GetIAM2OrganizationVirtualIDNumberAction action = GetIAM2OrganizationVirtualIDNumberAction()
action.uuid = "0572004dc33b36c4bd38216a024f5e0d"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetIAM2OrganizationVirtualIDNumberAction.Result res = action.call()
```

7.1.1.25 SetOrganizationOperation

API Request

URLs

```
GET zstack/v1/iam2/organizations/{uuid}/operation
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "setOrganizationOperation": {
    "virtualIDUuid": "7c5f7a277d094ce2bb17a3e7c776c636"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"setOrganizationOperation":
{"virtualIDUuid":"f8f5f4f72e5c47aab9a73aa5a1b6a1df"}}' http://
```

```
localhost:8080/zstack/v1/iam2/
organizations/8cf02a09ab864bcf883e19a1c06e6c7b/operation
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
uuid	String	url	The resource UUID.		4.3.6
virtualIDUuid	String	body(contained in the setOrganizationOperation structure)	The usee UUID.		4.3.6
systemTags	List	body	Optional. The system tags.		4.3.6
userTags	List	body	Optional. The user tags.		4.3.6

API Response

Sample Response

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
SetOrganizationOperationAction action = new SetOrganizationOperationAction();
action.uuid = "460a3e9f3d2047679e2bcd3cb0a8c3a";
action.virtualIDUuid = "12d54783a9ee42d198135ee1929d91ec";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
SetOrganizationOperationAction.Result res = action.call();
```

Python SDK

```
SetOrganizationOperationAction action = SetOrganizationOperationAction()
action.uuid = "673bd0eb6d0c4ef0b4c1dd2ef30ed82e"
action.virtualIDUuid = "543c2373e1da4c0cb76d232156db525f"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
SetOrganizationOperationAction.Result res = action.call()
```

7.1.1.26 UpdateOrganizationQuota

API Request

URLs

```
GET zstack/v1/iam2/Organization/quotas/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateOrganizationQuota": {
    "identityUuid": "3e083dfff99b309bb15e848f7acef41b",
    "name": "quota",
    "value": 100.0
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateOrganizationQuota":
{"identityUuid":"3e083dfff99b309bb15e848f7acef41b","name":"quota","value":100.0}}'
http://localhost:8080/zstack/v1/iam2/Organization/quotas/actions
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
identityUuid	String	body (contained in the updateOrga nizationQu ota structure)	The identity UUID.		4.3.6

Name	Type	Location	Description	Valid Value	Starting Version
name	String	body (contained in the updateOrganizationQuota structure)	The quota name.		4.3.6
value	long	body (contained in the updateOrganizationQuota structure)	The modified value.		4.3.6
systemTags	List	body	Optional. The system tags.		4.3.6
userTags	List	body	Optional. The user tags.		4.3.6

API Response

Sample Response

```
{
  "inventory": {
    "name": "quota",
    "identityUuid": "09081c19d997357ca8f07b4c44ddc640",
    "value": 20.0
  }
}
```

Name	Type	Description	Starting Version
success	boolean		4.3.6
inventory	QuotaInventory	See inventory .	4.3.6
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.3.6

#inventory

Name	Type	Description	Starting Version
name	String	The resource name.	4.3.6
identityUuid	String	The identity UUID.	4.3.6
identityType	String	The identity type.	4.3.6
value	Long	The default quota.	4.3.6
lastOpDate	Timestamp	The last update time.	4.3.6
createDate	Timestamp	The creation time.	4.3.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.3.6
description	String	The brief description of the error.	4.3.6
details	String	The details about the error.	4.3.6
elaboration	String	The reserved field. Default value: null.	4.3.6
opaque	LinkedHashMap	The reserved field. Default value: null.	4.3.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.3.6

SDK Sample

Java SDK

```
UpdateOrganizationQuotaAction action = new UpdateOrganizationQuotaAction();
action.identityUuid = "3e083dfff99b309bb15e848f7acef41b";
action.name = "quota";
```

```
action.value = 100.0;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateOrganizationQuotaAction.Result res = action.call();
```

Python SDK

```
UpdateOrganizationQuotaAction action = UpdateOrganizationQuotaAction()
action.identityUuid = "3e083dfff99b309bb15e848f7acef41b"
action.name = "quota"
action.value = 100.0
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateOrganizationQuotaAction.Result res = action.call()
```

7.1.1.27 GetOrganizationQuotaUsage

API Request

URLs

```
GET zstack/v1/iam2/organizations/quota/{uuid}/usages
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/iam2/organizations/
quota/9636f37046a63657b26cb28ed8cbc38a/usages
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
uuid	String	url	The resource UUID.		4.3.6
systemTags	List	query	Optional. The system tags.		4.3.6
userTags	List	query	Optional. The user tags.		4.3.6

API Response

Sample Response

```
{
  "usages": [
```

```
{
  "name": "testquota",
  "total": 20.0,
  "used": 10.0
}
```

Name	Type	Description	Starting Version
success	boolean		4.3.6
usages	List	See usages .	4.3.6
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.3.6

#usages

Name	Type	Description	Starting Version
name	String	The resource name.	4.3.6
total	Long	The total quota.	4.3.6
used	Long	The used quota.	4.3.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.3.6
description	String	The brief description of the error.	4.3.6
details	String	The details about the error.	4.3.6
elaboration	String	The reserved field. Default value: null.	4.3.6
opaque	LinkedHashMap	The reserved field. Default value: null.	4.3.6

Name	Type	Description	Starting Version
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.3.6

SDK Sample

Java SDK

```
GetOrganizationQuotaUsageAction action = new GetOrganizationQuotaUsageAction();
action.uuid = "9636f37046a63657b26cb28ed8cbc38a";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetOrganizationQuotaUsageAction.Result res = action.call();
```

Python SDK

```
GetOrganizationQuotaUsageAction action = GetOrganizationQuotaUsageAction()
action.uuid = "9636f37046a63657b26cb28ed8cbc38a"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetOrganizationQuotaUsageAction.Result res = action.call()
```

7.1.2 Project Operations

7.1.2.1 CreateIAM2Project

API Request

URLs

```
POST zstack/v1/iam2/projects
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "project",
    "attributes": [
      {
        "name": "some-attribute-name",
        "value": "attribute-value"
      }
    ]
  },
}
```

```

    "resourceTemplates": [
      "{\n  \"name\": \"sgName\", \n  \"resourceType\": \"SecurityGr
oupVO\"\n}"
    ],
    "organizationUuid": "50ce7e8c3b5f36c5b7ae528349364968"
  },
  "systemTags": [],
  "userTags": []
}

```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"name":"project","attributes":[{"name":"some-
attribute-name","value":"attribute-value"}],"resourceTemplates":
[{"\n  \"name\": \"sgName\", \n  \"resourceType\": \"SecurityGroupVO
\"\n"}],"organizationUuid":"50ce7e8c3b5f36c5b7ae528349364968"}'
http://localhost:8080/zstack/v1/iam2/projects

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The resource name.		2.4.0
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		2.4.0
attributes	List	body (contained in the params structure)	Optional.		2.4.0
resourceUuid	String	body (contained in the params structure)	Optional.		2.4.0
systemTags	List	body	Optional.		2.4.0

Name	Type	Location	Description	Optional Value	Starting Version
userTags	List	body	Optional.		2.4.0
quota	Map	body (contained in the params structure)	Optional.		2.4.0
roleUuids	List	body (contained in the params structure)	Optional.		2.4.0
resourceTemplates	List	body (contained in the params structure)	Optional. The resource template.		4.4.0
organizationUuid	String	body (contained in the params structure)	Optional. The organization UUID.		4.4.0
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID.		4.4.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "154643938783465e9899fd2617446a62",
    "name": "project",
    "state": "Enabled"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.4.0

Name	Type	Description	Starting Version
inventory	IAM2ProjectInventory	See inventory .	2.4.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	2.4.0
description	String	The brief description of the error.	2.4.0
details	String	The details about the error.	2.4.0
elaboration	String	The reserved field. Default value: null.	2.4.0
opaque	LinkedHashMap	The reserved field. Default value: null.	2.4.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	2.4.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	2.4.0
name	String	The resource name.	2.4.0
description	String	The detailed description of the resource.	2.4.0
createDate	Timestamp	The creation date.	2.4.0
lastOpDate	Timestamp	The last operation date.	2.4.0
linkedAccountUuid	String		2.4.0

Name	Type	Description	Starting Version
state	ProjectState	See state .	2.4.0

SDK Sample

Java SDK

```
CreateIAM2ProjectFromTemplateAction action = new CreateIAM2ProjectFromTemplateAction();
action.name = "project";
action.templateUuid = "adff5802786439228aaf60d8a53f7f93";
```

```
action.organizationUuid = "589ddc9593ea3d378fd34623ee243b55";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateIAM2ProjectFromTemplateAction.Result res = action.call();
```

Python SDK

```
CreateIAM2ProjectFromTemplateAction action = CreateIAM2ProjectFromTemplateAction()
action.name = "project"
action.templateUuid = "adff5802786439228aaf60d8a53f7f93"
action.organizationUuid = "589ddc9593ea3d378fd34623ee243b55"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CreateIAM2ProjectFromTemplateAction.Result res = action.call();
```

7.1.2.3 DeleteIAM2Project

API Request

URLs

```
DELETE zstack/v1/iam2/projects/{uuid}?deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/iam2/projects/
fff7e1b2a983029833d1ab52bfa8187?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.4.0
deleteMode	String	url	Optional. The delete mode.		2.4.0
systemTags	List	body	Optional. The system tags.		2.4.0
userTags	List	body	Optional. The user tags.		2.4.0

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteIAM2ProjectAction action = new DeleteIAM2ProjectAction();
action.uuid = "fffc7e1b2a983029833d1ab52bfa8187";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteIAM2ProjectAction.Result res = action.call();
```

Python SDK

```
DeleteIAM2ProjectAction action = DeleteIAM2ProjectAction()
action.uuid = "fffc7e1b2a983029833d1ab52bfa8187"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteIAM2ProjectAction.Result res = action.call()
```

7.1.2.4 QueryIAM2Project

API Request

URLs

```
GET zstack/v1/iam2/projects
```

```
GET zstack/v1/iam2/projects/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/iam2/projects?q=name=test
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \

Java SDK

```
QueryIAM2ProjectAction action = new QueryIAM2ProjectAction();
action.conditions = asList("name=test");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryIAM2ProjectAction.Result res = action.call();
```

Python SDK

```
QueryIAM2ProjectAction action = QueryIAM2ProjectAction()
action.conditions = ["name=test"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryIAM2ProjectAction.Result res = action.call()
```

7.1.2.5 UpdateIAM2Project**API Request**

URLs

```
PUT zstack/v1/iam2/projects/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateIAM2Project": {
    "name": "new-name"
  },
  "systemTags": [],
  "userTags": []
}
```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateIAM2Project":{"name":"new-name"}}' http://localhost:8080/zstack/v1/iam2/projects/63f57ce8c8013d56ac4df307cfb1c648/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.4.0
name	String	body (contained in the updateIAM2Project structure)	Optional. The resource name.		2.4.0
description	String	body (contained in the updateIAM2Project structure)	Optional. The detailed description of the resource.		2.4.0

SDK Sample

Java SDK

```
UpdateIAM2ProjectAction action = new UpdateIAM2ProjectAction();
action.uuid = "63f57ce8c8013d56ac4df307cfb1c648";
action.name = "new-name";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
UpdateIAM2ProjectAction.Result res = action.call();
```

Python SDK

```
UpdateIAM2ProjectAction action = UpdateIAM2ProjectAction()
action.uuid = "63f57ce8c8013d56ac4df307cfb1c648"
action.name = "new-name"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateIAM2ProjectAction.Result res = action.call()
```

7.1.2.6 LoginIAM2Project

API Request

URLs

```
PUT zstack/v1/iam2/projects/login
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "loginIAM2Project": {
    "projectName": "project"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"loginIAM2Project":{"projectName":"project"}}' http://
localhost:8080/zstack/v1/iam2/projects/login
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
projectName	String	body (contained			2.4.0

Name	Type	Location	Description	Optional Value	Starting Version
		in the loginIAM2P roject structure)			
clientInfo	Map	body (contained in the loginIAM2P roject structure)	Optional. The client information.		3.5.0
systemTags	List	body	Optional. The system tags.		2.4.0
userTags	List	body	Optional. The user tags.		2.4.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "3357cccd4d1436748a1721d5e12f2fcd",
    "noSessionEvaluation": false
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.4.0
inventory	SessionInventory	See inventory .	2.4.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code	2.4.0

Name	Type	Description	Starting Version
		that specifies an error . For example, SYS.1000, HOST.1001.	
description	String	The brief description of the error.	2.4.0
details	String	The details about the error.	2.4.0
elaboration	String	The reserved field. Default value: null.	2.4.0
opaque	LinkedHashMap	The reserved field. Default value: null.	2.4.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	2.4.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	2.4.0
accountUuid	String	The account UUID.	2.4.0
userId	String	The user UUID.	2.4.0
expiredDate	Timestamp		2.4.0
createDate	Timestamp	The creation date.	2.4.0

SDK Sample

Java SDK

```

LoginIAM2ProjectAction action = new LoginIAM2ProjectAction();
action.projectName = "project";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
LoginIAM2ProjectAction.Result res = action.call();

```

Python SDK

```

LoginIAM2ProjectAction action = LoginIAM2ProjectAction()
action.projectName = "project"

```

```
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
LoginIAM2ProjectAction.Result res = action.call()
```

7.1.2.7 SetIAM2ProjectLoginExpired

API Request

URLs

```
PUT zstack/v1/iam2/projects/add/login-expired/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "setIAM2ProjectLoginExpired": {
    "loginExpired": "allow 1/59 * * * * ? * to 30/59 * * * * ? *"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"setIAM2ProjectLoginExpired":{"loginExpired":"allow 1/59
* * * * ? * to 30/59 * * * * ? *"}}' http://localhost:8080/zstack/
v1/iam2/projects/add/login-expired/6b2eb879751736389b66649f98f3e29b/
actions
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
uuid	String	url	The resource UUID.		4.3.0
loginExpired	Map	body (contained in the setIAM2Pro	The login expiration expression.		4.3.0

Name	Type	Location	Description	Valid Value	Starting Version
		jectLoginExpired (structure)			
systemTags	List	body	Optional. The system tags.		4.3.0
userTags	List	body	Optional. The user tags.		4.3.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
SetIAM2ProjectLoginExpiredAction action = new SetIAM2ProjectLoginExpiredAction();
action.uuid = "6b2eb879751736389b66649f98f3e29b";
action.loginExpired = "allow 1/59 * * * * ? * to 30/59 * * * * ? *";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
SetIAM2ProjectLoginExpiredAction.Result res = action.call();
```

Python SDK

```
SetIAM2ProjectLoginExpiredAction action = SetIAM2ProjectLoginExpiredAction()
action.uuid = "6b2eb879751736389b66649f98f3e29b"
action.loginExpired = "allow 1/59 * * * * ? * to 30/59 * * * * ? *"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
SetIAM2ProjectLoginExpiredAction.Result res = action.call()
```

7.1.2.8 RemoveIAM2ProjectLoginExpired

API Request

URLs

```
PUT zstack/v1/iam2/projects/remove/login-expired/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "removeIAM2ProjectLoginExpired": {
    "attributeUuid": "f386055bea993b6c88d39d33fe133c44"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"removeIAM2ProjectLoginExpired":
{"attributeUuid":"f386055bea993b6c88d39d33fe133c44"}}' http://
localhost:8080/zstack/v1/iam2/projects/remove/login-expired/
b81a99d69d77366d8b1bba254aa02e0a/actions
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
uuid	String	url	The resource UUID.		4.3.0
attributeUuid	Map	body(contained in removeIAM2ProjectLog)			4.3.0

Name	Type	Location	Description	Valid Value	Starting Version
		inExpired structure)			
systemTags	List	body	Optional. The system tags.		4.3.0
userTags	List	body	Optional. The user tags.		4.3.0

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
RemoveIAM2ProjectLoginExpiredAction action = new RemoveIAM2ProjectLog
inExpiredAction();
action.uuid = "b81a99d69d77366d8b1bba254aa02e0a";
action.attributeUuid = "f386055bea993b6c88d39d33fe133c44";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
RemoveIAM2ProjectLoginExpiredAction.Result res = action.call();
```

Python SDK

```
RemoveIAM2ProjectLoginExpiredAction action = RemoveIAM2ProjectLog
inExpiredAction()
action.uuid = "b81a99d69d77366d8b1bba254aa02e0a"
action.attributeUuid = "f386055bea993b6c88d39d33fe133c44"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
RemoveIAM2ProjectLoginExpiredAction.Result res = action.call()
```

7.1.2.9 ChangelAM2ProjectState

API Request

URLs

```
PUT zstack/v1/iam2/projects/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeIAM2ProjectState": {
    "stateEvent": "enable"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"changeIAM2ProjectState":{"stateEvent":"enable"}}' http://
localhost:8080/zstack/v1/iam2/
projects/13096969d0093f76802126ca15d9ac9c/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.4.0
stateEvent	StateEvent	body (contained in the changeIAM2		- enable - disable	2.4.0

Name	Type	Location	Description	Optional Value	Starting Version
		ProjectState structure)			
systemTags	List	body	Optional. The system tags.		2.4.0
userTags	List	body	Optional. The user tags.		2.4.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "21fc3599223d46ddb5d065f6bf674a70",
    "name": "project",
    "state": "Enabled"
  }
}
```

-X DELETE http://localhost:8080/zstack/v1/iam2/
projects/3212113e647a3c4d9e7d2dc87f607a45/attributes?
attributeUuids=46f60ffedda13fbda87a584d5b23b6ba&attributeUuids=c41ee23e5fd330ccbb
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.4.0
attributeUuids	List	url			2.4.0
systemTags	List	body	Optional. The system tags.		2.4.0
userTags	List	body	Optional. The user tags.		2.4.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
RemoveAttributesFromIAM2ProjectAction action = new RemoveAttr
ibutesFromIAM2ProjectAction();
action.uuid = "3212113e647a3c4d9e7d2dc87f607a45";
action.attributeUids = asList("46f60ffedda13fbda87a584d5b23b6ba", "
c41ee23e5fd330ccbb9f9cf8bb2061c1");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
RemoveAttributesFromIAM2ProjectAction.Result res = action.call();
```

Python SDK

```
RemoveAttributesFromIAM2ProjectAction action = RemoveAttributesFrom
IAM2ProjectAction()
action.uuid = "3212113e647a3c4d9e7d2dc87f607a45"
action.attributeUids = [46f60ffedda13fbda87a584d5b23b6ba, c41ee23e5f
d330ccbb9f9cf8bb2061c1]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
RemoveAttributesFromIAM2ProjectAction.Result res = action.call()
```

7.1.2.14 CreateIAM2VirtualIDGroup

API Request

URLs

```
POST zstack/v1/iam2/projects/{projectUuid}/groups?
projectUuid={projectUuid}
```

```
POST zstack/v1/iam2/groups?projectUuid={projectUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
```

```

"params": {
  "projectUuid": "ae81ff6fb37e392ca9b7568475f064b6",
  "name": "group"
},
"systemTags": [],
"userTags": []
}

```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":

SDK Sample

Java SDK

```
CreateIAM2VirtualIDGroupAction action = new CreateIAM2VirtualIDGroupAction();
action.projectUuid = "ae81ff6fb37e392ca9b7568475f064b6";
action.name = "group";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateIAM2VirtualIDGroupAction.Result res = action.call();
```

Python SDK

```
CreateIAM2VirtualIDGroupAction action = CreateIAM2VirtualIDGroupAction()
action.projectUuid = "ae81ff6fb37e392ca9b7568475f064b6"
action.name = "group"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
CreateIAM2VirtualIDGroupAction.Result res = action.call()
```

7.1.2.15 DeleteIAM2VirtualIDGroup

API Request

URLs

```
DELETE zstack/v1/iam2/projects/groups/{uuid}?deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/iam2/projects/
groups/70844c49506031a69cb4a19a1478cddf?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.4.0
deleteMode	String	url	Optional. The delete mode.		2.4.0
systemTags	List	body	Optional. The system tags.		2.4.0
userTags	List	body	Optional. The user tags.		2.4.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DeleteIAM2VirtualIDGroupAction action = new DeleteIAM2VirtualIDGroupAction();
action.uuid = "70844c49506031a69cb4a19a1478cddf";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteIAM2VirtualIDGroupAction.Result res = action.call();
```

Python SDK

```
DeleteIAM2VirtualIDGroupAction action = DeleteIAM2VirtualIDGroupAction()
action.uuid = "70844c49506031a69cb4a19a1478cddf"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteIAM2VirtualIDGroupAction.Result res = action.call()
```

7.1.2.16 QueryIAM2VirtualIDGroup

API Request

URLs

```
GET zstack/v1/iam2/projects/groups
```

```
GET zstack/v1/iam2/projects/groups/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/iam2/projects/groups?q=name=test
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \

projectUuid	String	url			2.4.0
virtualIDUuids	List	body (contained in the params structure)			2.4.0
systemTags	List	body	Optional. The system tags.		2.4.0
userTags	List	body	Optional. The user tags.		2.4.0
roleUuids	List	body (contained in the params structure)	Optional.		2.4.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```

SDK Sample

Java SDK

```
UpdateIAM2VirtualIDAction action = new UpdateIAM2VirtualIDAction();
action.uuid = "348ac2cc1d9438ffa84878d4cb494234";
action.name = "new-name";
action.description = "new-desc";
action.password = "new-password";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateIAM2VirtualIDAction.Result res = action.call();
```

Python SDK

```
UpdateIAM2VirtualIDAction action = UpdateIAM2VirtualIDAction()
action.uuid = "348ac2cc1d9438ffa84878d4cb494234"
action.name = "new-name"
action.description = "new-desc"
action.password = "new-password"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateIAM2VirtualIDAction.Result res = action.call()
```

7.1.2.28 AddRolesToIAM2VirtualID**API Request**

URLs

```
POST zstack/v1/iam2/projects/virtual-ids/{virtualIDUuid}/roles
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
```

```

"params": {
  "roleUuids": [
    "d1140b7d8ca03f7ba15ce467a9befec6",
    "8245aba180633254a5dfd76cbdd6f773"
  ],
  "systemTags": [],
  "userTags": []
}

```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"roleUuids":
["d1140b7d8ca03f7ba15ce467a9befec6","8245aba180633254a5dfd76cbdd6f773"]}}'
http://localhost:8080/zstack/v1/iam2/projects/virtual-
ids/3390a29bd4df30a8a2b69cf2b56be703/roles

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
virtualIDUuid	String	url			2.4.0
roleUuids	List	body (contained in the params structure)			2.4.0
systemTags	List	body	Optional. The system tags.		2.4.0
userTags	List	body	Optional. The user tags.		2.4.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```

{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}

```

```
}
```

SDK Sample

Java SDK

```
AddRolesToIAM2VirtualIDAction action = new AddRolesToIAM2VirtualIDAction();
action.virtualIDUuid = "3390a29bd4df30a8a2b69cf2b56be703";
action.roleUuids = asList("d1140b7d8ca03f7ba15ce467a9befec6", "8245aba180633254a5dfd76cbdd6f773");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
AddRolesToIAM2VirtualIDAction.Result res = action.call();
```

Python SDK

```
AddRolesToIAM2VirtualIDAction action = AddRolesToIAM2VirtualIDAction()
action.virtualIDUuid = "3390a29bd4df30a8a2b69cf2b56be703"
action.roleUuids = [d1140b7d8ca03f7ba15ce467a9befec6, 8245aba180633254a5dfd76cbdd6f773]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
AddRolesToIAM2VirtualIDAction.Result res = action.call()
```

7.1.2.29 RemoveRolesFromIAM2VirtualID

API Request

URLs

```
DELETE zstack/v1/iam2/projects/virtual-ids/{virtualIDUuid}/roles?

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/identities/
roles/6576d603b86634d68d49e9df50443e7f?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
deleteMode	String	url	Optional. The delete mode.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteRoleAction action = new DeleteRoleAction();
action.uuid = "6576d603b86634d68d49e9df50443e7f";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteRoleAction.Result res = action.call();
```

Python SDK

```
DeleteRoleAction action = DeleteRoleAction()
action.uuid = "6576d603b86634d68d49e9df50443e7f"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteRoleAction.Result res = action.call()
```

7.1.2.36 QueryRole

API Request

URLs

```
GET zstack/v1/identities/roles
GET zstack/v1/identities/roles/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/identities/roles?q=name=role-1
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X GET http://localhost:8080/zstack/v1/identities/roles/159398ac7d57325daeb62f4abbc5107b
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryRole**, and pressing the Tab key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "uuid": "bc0df9075c8f30cc9150ea9d2030b470",
      "name": "role-1",
      "description": "role for test",
      "type": "Customized",
      "state": "Enabled",
      "statements": [
        "statement for test"
      ]
    }
  ]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventories	List	See inventories .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6

Name	Type	Description	Starting Version
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventories

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
name	String	The resource name.	0.6
description	String	The detailed description of the resource.	0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6
type	RoleType	See type .	0.6
state	RoleState	See state .	0.6
statements	List	See statements .	0.6

#type

Name	Type	Description	Starting Version
name	String	The resource name.	0.6

ordinal	int		0.6

SDK Sample

Java SDK

```
QueryRoleAction action = new QueryRoleAction();
action.conditions = asList("name=role-1");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryRoleAction.Result res = action.call();
```

Python SDK

```
QueryRoleAction action = QueryRoleAction()
```

```

action.conditions = ["name=role-1"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryRoleAction.Result res = action.call()

```

7.1.2.37 UpdateRole

API Request

URLs

```
PUT zstack/v1/identities/roles/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```

{
  "updateRole": {
    "name": "role-1",
    "description": "role for test",
    "statements": [
      {}
    ],
    "policyUuids": [
      "da93f6bf55823973a1bea123d7f5427f"
    ]
  },
  "systemTags": [],
  "userTags": []
}

```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateRole":{"name":"role-1","description":"role
for test","statements":[{}],"policyUuids":
["da93f6bf55823973a1bea123d7f5427f"]}}' http://localhost:8080/zstack/
v1/identities/roles/a3489a74f7e23a5682b808b59f4d25c4/actions

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
name	String	body (contained in the updateRole structure)	The resource name.		0.6
description	String	body (contained in the updateRole structure)	Optional. The detailed description of the resource.		0.6
statements	List	body (contained in the updateRole structure)	Optional. The permission statements.		0.6
policyUuids	List	body (contained in the updateRole structure)	Optional. The permission policy UUIDs.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "14c577188a0c3ee8871e27087a287bc2",
    "name": "role-1",
    "description": "role for test",
    "type": "Customized",
    "state": "Enabled",
    "statements": [
      "statement for test"
    ]
  }
}
```

}

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6

UpdateRoleAction.Result res = action.call()
```

7.1.2.38 ChangeRoleState

API Request

URLs

```
PUT zstack/v1/identities/roles/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeRoleState": {
    "stateEvent": "enable"
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"changeRoleState":{"stateEvent":"enable"}}'
http://localhost:8080/zstack/v1/identities/roles/
bd69220686b1390e9ae7c473c73745fa/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
stateEvent	RoleStateEvent	body (contained in the changeRoleState structure)		- enable - disable	0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

action.policyStatementUuids = asList("d0e7ec31946437d3b17ec2e20e48a1ac");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
RemovePolicyStatementsFromRoleAction.Result res = action.call();
```

Python SDK

```
RemovePolicyStatementsFromRoleAction action = RemovePolicyStatementsFromRoleAction()
action.uuid = "fd6ff08afb3e3a4db5f13816b0110caa"
action.policyStatementUuids = [d0e7ec31946437d3b17ec2e20e48a1ac]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
RemovePolicyStatementsFromRoleAction.Result res = action.call()
```

7.1.2.43 AttachRoleToAccount

API Request

URLs

```
POST zstack/v1/identities/accounts/{accountUuid}/roles/{roleUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{}}' http://localhost:8080/zstack/v1/
identities/accounts/053a25bbfe2c34a889d75601e64d4a51/roles/
b7a901c45db33f12993c9c7aad874ff4
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
roleUuid	String	url			0.6
accountUuid	String	url	The account UUID.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
AttachRoleToAccountAction action = new AttachRoleToAccountAction();
action.roleUuid = "b7a901c45db33f12993c9c7aad874ff4";
action.accountUuid = "053a25bbfe2c34a889d75601e64d4a51";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
AttachRoleToAccountAction.Result res = action.call();
```

Python SDK

```
AttachRoleToAccountAction action = AttachRoleToAccountAction()
action.roleUuid = "b7a901c45db33f12993c9c7aad874ff4"
action.accountUuid = "053a25bbfe2c34a889d75601e64d4a51"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
AttachRoleToAccountAction.Result res = action.call()
```

7.1.2.44 DetachRoleFromAccount

API Request

URLs

```
DELETE zstack/v1/identities/accounts/{accountUuid}/roles/{roleUuid}?
deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/identities/
accounts/ac3ea9154a603cbcabbb1664dbcf66ef/roles/
ca3f332b7ffd347fa30ba01be1176b96?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
roleUuid	String	url			0.6
accountUuid	String	url	The account UUID.		0.6
deleteMode	String	url	Optional. The delete mode.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DetachRoleFromAccountAction action = new DetachRoleFromAccountAction
();
action.roleUuid = "ca3f332b7ffd347fa30ba01be1176b96";
action.accountUuid = "ac3ea9154a603cbcabbb1664dbcf66ef";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DetachRoleFromAccountAction.Result res = action.call();
```

Python SDK

```
DetachRoleFromAccountAction action = DetachRoleFromAccountAction()
action.roleUuid = "ca3f332b7ffd347fa30ba01be1176b96"
action.accountUuid = "ac3ea9154a603cbcabbb1664dbcf66ef"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
DetachRoleFromAccountAction.Result res = action.call()
```

7.1.2.45 GetIAM2VirtualIDAPIPermission

API Request

URLs

```
GET zstack/v1/iam2/virtual-ids/api-permissions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/iam2/virtual-ids/api-
permissions?
apisToCheck={"apiName":"org.zstack.header.vm.APICreateVmInstanceMsg", "body":
{"name":"vm"}}
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
apisToCheck	List	query	Optional.		2.4.0
systemTags	List	query	Optional.		2.4.0
userTags	List	query	Optional.		2.4.0

API Response

Sample Response

```
{
  "permissions": {
    "org.zstack.header.vm.APICreateVmInstanceMsg": {
      "allow": true
    }
  },
  "noPermission": false
}
```

Name	Type	Description	Starting Version
noPermission	boolean		2.4.0
success	boolean		2.4.0

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.4.0
permissions	Map	See permissions .	2.4.0
error	ErrorCode	See error .	2.4.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#permissions

Name	Type	Description	Starting Version
allow	boolean	Whether you have the permission.	2.4.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

SDK Sample

Java SDK

```
GetIAM2VirtualIDAPIPermissionAction action = new GetIAM2VirtualIDAPIPermissionAction();
action.apisToCheck = asList("{\"apiName\":\"org.zstack.header.vm.APICreateVmInstanceMsg\", \"body\":{\"name\":\"vm\"}}");
action.onlyCheckParams = false;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetIAM2VirtualIDAPIPermissionAction.Result res = action.call();
```

Python SDK

```
GetIAM2VirtualIDAPIPermissionAction action = GetIAM2VirtualIDAPIPermissionAction()
action.apisToCheck = [{"apiName":"org.zstack.header.vm.APICreateVmInstanceMsg", "body":{"name":"vm"}}]
action.onlyCheckParams = false
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
GetIAM2VirtualIDAPIPermissionAction.Result res = action.call()
```

7.1.2.46 LoginIAM2Platform

API Request

URLs

```
PUT zstack/v1/iam2/platform/login
```

Body

```
{
  "loginIAM2Platform": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"loginIAM2Platform":{}}' http://localhost:8080/zstack/v1/
iam2/platform/login
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
clientInfo	Map	body(contained in the loginIAM2Platform structure)	Optional.		4.0.0
systemTags	List	body	Optional. The system tags.		4.0.0
userTags	List	body	Optional. The user tags.		4.0.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "243138fdb96e37d785ff4bfe01484b75",
    "noSessionEvaluation": false
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.0.0
inventory	SessionInventory	See inventory .	4.0.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.0.0
description	String	The brief description of the error.	4.0.0
details	String	The details about the error.	4.0.0
elaboration	String	The reserved field. Default value: null.	4.0.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.0.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.0.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The session UUID.	4.0.0
accountUuid	String	The account UUID	4.0.0
userUuid	String	The user UUID.	4.0.0
expiredDate	Timestamp		4.0.0
createDate	Timestamp	The time when the session was started.	4.0.0

SDK Sample

Java SDK

```
LoginIAM2PlatformAction action = new LoginIAM2PlatformAction();
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
LoginIAM2PlatformAction.Result res = action.call();
```

Python SDK

```
LoginIAM2PlatformAction action = LoginIAM2PlatformAction()
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
LoginIAM2PlatformAction.Result res = action.call()
```

7.1.3 Ticket Operations

7.1.3.1 CreateTicket

API Request

URLs

```

```

7.1.3.3 ChangeTicketStatus

API Request

URLs

```
PUT zstack/v1/tickets/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeTicketStatus": {
    "statusEvent": "approve",
    "comment": "this is the comment for change status operation"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"changeTicketStatus":
{"statusEvent":"approve","comment":"this is the comment for change
status operation"}}' http://localhost:8080/zstack/v1/tickets/
e9377476db3f375bbff78dc3b9204f00/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.0.0
statusEvent	TicketStatusEvent	body (contained in the changeTicketStatus structure)		• open • approve • cancel • reject • reopen	3.0.0
comment	String	body (contained in the changeTicketStatus structure)	Optional.		3.0.0
systemTags	List	body	Optional.		3.0.0
userTags	List	body	Optional.		3.0.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "f4483251fd48cdae0dbb966a2652c9",
    "name": "ticket",
    "description": "ticket description",

apiBody	Object		3.0.0

SDK Sample

Java SDK

```
QueryTicketAction action = new QueryTicketAction();
action.conditions = asList("uuid=e397806ebbe0376b96d7c857e06b9714");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryTicketAction.Result res = action.call();
```

Python SDK

```
QueryTicketAction action = QueryTicketAction()
action.conditions = ["uuid=0198e730d1dc334da8aab9b3a219ba35"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryTicketAction.Result res = action.call()
```

7.1.3.5 QueryArchiveTicket**API Request**

URLs

```
GET zstack/v1/tickets/archives
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X GET http://localhost:8080/zstack/v1/tickets/archives
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryArchiveTicket**, and pressing the Tab key.

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
QueryArchiveTicketAction action = new QueryArchiveTicketAction();
action.conditions = asList();
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryArchiveTicketAction.Result res = action.call();
```

Python SDK

```
QueryArchiveTicketAction action = QueryArchiveTicketAction()
action.conditions = []
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
QueryArchiveTicketAction.Result res = action.call()
```

7.1.3.6 QueryTicketHistory

API Request

URLs

```
GET zstack/v1/tickets/histories
```

```
GET zstack/v1/tickets/histories/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/tickets/histories?
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/tickets/
histories/2cbcaa4913f73d968a9b075a1607bbee
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryTicketHistory**, and pressing the Tab key.

API Response

Sample Response

```
{
  "inventories": [

createDate	Timestamp	The creation date.	3.0.0
lastOpDate	Timestamp	The creation date.	3.0.0
collectionUuid	String		3.0.0

SDK Sample

Java SDK

```
CreateIAM2TickFlowCollectionAction action = new CreateIAM2TickFlowCollectionAction();
action.flows = asList([name:flow1, approverUuid:1c4db59a73b63f968889764bcb2bae9d],[name:flow2, approverUuid:eb9dc5050030323281c255864ca6c633]);
```

```

action.projectUuid = "bdd993eb57c13134967b15ed38ba33c4";
action.name = "flow collection";
action.description = "flow collection description";
action.isDefault = false;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateIAM2TickFlowCollectionAction.Result res = action.call();

```

Python SDK

```

CreateIAM2TickFlowCollectionAction action = CreateIAM2TickFlowCo
llectionAction()
action.flows = [[name:flow1, approverUuid:1c4db59a73b63f968889
764bcb2bae9d], [name:flow2, approverUuid:eb9dc5050030323281c2
55864ca6c633]]
action.projectUuid = "bdd993eb57c13134967b15ed38ba33c4"
action.name = "flow collection"
action.description = "flow collection description"
action.isDefault = false
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CreateIAM2TickFlowCollectionAction.Result res = action.call()

```

7.1.3.8 DeleteTicketFlowCollection

API Request

URLs

```

DELETE zstack/v1/tickets/flow-collections/{uuid}?
deleteMode={deleteMode}

```

Headers

```

Authorization: OAuth the-session-uuid

```

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/tickets/flow-
collections/657b0e4c4b21394db32f1c7c1066efa9?deleteMode=Permissive

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.0.0
deleteMode	String	body	Optional. The delete mode.		3.0.0

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	body	Optional. The system tags.		3.0.0
userTags	List	body	Optional. The user tags.		3.0.0

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteTicketFlowCollectionAction action = new DeleteTicketFlowCollectionAction();
action.uuid = "657b0e4c4b21394db32f1c7c1066efa9";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteTicketFlowCollectionAction.Result res = action.call();
```

Python SDK

```
DeleteTicketFlowCollectionAction action = DeleteTicketFlowCollectionAction()
action.uuid = "657b0e4c4b21394db32f1c7c1066efa9"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
DeleteTicketFlowCollectionAction.Result res = action.call()
```

7.1.3.9 UpdateIAM2TicketFlowCollection

API Request

URLs

```
PUT zstack/v1/tickets/flow-collections/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateIAM2TicketFlowCollection": {
    "flows": [
      {
        "name": "flow1",
        "approverUuid": "8603f9c875a23cf1815b85e16f0d972e"
      },
      {
        "name": "flow2",
        "approverUuid": "9563991259ad3820bf48e5d8b86b5da4"
      }
    ]
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateIAM2TicketFlowCollection":{"flows":
[{"name":"flow1","approverUuid":"8603f9c875a23cf1815b85e16f0d972e"},
{"name":"flow2","approverUuid":"9563991259ad3820bf48e5d8b86b5da4"}]}}'
http://localhost:8080/zstack/v1/tickets/flow-
collections/610687f0ec5c3ca286a27fa13888df2e/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
flows	List	body (contained in the updateIAM2 TicketFlow Collection structure)	Optional.		3.0.0
uuid	String	url	The resource UUID.		3.0.0
name	String	body (contained in the updateIAM2 TicketFlow Collection structure)	Optional. The resource name.		3.0.0
description	String	body (contained in the updateIAM2 TicketFlow Collection structure)	Optional. The detailed description of the resource.		3.0.0
isDefault	Boolean	body (contained in the updateIAM2 TicketFlow Collection structure)	Optional.		3.0.0
systemTags	List	body	Optional.		3.0.0
userTags	List	body	Optional.		3.0.0

API Response

Sample Response

```
{
  "inventory": {
```

```

    "uuid": "7db7660049ba42fc95de91ac238145a5",
    "name": "collection name",

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.0.0
description	String	The brief description of the error.	3.0.0
details	String	The details about the error.	3.0.0
elaboration	String	The reserved field. Default value: null.	3.0.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.0.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.0.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.0.0
name	String	The resource name.	3.0.0
description	String	The detailed description of the resource.	3.0.0
parentFlowUuid	String		3.0.0
flowContext	String		3.0.0
flowContextType	String		3.0.0
createDate	Timestamp	The creation date.	3.0.0
lastOpDate	Timestamp	The last operation date.	3.0.0
collectionUuid	String		3.0.0

SDK Sample

Java SDK

```
AddIAM2TicketFlowAction action = new AddIAM2TicketFlowAction();
action.approverUuid = "92b1b555f19531df9a94ce42c8959fa9";
action.approverTitle = "SystemAdmin";
action.name = "example flow";
action.collectionUuid = "4913282e13a64fe29b802c78b67e2c84";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
AddIAM2TicketFlowAction.Result res = action.call();
```

Python SDK

```
AddIAM2TicketFlowAction action = AddIAM2TicketFlowAction()
action.approverUuid = "92b1b555f19531df9a94ce42c8959fa9"
action.approverTitle = "SystemAdmin"
action.name = "example flow"
action.collectionUuid = "12d574495c074cf59de72c911391b8bb"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
AddIAM2TicketFlowAction.Result res = action.call()
```

7.1.3.14 UpdateIAM2TicketFlow

API Request

URLs

```
PUT zstack/v1/tickets/flow/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateIAM2TicketFlow": {
    "name": "new ticket flow name",
    "description": "new ticket flow description",
    "approverUuid": "714d3eedb96f32a39598fb11ae0d9927"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateIAM2TicketFlow":{"name":"new
ticket flow name","description":"new ticket flow
description","approverUuid":"714d3eedb96f32a39598fb11ae0d9927"}}'
http://localhost:8080/zstack/v1/tickets/
flow/919e8fbb3b3b30f480b41563e36839cc/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.0.0
name	String	body (contained in the updateIAM2TicketFlow structure)	Optional. The resource name.		3.0.0
description	String	body(contained in the updateIAM2TicketFlow structure)	Optional. The detailed description of the resource.		3.0.0
approverUuid	String	body (contained in the updateIAM2TicketFlow structure)	Optional.		3.0.0
approverTitle	String	body (contained in the updateIAM2TicketFlow structure)	Optional.		3.0.0
systemTags	List	body	Optional.		3.0.0
userTags	List	body	Optional.		3.0.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "1dc3521c3ec74b81813121404e5941e6",
    "name": "flow1",
    "description": "flow description",
    "parentFlowUuid": "bb2897de253e497f94587fc09b5ef969",
    "flowContextType": "{\\"approverUuid\\":\\"da8cc8c2412246b6b29b38328b7dab88\\"}",
    "createDate": "Dec 28, 2018 6:39:33 PM",
    "lastOpDate": "Dec 28, 2018 6:39:33 PM",
    "collectionUuid": "2b9bdd8b1c1d4163864e55d16840954f"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.0.0
inventory	TicketFlowInventory	See inventory .	3.0.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.0.0
description	String	The brief description of the error.	3.0.0
details	String	The details about the error.	3.0.0
elaboration	String	The reserved field. Default value: null.	3.0.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.0.0

Name	Type	Description	Starting Version
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.0.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.0.0
name	String	The resource name.	3.0.0
description	String	The detailed description of the resource.	3.0.0
parentFlowUuid	String		3.0.0
flowContext	String		3.0.0
flowContextType	String		3.0.0
createDate	Timestamp	The creation date.	3.0.0
lastOpDate	Timestamp	The last operation date.	3.0.0
collectionUuid	String		3.0.0

SDK Sample

Java SDK

```
UpdateIAM2TicketFlowAction action = new UpdateIAM2TicketFlowAction();
action.uuid = "919e8fbb3b3b30f480b41563e36839cc";
action.name = "new ticket flow name";
action.description = "new ticket flow description";
action.approverUuid = "714d3eedb96f32a39598fb11ae0d9927";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateIAM2TicketFlowAction.Result res = action.call();
```

Python SDK

```
UpdateIAM2TicketFlowAction action = UpdateIAM2TicketFlowAction()
action.uuid = "919e8fbb3b3b30f480b41563e36839cc"
action.name = "new ticket flow name"
action.description = "new ticket flow description"
action.approverUuid = "714d3eedb96f32a39598fb11ae0d9927"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
UpdateIAM2TicketFlowAction.Result res = action.call()
```

7.1.3.15 DeleteIAM2TicketFlow

API Request

URLs

```
DELETE zstack/v1/tickets/flow/{uuid}?deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/tickets/
flow/482baf2f2f4f3315b81064ecc5b3625c?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.0.0
deleteMode	String	body	Optional. The delete mode.		3.0.0
systemTags	List	body	Optional. The system tags.		3.0.0
userTags	List	body	Optional. The user tags.		3.0.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DeleteIAM2TicketFlowAction action = new DeleteIAM2TicketFlowAction();
action.uuid = "482baf2f2f4f3315b81064ecc5b3625c";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteIAM2TicketFlowAction.Result res = action.call();
```

Python SDK

```
DeleteIAM2TicketFlowAction action = DeleteIAM2TicketFlowAction()
action.uuid = "482baf2f2f4f3315b81064ecc5b3625c"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteIAM2TicketFlowAction.Result res = action.call()
```

7.1.3.16 AddTicketTypesToTicketFlowCollection

API Request

URLs

```
POST zstack/v1/tickets/flow-collections/{ticketFlowCollectionUuid}/
ticket-types
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "ticketTypeUuids": [
      "3b933e9aaf2d49b9a3dcf0c92867790f",
      "ef064ef45fb446d381db7b7d5f71695c"
    ]
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"ticketTypeUuids":
["3b933e9aaf2d49b9a3dcf0c92867790f","ef064ef45fb446d381db7b7d5f71695c"]}}'
http://localhost:8080/zstack/v1/tickets/flow-
collections/4f4bf50d510f4bf1959d8c5baa218cc4/ticket-types
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
ticketFlow CollectionUuid	String	url	The ticket process UUID.		3.6.0
ticketType Uuids	List	body (contained in the params structure)	The ticket type UUIDs.		3.6.0
systemTags	List	body	Optional. The system tags.		3.6.0
userTags	List	body	Optional. The user tags.		3.6.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
AddTicketTypesToTicketFlowCollectionAction action = new AddTicketTypesToTicketFlowCollectionAction();
action.ticketFlowCollectionUuid = "d8aa14d3ea224e36bd071b2355c94882";
action.ticketTypeUuids = asList("3b933e9aaf2d49b9a3dcf0c92867790f","ef064ef45fb446d381db7b7d5f71695c");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
AddTicketTypesToTicketFlowCollectionAction.Result res = action.call();
```

Python SDK

```
AddTicketTypesToTicketFlowCollectionAction action = AddTicketT
ypesToTicketFlowCollectionAction()
action.ticketFlowCollectionUuid = "5682400944cd4ca0acb82ff8d67462a6"
action.ticketTypeUuids = [3b933e9aaf2d49b9a3dcf0c92867790f, ef064ef45f

action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
AddTicketTypesToTicketFlowCollectionAction.Result res = action.call()
```

7.1.3.17 RemoveTicketTypesFromTicketFlowCollection

API Request

URLs

```
DELETE zstack/v1/tickets/flow-collections/{ticketFlowCollectionUuid}/
ticket-types
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/tickets/flow-
collections/839c88649a804cf6b56f3e80aac1c578/ticket-types
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
ticketFlowCollectionUuid	String	url			3.6.0
ticketTypeUuids	List	body			3.6.0
systemTags	List	body	Optional. The system tags.		3.6.0
userTags	List	body	Optional. The user tags.		3.6.0

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
RemoveTicketTypesFromTicketFlowCollectionAction action = new
RemoveTicketTypesFromTicketFlowCollectionAction();
action.ticketFlowCollectionUuid = "f4ccacf67bb04b4698d01ffbfed57134";
action.ticketTypeUuids = asList("3b933e9aaf2d49b9a3dcf0c92867790f", "
ef064ef45fb446d381db7b7d5f71695c");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
RemoveTicketTypesFromTicketFlowCollectionAction.Result res = action.
call();
```

Python SDK

```
RemoveTicketTypesFromTicketFlowCollectionAction action = RemoveTick
etTypesFromTicketFlowCollectionAction()
action.ticketFlowCollectionUuid = "97e30e33bea34366850c62781d342e22"
action.ticketTypeUuids = [3b933e9aaf2d49b9a3dcf0c92867790f, ef064ef45f

```

Python SDK

```
QueryTicketTypeAction action = QueryTicketTypeAction()
action.conditions = ["uuid=60ebfd64ef4238f9bbdd77c3c0569d64"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryTicketTypeAction.Result res = action.call()
```

7.1.4 SSO Operations

7.1.4.1 CreateIAM2VirtualIDFromLdapUid

API Request

URLs

```
POST zstack/v1/iam2/virtual-id/ldap/uid
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "ldapUid": "ou\u003dEmployee,uid\u003dtest"
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"ldapUid":"ou=Employee,uid=test"}}' http://
localhost:8080/zstack/v1/iam2/virtual-id/ldap/uid
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
ldapUid	String	body (contained in the params structure)	The AD/LDAP user UUID.		4.7.0
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		4.7.0
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID list.		4.7.0
systemTags	List	body	Optional. The system tags.		3.5.1
userTags	List	body	Optional. The user tags.		3.5.1

API Response**Sample Response**

```
{
  "inventory": {
    "uuid": "417c94a9fdfb3b61b2e0d11ed42f4b4d",

  }
}
```

Name	Type	Description	Starting Version
success	boolean		4.7.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.5.1
inventory	LdapIAM2VirtualIDRef Inventory	See inventory .	3.5.1

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.5.1
description	String	The brief description of the error.	3.5.1
details	String	The details about the error.	3.5.1
elaboration	String	The reserved field. Default value: null.	3.5.1
opaque	LinkedHashMap	The reserved field. Default value: null.	3.5.1
cause	ErrorCode	The root error, which is the associated root	3.5.1

Name	Type	Description	Starting Version
		cause of the current error. If no root error exists, this parameter is null.	

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.5.1
ldapUid	String	The AD/LDAP entry UID.	3.5.1
ldapServerUuid	String	The AD/LDAP server UUID.	3.5.1
resourceUuid	String	The UUID of the associated resource.	3.5.1
createDate	Timestamp	The creation date.	3.5.1
lastOpDate	Timestamp	The last operation date.	3.5.1

SDK Sample

Java SDK

```
CreateIAM2VirtualIDLdapBindingAction action = new CreateIAM2VirtualIDLdapBindingAction();
action.virtualIDUuid = "52d9727518053f50889bebe14617d2d2";
action.ldapUid = "ou=Employee,uid=test";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateIAM2VirtualIDLdapBindingAction.Result res = action.call();
```

Python SDK

```
CreateIAM2VirtualIDLdapBindingAction action = CreateIAM2VirtualIDLdapBindingAction()
action.virtualIDUuid = "52d9727518053f50889bebe14617d2d2"
action.ldapUid = "ou=Employee,uid=test"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
CreateIAM2VirtualIDLdapBindingAction.Result res = action.call()
```

7.1.4.3 GetCandidateLdapEntryForIAM2Binding

API Request

URLs

```
GET zstack/v1/iam2/ldap/entries/candidates
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/iam2/ldap/entries/candidates?
ldapFilter=(cn=user_xxx)&limit=2500.0
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
ldapFilter	String	query	The AD/LDAP query filter.		3.5.1
limit	Integer	query	Optional. The limit of AD/LDAP query entries.		3.5.1
systemTags	List	query	Optional. The system tags.		3.5.1
userTags	List	query	Optional. The user tags.		3.5.1

API Response

Sample Response

```
{
  "inventories": []
}
```

}

Name	Type	Description	Starting Version
inventories	List		3.5.1
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.5.1

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.5.1
description	String	The brief description of the error.	3.5.1
details	String	The details about the error.	3.5.1
elaboration	String	The reserved field. Default value: null.	3.5.1
opaque	LinkedHashMap	The reserved field. Default value: null.	3.5.1
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.5.1

SDK Sample

Java SDK

```
GetCandidateLdapEntryForIAM2BindingAction action = new GetCandidateLdapEntryForIAM2BindingAction();
action.ldapFilter = "(cn=user_xxx)";
action.limit = 2500.0;
```

```
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetCandidateLdapEntryForIAM2BindingAction.Result res = action.call();
```

Python SDK

```
GetCandidateLdapEntryForIAM2BindingAction action = GetCandida
teLdapEntryForIAM2BindingAction()
action.ldapFilter = "(cn=user_xxx)"
action.limit = 2500.0
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetCandidateLdapEntryForIAM2BindingAction.Result res = action.call()
```

7.1.4.4 LoginIAM2VirtualIDWithLdap

API Request

URLs

```
PUT zstack/v1/iam2/login/virtual-ids/ldap
```

Body

```
{
  "loginIAM2VirtualIDWithLdap": {
    "uid": "ou\u003dEmployee,uid\u003dtest",
    "password": "password"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-X PUT -d '{"loginIAM2VirtualIDWithLdap":
{"uid":"ou=Employee,uid=test", "password":"password"}}' http://
localhost:8080/zstack/v1/iam2/login/virtual-ids/ldap
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uid	String	body (contained in the loginIAM2V	The login attribute value		3.5.1

Name	Type	Location	Description	Optional Value	Starting Version
		virtualIDWithLdap structure)	of the AD/LDAP user.		
password	String	body (contained in the loginIAM2VirtualIDWithLdap structure)	The login password of the AD/LDAP user.		3.5.1
verifyCode	String	body (contained in the loginIAM2VirtualIDWithLdap structure)	Optional. The login verification code.		3.5.1
captchaUuid	String	body (contained in the loginIAM2VirtualIDWithLdap structure)	Optional. The UUID of the login authentication code.		3.5.1
systemTags	List	body	Optional. The system tags.		3.5.1
userTags	List	body	Optional. The user tags.		3.5.1

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "4abb254913c23d488c161bcd3524f176",
    "accountUuid": "ac1453a45c6830c6ad6d488326a4c0ec",
    "expiredDate": "Nov 14, 2017 10:20:57 PM",
    "noSessionEvaluation": false
  }
}
```

}

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.5.1
inventory	SessionInventory	See inventory .	3.5.1

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.5.1
description	String	The brief description of the error.	3.5.1
details	String	The details about the error.	3.5.1
elaboration	String	The reserved field. Default value: null.	3.5.1
opaque	LinkedHashMap	The reserved field. Default value: null.	3.5.1
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.5.1

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.5.1
accountUuid	String	The account UUID.	3.5.1

Name	Type	Description	Starting Version
userUuid	String	The user UUID.	3.5.1
expiredDate	Timestamp		3.5.1
createDate	Timestamp	The creation date.	3.5.1

SDK Sample

Java SDK

```
LoginIAM2VirtualIDWithLdapAction action = new LoginIAM2VirtualIDWithLdapAction();
action.uid = "ou=Employee,uid=test";
action.password = "password";
LoginIAM2VirtualIDWithLdapAction.Result res = action.call();
```

Python SDK

```
LoginIAM2VirtualIDWithLdapAction action = LoginIAM2VirtualIDWithLdapAction()
action.uid = "ou=Employee,uid=test"
action.password = "password"
LoginIAM2VirtualIDWithLdapAction.Result res = action.call()
```

7.1.4.5 DeleteIAM2VirtualIDLdapBinding

API Request

URLs

```
DELETE /v1/iam2/ldap/bindings/{uuid}?deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/iam2/ldap/bindings/0a7983d3082530c4b6d4b844e694694e?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.5.1

Name	Type	Location	Description	Optional Value	Starting Version
deleteMode	String	body	Optional. The delete mode.		3.5.1
systemTags	List	body	Optional. The system tags.		3.5.1
userTags	List	body	Optional. The user tags.		3.5.1

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteIAM2VirtualIDLdapBindingAction action = new DeleteIAM2VirtualIDLdapBindingAction();
action.uuid = "0a7983d3082530c4b6d4b844e694694e";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteIAM2VirtualIDLdapBindingAction.Result res = action.call();
```

Python SDK

```
DeleteIAM2VirtualIDLdapBindingAction action = DeleteIAM2VirtualIDLdapBindingAction()
action.uuid = "0a7983d3082530c4b6d4b844e694694e"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
DeleteIAM2VirtualIDLdapBindingAction.Result res = action.call()
```

7.1.4.6 CleanInvalidLdapIAM2Binding

API Request

URLs

```
PUT zstack/v1/iam2/ldap/bindings/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "cleanInvalidLdapIAM2Binding": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"cleanInvalidLdapIAM2Binding":{}}' http://
localhost:8080/zstack/v1/iam2/ldap/bindings/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	body	Optional. The system tags.		3.5.1
userTags	List	body	Optional. The user tags.		3.5.1

API Response

Sample Response

```
{
  "inventories": [
```

```

logouturl", "scopeList": ["d8f4a70ef87b35c986336a88dd5bafd1"]]]}' http://localhost:8080/zstack/v1/update/oauth2/client
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	body (contained in the params structure)	The resource UUID.		4.5.0
name	String	body (contained in the params structure)	Optional. The resource name.		4.5.0
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		4.5.0
clientId	String	body (contained in the params structure)	Optional. The client ID.		4.5.0
clientSecret	String	body (contained in the params structure)	Optional. The client key.		4.5.0
authorizationUrl	String	body (contained in the params structure)	Optional. The authentication url.		4.5.0
tokenUrl	String	body (contained in the params structure)	The authentication token url.		4.5.0
loginType	String	body (contained in the params structure)	The login type: - cas-iam1 - cas-ima2 - oauth2-iam1		4.5.0

Name	Type	Location	Description	Optional Value	Starting Version
			oauth2-iam2		
systemTags	List	body	Optional. The system tag.		4.5.0
userTags	List	body	Optional. The user tag.		4.5.0
redirectUrl	String	body (contained in the params structure)	Optional. User information url.		4.7.21
userinfoUrl	String	body (contained in the params structure)	Optional. User redirect url.		4.7.21
logoutUrl	String	body (contained in the params structure)	Optional. Logout url.		4.7.21
scopeList	List	body (contained in the params structure)	Optional. The permission scope.		5.1.8
identityProvider	String	body (contained in the params structure)	Optional. The identity provider.		5.1.8
pluginUuid (可选)	String	body (contained in the params structure)	The plugin UUID.		5.3.20

API Response

Sample Response

```

}
}

```

Name	Type	Description	Starting Version
success	boolean		4.6.21
inventory	OAuth2TokenInventory	See inventory .	4.6.21
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.6.21

#inventory

Name	Type	Description	Starting Version
accessToken	String	The access token.	4.6.21
idToken	String	The id token.	4.6.21
refreshToken	String	The refresh token.	4.6.21
uuid	String	The resource UUID.	4.6.21
clientUuid	String	The client UUID.	4.6.21

Name	Type	Description	Starting Version
userId	String	The user UUID.	4.6.21
createDate	Timestamp	The creation date.	4.6.21
lastOpDate	Timestamp	The last operation date.	4.6.21

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.6.21
description	String	The brief description of the error.	4.6.21
details	String	The details about the error.	4.6.21
elaboration	String	The reserved field. Default value: null.	4.6.21
opaque	LinkedHashMap	The reserved field. Default value: null.	4.6.21
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.6.21

SDK Sample

Java SDK

```
GetOAuth2TokenAction action = new GetOAuth2TokenAction();
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetOAuth2TokenAction.Result res = action.call();
```

Python SDK

```
GetOAuth2TokenAction action = GetOAuth2TokenAction()
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
GetOAuth2TokenAction.Result res = action.call()
```

7.1.4.12 CreateCasClient

API Request

URLs

```
POST zstack/v1/create/cas/client
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "test",
    "description": "test",
    "casServerLoginUrl": "http://zstack.com/login",
    "casServerUrlPrefix": "http://zstack.com",
    "serverName": "http://127.0.0.1:8080",
    "loginType": "iam1"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \-X POST -d
'{"params":
{"name":"test","description":"test","casServerLoginUrl":"http://zstack.com/
login","casServerUrlPrefix":"http://zstack.com","serverName":"http://127.0.0.1:80
\
http://localhost:8080/zstack/v1/create/cas/client
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in	The resource name.		4.5.0

Name	Type	Location	Description	Optional Value	Starting Version
		the params structure)			
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		4.5.0
casServerLoginUrl	String	body (contained in the params structure)	casServerLoginUrl.		4.5.0
casServerUrlPrefix	String	body (contained in the params structure)	casServerUrlPrefix.		4.5.0
serverName	String	body (contained in the params structure)	The mn address (http://{mn_ip:port}/8080).		4.5.0
loginType	String	body (contained in the params structure)	The login type: - cas-iam1 - cas-ima2 - oauth2-iam1 - oauth2-iam2		4.5.0
urlTemplate (可选)	String	body (contained in the params structure)	Optional. The address skipped to after the password-free login.		4.5.0
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		4.5.0

Name	Type	Location	Description	Optional Value	Starting Version
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID list.		4.5.0
systemTags	List	body	Optional. The system tag.		4.5.0
userTags	List	body	Optional. The user tag.		4.5.0

API Response

Sample Response

```
{
  "inventory": {
    "casServerUrlPrefix": "http://zstack.com",
    "serverName": "http://127.0.0.1",
    "state": "Enabled",

Name	Type	Description	Starting Version
Enabled	CasState		4.5.0
Disabled	CasState		4.5.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.5.0
description	String	The brief description of the error.	4.5.0

Name	Type	Description	Starting Version
details	String	The details about the error.	4.5.0
elaboration	String	The reserved field. Default value: null.	4.5.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.5.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.5.0

SDK Sample

Java SDK

```
CreateCasClientAction action = new CreateCasClientAction();
action.name = "test";
action.description = "test";
action.casServerLoginUrl = "http://zstack.com/login";
action.casServerUrlPrefix = "http://zstack.com";
action.serverName = "http://127.0.0.1:8080";
action.loginType = "iam1";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateCasClientAction.Result res = action.call();
```

Python SDK

```
CreateCasClientAction action = CreateCasClientAction()
action.name = "test"
action.description = "test"
action.casServerLoginUrl = "http://zstack.com/login"
action.casServerUrlPrefix = "http://zstack.com"
action.serverName = "http://127.0.0.1:8080"
action.loginType = "iam1"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
CreateCasClientAction.Result res = action.call()
```

7.1.4.13 UpdateCasClient

API Request

URLs

```
POST zstack/v1/update/cas/client
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "uuid": "c9b85d8d64353f89a0fc97833dbda36e",
    "description": "test",
    "name": "test",

Name	Type	Description	Starting Version
		exists, this parameter is null.	

SDK Sample

Java SDK

```
UpdateCasClientAction action = new UpdateCasClientAction();
action.uuid = "c9b85d8d64353f89a0fc97833dbda36e";
action.description = "test";
action.name = "test";
action.casServerLoginUrl = "http://zstack.com/login";
action.casServerUrlPrefix = "http://zstack.com";
action.serverName = "http://127.0.0.1:8080";
action.loginType = "iam1";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateCasClientAction.Result res = action.call();
```

Python SDK

```
UpdateCasClientAction action = UpdateCasClientAction()
action.uuid = "c9b85d8d64353f89a0fc97833dbda36e"
action.description = "test"
action.name = "test"
action.casServerLoginUrl = "http://zstack.com/login"
action.casServerUrlPrefix = "http://zstack.com"
action.serverName = "http://127.0.0.1:8080"
action.loginType = "iam1"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateCasClientAction.Result res = action.call()
```

7.1.4.14 DeleteSSOClient

API Request

URLs

```
POST zstack/v1/delete/sso/client
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "uuid": "3e54cb2e27ff31dda2c49851bf2662d2",
    "deleteMode": "Permissive"
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl示例

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"uuid":"3e54cb2e27ff31dda2c49851bf2662d2","deleteMode":"Permissive"}}'
http://localhost:8080/zstack/v1/delete/sso/client
```

参数列表

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	body (contained in the params structure)	The resource UUID.		4.5.0
deleteMode	String	body (contained in the params structure)	Optional. The deletion mode: • Permissive • Enforcing, Permissive		4.5.0
systemTags	List	body	Optional. The system tag.		4.5.0
userTags	List	body	Optional. The user tag.		4.5.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DeleteSSOClientAction action = new DeleteSSOClientAction();
action.uuid = "3e54cb2e27ff31dda2c49851bf2662d2";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteSSOClientAction.Result res = action.call();
```

Python SDK

```
DeleteSSOClientAction action = DeleteSSOClientAction()
action.uuid = "3e54cb2e27ff31dda2c49851bf2662d2"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteSSOClientAction.Result res = action.call()
```

7.1.4.15 GetSSOClient

API Request

URLs

```
GET zstack/v1/get/sso/client
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-X GET http://localhost:8080/zstack/v1/get/sso/client
```

Required Parameters

Name	Type	Location	Description	Valid Values	Starting Version
systemTags	List	body	Optional. The system tags.		4.6.21
userTags	List	body	Optional. The user tags.		4.6.21

API Response

Response Sample

```
{
  "inventories": [
    {
      "uuid": "1fbb7c4cb98d38beb31fa9bd74bffa347",
      "name": "test",
      "clientType": "OIDC",
      "loginMNUrl": "http://127.0.0.1:8080/zstack/sso/oauth2/"
    }
  ]
}
```

Name	Type	Description	Starting Version
success	boolean		4.6.21

description	String	The resource description.	4.6.21
clientType	String	The client type.	4.6.21
loginType	String	The login type.	4.6.21
loginMNUrl	String	The url skipped to after the login.	4.6.21
createDate	Timestamp	The creaion date.	4.6.21
lastOpDate	Timestamp	The last operation date.	4.6.21
accountUuid	String	The account UUID.	4.6.21

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	4.6.21
description	String	The brief description of the error.	4.6.21
details	String	The details about the error.	4.6.21
elaboration	String	The reserved field. Default value: null.	4.6.21
opaque	LinkedHashMap	The reserved field. Default value: null.	4.6.21
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.6.21

SDK Sample

Java SDK

```
GetSSOClientAction action = new GetSSOClientAction();
GetSSOClientAction.Result res = action.call();
```

Python SDK

```
GetSSOClientAction action = GetSSOClientAction()
```

```
GetSSOClientAction.Result res = action.call()
```

7.1.4.16 UpdateSSORedirectTemplate

API Request

URLs

```
POST zstack/v1/update/sso/redirectTemplate
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "uuid": "35cc6909f0f23e55a209cd552d8bc938",
    "redirectTemplate": "http://zstack.com/userinfoUrl"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8"
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c"
-X POST -d '{"params":
{"uuid":"35cc6909f0f23e55a209cd552d8bc938","redirectTemplate":"http://zstack.com/
userinfoUrl"}}'
http://localhost:8080/zstack/v1/update/sso/redirectTemplate
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	body (contained in the params structure)	The resource UUID.		4.7.21

Name	Type	Location	Description	Optional Value	Starting Version
redirectTemplate	String	body (contained in the params structure)	The UI redirect address.		4.7.21
systemTags	List	body	Optional. The system tags.		4.7.21
userTags	List	body	Optional. The user tags.		4.7.21

API Response

Response Sample

```
{
  "inventory": {
    "uuid": "43679041066d37b28f676a49851ade69",
    "clientUuid": "3e5541e27b9c320fa4ad0a86777cc5ab",
    "redirectTemplate": "http://zstack.com/code"
  }
}
```

Name	Type	Description	Starting Version
success	boolean		4.7.21
inventory	OAuth2ClientInventory	See inventory .	4.7.21
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.7.21

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	4.7.21
name	String	The resource name.	4.7.21
description	String	The detailed description of the resource.	4.7.21
clientUuid	String	The client uuid.	4.7.21

Name	Type	Description	Starting Version
redirectTemplate	String	The redirect template.	4.7.21
createDate	Timestamp	The creation date.	4.7.21
lastOpDate	Timestamp	The last operation date.	4.7.21

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.7.21

UpdateSSORedirectTemplateAction.Result res = action.call()
```

7.2 Billing Management Operations

7.2.1 CreateResourcePrice

API Request

URLs

```
POST zstack/v1/billings/prices
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "resourceName": "cpu",
    "timeUnit": "s",
    "price": 100.0,
    "dateInLong": 0.0
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth cc882c434d65428091449452ab5eb2e3" \
-X POST -d '{"params":
{"resourceName":"cpu","timeUnit":"s","price":100.0,"dateInLong":0.0}}'
```

`http://localhost:8080/zstack/v1/billings/prices`

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
resourceName	String	body (contained in the params structure)	The resource name.	- cpu - memory - rootvolume - datavolume - snapshot - gpu - pubIpVmNicBandwidthOut - pubIpVmNicBandwidthIn - pubIpVipBandwidthOut - pubIpVipBandwidthIn	0.6
resourceUnit	String	body (contained in the params structure)	Optional. The billing unit of the resource.	This parameter can be decided according to resourceName.	0.6
timeUnit	String	body (contained in the params structure)	The billing time unit.		0.6
price	double	body (contained in the params structure)	The unit price.		0.6
accountUuid	String	body (contained in the params structure)	Optional. The account UUID.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
dateInLong	Long	body (contained in the params structure)	Optional. The long-integer time.		0.6
tableUuid	String	body (contained in the params structure)	Optional. The price table UUID.		3.7.2
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

**Note:**

- When you create a resource price in ZStack Cloud, you can specify a PCI device by adding the **PCI device** option to **SystemTags**.
 - Format of the **PCI device** option: `gpuOfferingUuid::UUID`
 - Example: `gpuOfferingUuid::634b48a7bca139d9944a0f95b0c2dddf`
- When you create a resource price in ZStack Cloud, you can define the resource billing type by adding the **priceUserConfig** option to **SystemTags**.
 - Format of the **priceUserConfig** option: `priceUserConfig::xxx`. Here, xxx must be a JSON string.

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "437ade61b17e4c658844fdacfb0fc6de",
    "resourceName": "Volume",
    "resourceUnit": "1",
    "timeUnit": "s",
    "price": 2.0
  }
}
```

}

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventory	PriceInventory	See inventory .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
resourceName	String	The resource name.	0.6

Name	Type	Description	Starting Version
resourceUnit	String	The billing unit of the resource.	0.6
timeUnit	String	The billing time unit.	0.6
price	Double	The unit price.	0.6
dateInLong	Long	The long-integer time.	0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6
tableUuid	String	The price table UUID.	3.7.1
pciDeviceOfferings	List	See pciDeviceOfferings .	2.4

#pciDeviceOfferings

Name	Type	Description	Starting Version
priceUuid	String		2.4
pciDeviceOfferingUuid	String		2.4
createDate	Timestamp	The creation date.	2.4
lastOpDate	Timestamp	The last operation date.	2.4

SDK Sample

Java SDK

```
CreateResourcePriceAction action = new CreateResourcePriceAction();
action.resourceName = "cpu";
action.timeUnit = "s";
action.price = 100.0;
action.dateInLong = 0.0;
action.sessionId = "1360cf066fd547b9ae2d8f32beba717f";
CreateResourcePriceAction.Result res = action.call();
```

Python SDK

```
CreateResourcePriceAction action = CreateResourcePriceAction()
action.resourceName = "cpu"
action.timeUnit = "s"
action.price = 100.0
action.dateInLong = 0.0
action.sessionId = "47ca95d22d8645ef8aef8dd0110cbd92"
```

```
CreateResourcePriceAction.Result res = action.call()
```

7.2.2 DeleteResourcePrice

API Request

URLs

```
DELETE zstack/v1/billings/prices/{uuid}?deleteMode={deleteMode}
```

Headers

```
OAuth: the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "OAuth: 5332b02080a141cc961457ad3b090fe4" \
-X DELETE http://localhost:8080/zstack/v1/billings/prices/
a5c5bd6198824d89894cdd10969843ffdeleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
deleteMode	String	url	Optional. The delete mode.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DeleteResourcePriceAction action = new DeleteResourcePriceAction();
action.uuid = "6a7c1ad952894d5aa2cc6b1add3062ca";
action.deleteMode = "Permissive";
action.sessionId = "e3ffecc95a5b4bcca5ce212826a14ee0";
DeleteResourcePriceAction.Result res = action.call();
```

Python SDK

```
DeleteResourcePriceAction action = DeleteResourcePriceAction()
action.uuid = "14c4eef2f36e4716a279777e503ab772"
action.deleteMode = "Permissive"
action.sessionId = "fcbca45ec9454200b1d080b0268c17d9"
DeleteResourcePriceAction.Result res = action.call()
```

7.2.3 UpdateResourcePrice

API Request

URLs

```
PUT zstack/v1/billings/prices/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateResourcePrice": {
    "setEndDateInLongBaseOnCurrentTime": false
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateResourcePrice":
{"setEndDateInLongBaseOnCurrentTime":false}}'
```

```
http://localhost:8080/zstack/v1/billings/prices/
bed31eb3ba76325ba6a1cef1a64c97a3/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource price UUID.		3.7.2
endDateInLong	Long	body (contained in the updateResourcePrice structure)	Optional. The resource price expiration date.		3.7.2
setEndDateInLongBasedOnCurrentTime	boolean	body (contained in the updateResourcePrice structure)	Optional. Sets the resource price expiration date to the current time.		3.7.2
systemTags	List	body	Optional. The system tags.		3.7.2
userTags	List	body	Optional. The user tags.		3.7.2

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "d7d2b639707c3e158f9f94cdfff8dc88",
    "resourceName": "Volume",
    "resourceUnit": "1",
    "timeUnit": "s",
    "price": 2.0,
    "dateInLong": 1.510669257141E12,
    "endDateInLong": 1.511029257141E12
  }
}
```

SDK Sample

Java SDK

```
UpdateResourcePriceAction action = new UpdateResourcePriceAction();
action.uuid = "bed31eb3ba76325ba6a1cef1a64c97a3";
action.setEndDateInLongBaseOnCurrentTime = false;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateResourcePriceAction.Result res = action.call();
```

Python SDK

```
UpdateResourcePriceAction action = UpdateResourcePriceAction()
action.uuid = "bed31eb3ba76325ba6a1cef1a64c97a3"
action.setEndDateInLongBaseOnCurrentTime = false
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
UpdateResourcePriceAction.Result res = action.call()
```

7.2.4 QueryResourcePrice

API Request

URLs

```
GET zstack/v1/billings/prices
GET zstack/v1/billing/prices/{uuid}
```

Headers

```
OAuth: the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "OAuth: 0898d6895f274f83bc9d7fe85c629fc2" \
-X GET http://localhost:8080/zstack/v1/billings/prices?
q=uuid=e7a8c15058f2450dbae8a52bc3a53163
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "OAuth: 1e19b0c2877343e8b5cc27ba801cea5b" \
-X GET http://localhost:8080/zstack/v1/billing/
prices/9b1cb8fcb98a4a77b8d1b8f5c71f3ea0
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryResourcePrice`, and pressing the Tab key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "uuid": "127da3fe2612443187bdb5cc1c0a1b93",
      "resourceName": "Volume",
      "resourceUnit": "1",
      "timeUnit": "s",
      "price": 2.0
    }
  ]
}
```

```

7.2.5 CalculateAccountSpending

API Request

URLs

```
PUT zstack/v1/billings/accounts/{accountUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "calculateAccountSpending": {
    "dateStart": 0.0,
    "dateEnd": 1.49448017929E12
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b0422700ba91425aa234b7ad4d70e8ce" \
-X PUT -d '{"calculateAccountSpending":
{"dateStart":0.0,"dateEnd":1.510669257141E12}}' \
http://localhost:8080/zstack/v1/billings/
accounts/64df7cc87c583f069400e5184175d025/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
accountUuid	String	body (contained in the calculateAccountSpending	The account UUID.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
		ding structure)			
dateStart	Long	body (contained in the calculateAccountSpending structure)	Optional. The start date.		0.6
dateEnd	Long	body (contained in the calculateAccountSpending structure)	Optional. The end date.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "total": 200.0,
  "spending": [
    {
      "spending": 0.0,
      "details": []
    }
  ]
}
```

Name	Type	Description	Starting Version
total	double	The total amount.	0.6
success	boolean	Whether the API succeeds.	0.6
error	ErrorCode	The error code. If not null, the operation	0.6

Name	Type	Description	Starting Version
		fails, or vice versa. For more information, see error .	
spending	List	See spending .	0.6
error	ErrorCode	See error .	0.6

#error

type	String	The type.	0.6

SDK Sample

Java SDK

```
CalculateAccountSpendingAction action = new CalculateAccountSpendingAction();
action.accountUuid = "b9578ee43e1745aaaddf96b2286d8055";
action.dateStart = 0.0;
action.dateEnd = 1.494480179344E12;
action.sessionId = "21b88c2399054090b13ac0b9fe067f75";
CalculateAccountSpendingAction.Result res = action.call();
```

Python SDK

```
CalculateAccountSpendingAction action = CalculateAccountSpendingAction()
action.accountUuid = "881b1c4a85bf43f39acc29d42a9c6cd6"
action.dateStart = 0.0
action.dateEnd = 1.494480179344E12
action.sessionId = "a5ae231847c14c26b62bed6e878d6c60"
CalculateAccountSpendingAction.Result res = action.call()
```

7.2.6 QueryAccountBilling

API Request

URLs

```
GET zstack/v1/billing/billings
```

```
GET zstack/v1/billing/billings/{id}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/billing/billings?
q=accountUuid=3897826bada53c65bab2298c3adf69ea
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/billing/billings/{id}?
q=accountUuid=e0936c43a701362189fa71031084d9dd
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryAccountBilling**, and pressing the Tab key.

Note:

QueryAccountBilling only queries all bills, you can use **CalculateAccountSpending** to query bills by time.

API Response

Sample Response

```
{
  "inventories": [
    {
      "id": 1.0,
      "billingType": "DataVolume",
      "accountUuid": "9d0795db99e93ed49f8bc433dd54cf0e",

SDK Sample

Java SDK

```
QueryAccountBillingAction action = new QueryAccountBillingAction();
action.conditions = asList("accountUuid=e2ce4c1abea43ac68927e62c31039a81");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryAccountBillingAction.Result res = action.call();
```

Python SDK

```
QueryAccountBillingAction action = QueryAccountBillingAction()
action.conditions = ["accountUuid=9cbd77ea314a3308bfabed7f7b9c1d1c"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryAccountBillingAction.Result res = action.call()
```

7.2.7 CreatePriceTable

API Request

URLs

```
POST zstack/v1/billings/price-tables
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "table_1",
    "prices": [
      {
        "resourceName": "cpu",
        "timeUnit": "s",
        "price": 10.0
      }
    ]
  }
}
```

```

    }
  ],
  "systemTags": [],
  "userTags": []
}

```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"name":"table_1","prices":
[{"resourceName":"cpu","timeUnit":"s","price":10.0}]}}' http://
localhost:8080/zstack/v1/billings/price-tables

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The name of the price table.		3.7.2
description	String	body (contained in the params structure)	Optional. The detailed description of the price table.		3.7.2
prices	List	body (contained in the params structure)			3.7.2
resourceUuid	String	body (contained in the params structure)	Optional. The price table UUID.		3.7.2

cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.7.2

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.7.2
name	String	The name of the price table.	3.7.2
description	String	The detailed description of the price table.	3.7.2
createDate	Timestamp	The creation date.	3.7.2
lastOpDate	Timestamp	The last operation date.	3.7.2

SDK Sample

Java SDK

```
CreatePriceTableAction action = new CreatePriceTableAction();
action.name = "table_1";
action.prices = asList([resourceName:cpu, timeUnit:s, price:10.0]);
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreatePriceTableAction.Result res = action.call();
```

Python SDK

```
CreatePriceTableAction action = CreatePriceTableAction()
action.name = "table_1"
action.prices = [[resourceName:cpu, timeUnit:s, price:10.0]]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
CreatePriceTableAction.Result res = action.call()
```

7.2.8 DeletePriceTable

API Request

URLs

```
DELETE zstack/v1/billings/price-tables/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/billings/price-
tables/81bd5aa16d203ca39bc5e79e2bbc6de2
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The price table UUID.		3.7.2
systemTags	List	body	Optional. The system tags.		3.7.2
userTags	List	body	Optional. The user tags.		3.7.2

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DeletePriceTableAction action = new DeletePriceTableAction();
action.uuid = "81bd5aa16d203ca39bc5e79e2bbc6de2";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeletePriceTableAction.Result res = action.call();
```

Python SDK

```
DeletePriceTableAction action = DeletePriceTableAction()
action.uuid = "81bd5aa16d203ca39bc5e79e2bbc6de2"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeletePriceTableAction.Result res = action.call()
```

7.2.9 UpdatePriceTable

API Request

URLs

```
PUT zstack/v1/billings/price-tables/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updatePriceTable": {
    "name": "table_1"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updatePriceTable":{"name":"table_1","prices":
[{"resourceName":"cpu","timeUnit":"s","price":10.0}]}}'
```

```
http://localhost:8080/zstack/v1/billings/price-tables/
f1bb8cafaf1c34608582027ee823ea96/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The price table UUID.		3.7.2
name	String	body (contained in the updatePriceTable structure)	Optional. The name of the price table.		3.7.2
description	String	body (contained in the updatePriceTable structure)	Optional. The detailed description of the price table.		3.7.2
systemTags	List	body	Optional. The system tags.		3.7.2
userTags	List	body	Optional. The user tags.		3.7.2

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "c52a6ec9d6a033daa5305a19f13448ac",
    "name": "price table",
    "createDate": "Nov 14, 2017 10:20:57 PM",
    "lastOpDate": "Nov 14, 2017 10:20:57 PM"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For	3.7.2

Name	Type	Description	Starting Version
		more information, see error .	
inventory	PriceTableInventory	See inventory .	3.7.2

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.7.2
description	String	The brief description of the error.	3.7.2
details	String	The details about the error.	3.7.2
elaboration	String	The reserved field. Default value: null.	3.7.2
opaque	LinkedHashMap	The reserved field. Default value: null.	3.7.2
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.7.2

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.7.2
name	String	The name of the price table.	3.7.2
description	String	The detailed description of the price table.	3.7.2
createDate	Timestamp	The creation date.	3.7.2

Name	Type	Description	Starting Version
lastOpDate	Timestamp	The last operation date.	3.7.2

SDK Sample

Java SDK

```
UpdatePriceTableAction action = new UpdatePriceTableAction();
action.uuid = "f1bb8cafaf1c34608582027ee823ea96";
action.name = "table_1";
action.prices = asList([resourceName:cpu, timeUnit:s, price:10.0]);
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdatePriceTableAction.Result res = action.call();
```

Python SDK

```
UpdatePriceTableAction action = UpdatePriceTableAction()
action.uuid = "f1bb8cafaf1c34608582027ee823ea96"
action.name = "table_1"
action.prices = [[resourceName:cpu, timeUnit:s, price:10.0]]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdatePriceTableAction.Result res = action.call()
```

7.2.10 QueryPriceTable

API Request

URLs

```
GET zstack/v1/billings/price-tables
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/billings/price-tables?
q=uuid=2cc88ae55ad13572a5ab9022a204a7af
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryPriceTable**, and pressing the Tab key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "uuid": "3e78d076698438a6a68aa2eabdde8adf",
      "name": "price table",
      "createDate": "Nov 14, 2017 10:20:57 PM",
      "lastOpDate": "Nov 14, 2017 10:20:57 PM"
    }
  ]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.7.2
inventories	List	See inventories .	3.7.2

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.7.2
description	String	The brief description of the error.	3.7.2
details	String	The details about the error.	3.7.2
elaboration	String	The reserved field. Default value: null.	3.7.2
opaque	LinkedHashMap	The reserved field. Default value: null.	3.7.2
cause	ErrorCode	The root error, which is the associated root cause of the current	3.7.2

Name	Type	Description	Starting Version
		error. If no root error exists, this parameter is null.	

#inventories

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.7.2
name	String	The name of the price table.	3.7.2
description	String	The detailed description of the price table.	3.7.2
createDate	Timestamp	The creation date.	3.7.2
lastOpDate	Timestamp	The last operation date.	3.7.2

SDK Sample

Java SDK

```
QueryPriceTableAction action = new QueryPriceTableAction();
action.conditions = asList("uuid=86b5cece6d0f3534a0a995ab8e60289f");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryPriceTableAction.Result res = action.call();
```

Python SDK

```
QueryPriceTableAction action = QueryPriceTableAction()
action.conditions = ["uuid=ab7f7715bdeb3a04964790c3fdfac20d"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
QueryPriceTableAction.Result res = action.call()
```

7.2.11 AttachPriceTableToAccount

API Request

URLs

```
POST zstack/v1/billings/price-tables/{tableUuid}/accounts/
{accountUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl示例

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{}}' http://localhost:8080/zstack/v1/
billings/price-tables/e32698fcb57d34d68bbf1c4963af95a0/accounts/
f354e135276d3e77a46f47c5c0e47b1a
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
accountUuid	String	url	The account UUID.		3.7.2
tableUuid	String	url	The price table UUID.		3.7.2
tagUuids	List	body	Optional. The tag UUID list.		3.7.2

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	body	Optional. The system tags.		3.7.2
userTags	List	body	Optional. The user tags.		3.7.2

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "8d73a258e3973399a8bcfa2164604705"
  }
}
```

Name	Type	Description	Starting Version
success	boolean		4.7.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.7.2
inventory	PriceTableInventory	See inventory .	3.7.2

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.7.2
description	String	The brief description of the error.	3.7.2
details	String	The details about the error.	3.7.2
elaboration	String	The reserved field. Default value: null.	3.7.2

Name	Type	Description	Starting Version
opaque	LinkedHashMap	The reserved field. Default value: null.	3.7.2
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.7.2

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.7.2
name	String	The name of the price table.	3.7.2
description	String	The detailed description of the price table.	3.7.2
createDate	Timestamp	The creation date.	3.7.2
lastOpDate	Timestamp	The last operation date.	3.7.2

SDK Sample

Java SDK

```
AttachPriceTableToAccountAction action = new AttachPriceTableToAccountAction();
action.accountUuid = "f354e135276d3e77a46f47c5c0e47b1a";
action.tableUuid = "e32698fcb57d34d68bbf1c4963af95a0";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
AttachPriceTableToAccountAction.Result res = action.call();
```

Python SDK

```
AttachPriceTableToAccountAction action = AttachPriceTableToAccountAction()
action.accountUuid = "f354e135276d3e77a46f47c5c0e47b1a"
action.tableUuid = "e32698fcb57d34d68bbf1c4963af95a0"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
AttachPriceTableToAccountAction.Result res = action.call()
```

7.2.12 DetachPriceTableFromAccount

API Request

URLs

```
DELETE zstack/v1/billings/price-tables/{tableUuid}/accounts/{accountUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/billings/
price-tables/c27d5d1d46ce3b548ec0755d0b354084/
accounts/5b81c2a13b2f319ea97a4568575b0266
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
accountUuid	String	url	The account UUID.		3.7.2
tableUuid	String	url	The table price UUID.		3.7.2
tagUuids	List	body	Optional. The tag UUID list.		3.7.2
systemTags	List	body	Optional. The system tags.		3.7.2
userTags	List	body	Optional. The user tags.		3.7.2

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "34cefcfb3c8e3b97ae94d71558361b25"
  }
}
```

}

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.7.2
inventory	PriceTableInventory	See inventory .	3.7.2

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.7.2
description	String	The brief description of the error.	3.7.2
details	String	The details about the error.	3.7.2
elaboration	String	The reserved field. Default value: null.	3.7.2
opaque	LinkedHashMap	The reserved field. Default value: null.	3.7.2
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.7.2

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.7.2

Name	Type	Description	Starting Version
name	String	The name of the price table.	3.7.2
description	String	The detailed description of the price table.	3.7.2
createDate	Timestamp	The creation date.	3.7.2
lastOpDate	Timestamp	The last operation date.	3.7.2

SDK Sample

Java SDK

```
DetachPriceTableFromAccountAction action = new DetachPriceTableFromAccountAction();
action.accountUuid = "5b81c2a13b2f319ea97a4568575b0266";
action.tableUuid = "c27d5d1d46ce3b548ec0755d0b354084";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DetachPriceTableFromAccountAction.Result res = action.call();
```

Python SDK

```
DetachPriceTableFromAccountAction action = DetachPriceTableFromAccountAction()
action.accountUuid = "5b81c2a13b2f319ea97a4568575b0266"
action.tableUuid = "c27d5d1d46ce3b548ec0755d0b354084"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DetachPriceTableFromAccountAction.Result res = action.call()
```

7.2.13 ChangeAccountPriceTableBinding

API Request

URLs

```
PUT zstack/v1/billings/price-tables/{tableUuid}/accounts/{accountUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeAccountPriceTableBinding": {},
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"changeAccountPriceTableBinding":
{}}' http://localhost:8080/zstack/v1/billings/
price-tables/ca0f8310310e351f8590e4d9f03106bc/
accounts/082289755ebe363daa52eb2aa10cbb01
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
accountUuid	String	url	The account UUID.		3.7.2
tableUuid	String	url	The price table UUID.		3.7.2
resourceUuid	String	body (contained in the changeAccountPriceTableBinding structure)	Optional.		3.7.2
tagUuids	List	body (contained in the changeAccountPriceTableBinding structure)	Optional. The tag UUID list.		3.7.2
systemTags	List	body	Optional. The system tags.		3.7.2
userTags	List	body	Optional. The user tags.		3.7.2

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "5e642eb0820b312086f0b084d656c0cf"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.7.2
inventory	PriceTableInventory	See inventory .	3.7.2

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.7.2
description	String	The brief description of the error.	3.7.2
details	String	The details about the error.	3.7.2
elaboration	String	The reserved field. Default value: null.	3.7.2
opaque	LinkedHashMap	The reserved field. Default value: null.	3.7.2
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.7.2

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.7.2
name	String	The name of the price table.	3.7.2
description	String	The detailed description of the price table.	3.7.2
createDate	Timestamp	The creation date.	3.7.2
lastOpDate	Timestamp	The last operation date.	3.7.2

SDK Sample

Java SDK

```
ChangeAccountPriceTableBindingAction action = new ChangeAccountPriceTableBindingAction();
action.accountUuid = "082289755ebe363daa52eb2aa10cbb01";
action.tableUuid = "ca0f8310310e351f8590e4d9f03106bc";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
ChangeAccountPriceTableBindingAction.Result res = action.call();
```

Python SDK

```
ChangeAccountPriceTableBindingAction action = ChangeAccountPriceTableBindingAction()
action.accountUuid = "082289755ebe363daa52eb2aa10cbb01"
action.tableUuid = "ca0f8310310e351f8590e4d9f03106bc"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
ChangeAccountPriceTableBindingAction.Result res = action.call()
```

7.2.14 GetAccountPriceTableRef**API Request**

URLs

```
GET zstack/v1/billings/price-tables/refs
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X GET http://localhost:8080/zstack/v1/billings/price-tables/refs?
tableUuid=691136f22ea733b8ae6e90dfe42bf38c
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
tableUuid	String	query	Optional. The price table UUID.		3.7.2
accountUuid	String	query	Optional. The account UUID.		3.7.2
systemTags	List	query	Optional. The system tags.		3.7.2
userTags	List	query	Optional. The user tags.		3.7.2

API Response

Sample Response

```
{
  "accountUuids": [
    "67fcb4c5fa0c36adba411d7258d4557e",
    "7a9c5437f5393002a8c8c44bd218e41a",
    "b11fc0267dbf3c5486accb86c79aca01"
  ]
}
```

Name	Type	Description	Starting Version
accountUuids	List	The account UUID list.	3.7.2
tableUuid	String	The price table UUID.	3.7.2
success	boolean		3.7.2
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.7.2
error	ErrorCode	See error .	3.7.2

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	3.7.2
description	String	The brief description of the error.	3.7.2
details	String	The details about the error.	3.7.2
elaboration	String	The reserved field. Default value: null.	3.7.2
opaque	LinkedHashMap	The reserved field. Default value: null.	3.7.2
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.7.2

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	3.7.2
description	String	The brief description of the error.	3.7.2
details	String	The details about the error.	3.7.2
elaboration	String	The reserved field. Default value: null.	3.7.2

Name	Type	Description	Starting Version
opaque	LinkedHashMap	The reserved field. Default value: null.	3.7.2
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.7.2

SDK Sample

Java SDK

```
GetAccountPriceTableRefAction action = new GetAccountPriceTableRefAction();
action.tableUuid = "691136f22ea733b8ae6e90dfe42bf38c";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetAccountPriceTableRefAction.Result res = action.call();
```

Python SDK

```
GetAccountPriceTableRefAction action = GetAccountPriceTableRefAction()
action.tableUuid = "691136f22ea733b8ae6e90dfe42bf38c"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetAccountPriceTableRefAction.Result res = action.call()
```

7.2.15 QueryAccountPriceTableRef

API Request

URLs

```
GET zstack/v1/accounts/price-tables/refs
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```

```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryAccountPriceTableRef**, and pressing the Tab key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "accountUuid": "3dd9565ef61137c2a8615c26da6ddd4c",
      "tableUuid": "b0c83f78e0323aea8969e5b879ffbe5f",
      "createDate": "Nov 14, 2017 10:20:57 PM",
      "lastOpDate": "Nov 14, 2017 10:20:57 PM"
    }
  ]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.7.2
inventories	List	See inventories .	3.7.2

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.7.2
description	String	The brief description of the error.	3.7.2
details	String	The details about the error.	3.7.2
elaboration	String	The reserved field. Default value: null.	3.7.2
opaque	LinkedHashMap	The reserved field. Default value: null.	3.7.2

Name	Type	Description	Starting Version
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.7.2

#inventories

Name	Type	Description	Starting Version
accountUuid	String	The account UUID.	3.7.2
tableUuid	String	The price table UUID.	3.7.2
createDate	Timestamp	The creation date.	3.7.2
lastOpDate	Timestamp	The last operation date.	3.7.2

SDK Sample

SDK Sample

Java SDK

```
QueryAccountPriceTableRefAction action = new QueryAccountPriceTableRefAction();
action.conditions = asList("uuid=36ee3e78b96a32179ffeeffc28f4c6cf0");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryAccountPriceTableRefAction.Result res = action.call();
```

Python SDK

```
QueryAccountPriceTableRefAction action = QueryAccountPriceTableRefAction()
action.conditions = ["uuid=c5a7e0e081583016a4a316245ff6d525"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
QueryAccountPriceTableRefAction.Result res = action.call()
```

7.2.16 GenerateAccountBilling

API Request

URLs

```
PUT zstack/v1/billings/accounts/{accountUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "generateAccountBilling": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"generateAccountBilling":{}}'
http://localhost:8080/zstack/v1/billings/
accounts/54caddf06e1e3b7c995df5e99d8ca9d9/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
accountUuid	String	url	The account UUID.		3.7.2
systemTags	List	body	Optional. The system tags.		3.7.2
userTags	List	body	Optional. The user tags.		3.7.2

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
GenerateAccountBillingAction action = new GenerateAccountBillingAction
();
action.accountUuid = "54caddf06e1e3b7c995df5e99d8ca9d9";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GenerateAccountBillingAction.Result res = action.call();
```

Python SDK

```
GenerateAccountBillingAction action = GenerateAccountBillingAction()
action.accountUuid = "54caddf06e1e3b7c995df5e99d8ca9d9"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GenerateAccountBillingAction.Result res = action.call()
```

7.3 Access Control

7.3.1 Console Service Operations

7.3.1.1 RequestConsoleAccess

API Request

URLs

```
POST zstack/v1/consoles
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "vmInstanceUuid": "b95acae48c804003ac3820751b58a50d"
  },
}
```

```
"systemTags": [],
"userTags": []
}
```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"vmInstanceUuid": "e0442db541833083bd7e411a4d94d969"}}' \
http://localhost:8080/zstack/v1/consols
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vmInstanceUuid	String	body (contained in the params structure)	The VM instance UUID		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response**Sample Response**

```
{
  "inventory": {
    "scheme": "http",
    "hostname": "127.0.0.1",
    "port": 4900.0,
    "token": "d96caf24fae54c76b7652f548a258261"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For	0.6

Name	Type	Description	Starting Version
		more information, see error .	
inventory	ConsoleInventory	See inventory .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventory

Name	Type	Description	Starting Version
scheme	String	The type of the access protocol.	0.6
hostname	String	The hostname.	0.6
port	int	The port.	0.6
token	String	The token.	0.6

SDK Sample

Java SDK

```
RequestConsoleAccessAction action = new RequestConsoleAccessAction();
action.vmInstanceUuid = "c8925478e1f840caa1f3919affa19155";
action.sessionId = "f896abb919754292aa8d2f286596142c";
RequestConsoleAccessAction.Result res = action.call();
```

Python SDK

```
RequestConsoleAccessAction action = RequestConsoleAccessAction()
action.vmInstanceUuid = "f37c825f87444941bf16261f63c7dbb7"
action.sessionId = "331a21749df940e4b447e9103518890d"
RequestConsoleAccessAction.Result res = action.call()
```

7.3.1.2 QueryConsoleProxyAgent

API Request

URLs

```
GET zstack/v1/consoles/agents
GET zstack/v1/consoles/agents/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 350b72c2d3f24641a767acbcec744b19" \
-X GET http://localhost:8080/zstack/v1/consoles/agents?
q=uuid=745b7c17cd224025b3adfef4ae61b3d2
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth bb08e240616b482984c397e4517a021c" \
-X GET http://localhost:8080/zstack/v1/consoles/
agents/8a3cc2be7e20420db29925e381c598bc
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryConsoleProxyAgent**, and pressing the Tab key.

API Response

Sample Response

```
{
  "inventories": [
    {
```

```

    "uuid": "c77bbc7d3364449e9543d0776a6087de",

SDK Sample

Java SDK

```
CreateAccessKeyAction action = new CreateAccessKeyAction();
action.accountUuid = "db517023502d34ef9309e49674af88d0";
action.userUuid = "019f0d7b414b31d98a8de6cab4a8b999";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateAccessKeyAction.Result res = action.call();
```

Python SDK

```
CreateAccessKeyAction action = CreateAccessKeyAction()
action.accountUuid = "db517023502d34ef9309e49674af88d0"
action.userUuid = "019f0d7b414b31d98a8de6cab4a8b999"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
CreateAccessKeyAction.Result res = action.call()
```

7.3.2.2 DeleteAccessKey

API Request

URLs

```
DELETE zstack/v1/accesskeys/{uuid}?deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/
accesskeys/7fcbb0096e3d3e2a8dd4f83610d3dac9?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The AccessKey UUID.		3.2.0
deleteMode	String	url	Optional. The delete mode.		3.2.0
systemTags	List	body	Optional. The system tags.		3.2.0
userTags	List	body	Optional. The user tags.		3.2.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DeleteAccessKeyAction action = new DeleteAccessKeyAction();
action.uuid = "7fcbb0096e3d3e2a8dd4f83610d3dac9";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteAccessKeyAction.Result res = action.call();
```

Python SDK

```
DeleteAccessKeyAction action = DeleteAccessKeyAction()
action.uuid = "7fcbb0096e3d3e2a8dd4f83610d3dac9"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteAccessKeyAction.Result res = action.call()
```

7.3.2.3 QueryAccessKey

API Request

URLs

```
GET zstack/v1/accesskeys
GET zstack/v1/accesskeys/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/accesskeys?
q=uuid=fc008e53779632989bf9393ecf074e25
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/accesskeys/
f99c1aea4a6e35e4a88c6abfe11cce8d
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryAccessKey**, and pressing the Tab key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "uuid": "12be3dd32afa3cf2afa4c06037f218b7",
      "accountUuid": "324ecf74dd5c3b9a9f2b75edfdbd858f",
      "userUuid": "49c0bc4cfa6d3a67930fe4a4cc32248c",
      "AccessKeyID": "1234567890abcdedfhij",
      "AccessKeySecret": "1234567890abcdedfhij1234567890abcdedfhij",
      "state": "Enabled"
    }
  ]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.2.0
inventories	List	See inventories .	3.2.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.2.0
description	String	The brief description of the error.	3.2.0
details	String	The details about the error.	3.2.0
elaboration	String	The reserved field. Default value: null.	3.2.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.2.0
cause	ErrorCode	The root error, which is the associated root	3.2.0

Name	Type	Description	Starting Version
		cause of the current error. If no root error exists, this parameter is null.	

#inventories

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.2.0
description	String	The detailed description of the resource.	3.2.0
accountUuid	String	The account UUID.	3.2.0
userUuid	String	The user UUID.	3.2.0
AccessKeyID	String		3.2.0
AccessKeySecret	String		3.2.0

lastOpDate	Timestamp	The last operation date.	3.2.0
state	AccessKeyState	See state .	3.2.0

#state

Name	Type	Description	Starting Version
name	String	The resource name.	3.2.0
ordinal	int		3.2.0

SDK Sample

Java SDK

```
QueryAccessKeyAction action = new QueryAccessKeyAction();
action.conditions = asList("uuid=f0c530f17978349faa8c4736accd0375");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryAccessKeyAction.Result res = action.call();
```

Python SDK

```
QueryAccessKeyAction action = QueryAccessKeyAction()
action.conditions = ["uuid=ee3c98b8528e3fe2aa9d817cd48b1358"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
QueryAccessKeyAction.Result res = action.call()
```

7.3.2.4 ChangeAccessKeyState

API Request

URLs

```
PUT zstack/v1/accesskeys/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeAccessKeyState": {
    "stateEvent": "disable"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"changeAccessKeyState":{"stateEvent":"disable"}}' http://
localhost:8080/zstack/v1/accesskeys/2c9c06fee2513d4b81f1af281ab6bb7b/
actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The AccessKey UUID.		3.2.0
stateEvent	String	body (contained in the changeAcce	Enables or disables the AccessKey.	- enable - disable	3.2.0

Name	Type	Location	Description	Optional Value	Starting Version
		ssKeyState structure)			
systemTags	List	body	Optional. The system tags.		3.2.0
userTags	List	body	Optional. The user tags.		3.2.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "defe79b1a43f35818dc6d3959b571773",
    "accountUuid": "d0c06c8d19f439b1b8f481dbdf3e3a3c",

state	AccessKeyState	See state .	3.2.0

#state

Name	Type	Description	Starting Version
name	String	The resource name.	3.2.0
ordinal	int		3.2.0

SDK Sample

Java SDK

```
ChangeAccessKeyStateAction action = new ChangeAccessKeyStateAction();
action.uuid = "2c9c06fee2513d4b81f1af281ab6bb7b";
action.stateEvent = "disable";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
ChangeAccessKeyStateAction.Result res = action.call();
```

Python SDK

```
ChangeAccessKeyStateAction action = ChangeAccessKeyStateAction()
action.uuid = "2c9c06fee2513d4b81f1af281ab6bb7b"
action.stateEvent = "disable"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
ChangeAccessKeyStateAction.Result res = action.call()
```

7.3.3 IP Blacklist/Whitelist Operations

7.3.3.1 AddAccessControlRule

API Request

URLs

```
POST zstack/v1/login-control/access-control/rules
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "rule1",
    "description": "this is a rule",
    "rule": "172.20.1.1,172.20.1.2",
    "controlStrategy": "ACCEPT"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"name":"rule1","description":"this is a
rule","rule":"172.20.1.1,172.20.1.2","controlStrategy":"ACCEPT"}}'
http://localhost:8080/zstack/v1/login-control/access-control/rules
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The resource UUID.		3.5.1
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		3.5.1
rule	String	body (contained in the params structure)			3.5.1
controlStrategy	String	body (contained in the params structure)			3.5.1
resourceUuid	String	body (contained in the params structure)	Optional.		3.5.1
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID list.		3.5.1
systemTags	List	body	Optional. The system tags.		3.5.1
userTags	List	body	Optional. The user tags.		3.5.1

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
AddAccessControlRuleAction action = new AddAccessControlRuleAction();
action.name = "rule1";
action.description = "this is a rule";
action.rule = "172.20.1.1,172.20.1.2";
action.controlStrategy = "ACCEPT";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
AddAccessControlRuleAction.Result res = action.call();
```

Python SDK

```
AddAccessControlRuleAction action = AddAccessControlRuleAction()
action.name = "rule1"
action.description = "this is a rule"
action.rule = "172.20.1.1,172.20.1.2"
action.controlStrategy = "ACCEPT"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
AddAccessControlRuleAction.Result res = action.call()
```

7.3.3.2 DeleteAccessControlRule

API Request

URLs

```
DELETE zstack/v1/login-control/access-control/rules/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X DELETE http://localhost:8080/zstack/v1/login-control/access-control/rules/04baa07ba917360394ec649e26b93593?
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.5.1
deleteMode	String	body	Optional. The delete mode.		3.5.1
systemTags	List	body	Optional. The system tags.		3.5.1
userTags	List	body	Optional. The user tags.		3.5.1

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteAccessControlRuleAction action = new DeleteAccessControlRuleAction();
action.uuid = "04baa07ba917360394ec649e26b93593";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteAccessControlRuleAction.Result res = action.call();
```

Python SDK

```
DeleteAccessControlRuleAction action = DeleteAccessControlRuleAction()
action.uuid = "04baa07ba917360394ec649e26b93593"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
DeleteAccessControlRuleAction.Result res = action.call()
```

7.3.3.3 UpdateAccessControlRule

API Request

URLs

```
PUT zstack/v1/login-control/access-control/rules/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateAccessControlRule": {
    "name": "rule1",
    "description": "this is a rule"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateAccessControlRule":
{"name":"rule1","description":"this is a rule"}}' http://
localhost:8080/zstack/v1/login-control/access-control/
rules/6bc3181222854438ac8af53f2b57ecf7/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.5.1
name	String	body (contained in the updateAcce	Optional. The resource name.		3.5.1

Name	Type	Location	Description	Optional Value	Starting Version
		ssControlRule structure)			
description	String	body (contained in the updateAccessControlRule structure)	Optional. The detailed description of the resource.		3.5.1
systemTags	List	body	Optional. The system tags.		3.5.1
userTags	List	body	Optional. The user tags.		3.5.1

API Response

Sample Response

```
{
  "inventory": {
    "name": "rule",
    "description": "this is rule description",
    "rule": "172.20.1.1",
    "strategy": "ACCEPT",
    "createDate": "Nov 14, 2017 10:20:57 PM",
    "lastOpDate": "Nov 14, 2017 10:20:57 PM"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.5.1
inventory	AccessControlRuleInventory	See inventory .	3.5.1

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.5.1

elaboration	String	The reserved field. Default value: null.	3.5.1
opaque	LinkedHashMap	The reserved field. Default value: null.	3.5.1
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.5.1

SDK Sample

Java SDK

```
GetLoginCaptchaAction action = new GetLoginCaptchaAction();
action.resourceName = "admin";
action.loginType = "Test";
GetLoginCaptchaAction.Result res = action.call();
```

Python SDK

```
GetLoginCaptchaAction action = GetLoginCaptchaAction()
action.resourceName = "admin"
action.loginType = "Test"
GetLoginCaptchaAction.Result res = action.call()
```

8 Settings

8.1 Log Server Operations

8.1.1 AddLogServer

API Request

URLs

```
POST zstack/v1/log/servers
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "log-server",
    "description": "log server",
    "category": "ManagementNodeLog",
    "type": "Log4j2",
    "level": "ALL",
    "configuration": "{\n\"appenderType\": \"Syslog\", \n\"configuration\": {\n\"hostname\": \"192.168.0.11\", \n\"port\": \"514\", \n\"protocol\": \"UDP\", \n\"facility\": \"LOCAL5\" \n} \n}"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"name":"log-server","description":"log server","category":"ManagementNodeLog","type":"Log4j2","level":"ALL","configuration":{"appenderType": "Syslog", "configuration": {"hostname": "192.168.0.11", "port": "514", "protocol": "UDP", "facility": "LOCAL5" }}}}' \
http://localhost:8080/zstack/v1/log/servers
```

Request Parameters

Name	Type	Location	Description	Valid Values	Starting Version
name	String	body (container in the params structure)	The resource name.		5.3.28
description	String	body (container in the params structure)	Optional. The resource description.		5.3.28
category	String	body (container in the params structure)	The log category.	• ManagementNodeLog • PlatformOperationLog	5.3.28
type	String	body (container in the params structure)	The log type.	• Log4j2 • FluentBit	5.3.28
level (可选)	String	body (container in the params structure)	Optional. The log severity level.	• OFF • FATAL • ERROR • WARN • INFO • DEBUG • TRACE • ALL	5.3.28
configuration	String	body (container in the params structure)	The log configurations.		5.3.28
resourceUuid	String	body (container in the params structure)	Optional. The resource UUID.		5.3.28
tagUuids	List	body (container in the params structure)	Optional. The tag UUID list.		5.3.28

Name	Type	Location	Description	Valid Values	Starting Version
systemTags	List	body	Optional. The system tags.		5.3.28
userTags	List	body	Optional. The user tags.		5.3.28

API Response

Sample Response

```
{
  "inventory": {}
}
```

Name	Type	Description	Starting Version
success	boolean		5.3.28
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error	5.3.28
inventory	LogServerInventory	See inventory	5.3.28

#error

名字	类型	描述	起始版本
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	5.3.28
description	String	The brief description of the error.	5.3.28
details	String	The details about the error.	5.3.28
elaboration	String	The reserved field. Default value: null.	5.3.28

名字	类型	描述	起始版本
opaque	LinkedHashMap	The reserved field. Default value: null.	5.3.28
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	5.3.28

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	5.3.28
name	String	The resource name.	5.3.28
description	String	The resource description.	5.3.28
configuration	String		5.3.28
createDate	Timestamp	The creation time.	5.3.28
lastOpDate	Timestamp	The last operation time	5.3.28
category	LogCategory	See category	5.3.28
type	LogType	See type	5.3.28
level	LogLevel	See level	5.3.28

#category

Name	Type	Description	Starting Version
ManagementNodeLog	LogCategory		5.3.28
PlatformOperationLog	LogCategory		5.3.28

#type

Name	Type	Description	Starting Version
Log4j2	LogType		5.3.28
FluentBit	LogType		5.3.28

#level

Name	Type	Description	Starting Version
OFF	LogLevel		5.3.28
FATAL	LogLevel		5.3.28
ERROR	LogLevel		5.3.28
WARN	LogLevel		5.3.28
INFO	LogLevel		5.3.28
DEBUG	LogLevel		5.3.28
TRACE	LogLevel		5.3.28
ALL	LogLevel		5.3.28

SDK示例

Java SDK

```
AddLogServerAction action = new AddLogServerAction();
action.name = "log-server";
action.description = "log server";
action.category = "ManagementNodeLog";
action.type = "Log4j2";
action.level = "ALL";
action.configuration = "{
  \"appenderType\": \"Syslog\",
  \"configuration\": {
    \"hostname\": \"192.168.0.11\",
    \"port\": \"514\",
    \"protocol\": \"UDP\",
    \"facility\": \"LOCAL5\"
  }
}";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
AddLogServerAction.Result res = action.call();
```

Python SDK

```
AddLogServerAction action = AddLogServerAction()
action.name = "log-server"
action.description = "log server"
action.category = "ManagementNodeLog"
action.type = "Log4j2"
action.level = "ALL"
action.configuration = "{
  \"appenderType\": \"Syslog\",
  \"configuration\": {
    \"hostname\": \"192.168.0.11\",
    \"port\": \"514\",
    \"protocol\": \"UDP\",
    \"facility\": \"LOCAL5\"
  }
}
```

```
}
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
AddLogServerAction.Result res = action.call()
```

8.1.2 DeleteLogSever

API Request

URLs

```
DELETE zstack/v1/log/servers
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/log/servers
```

Request Parameters

Name	Type	Location	Description	Valid Values	Starting Version
uuid	String	body	The resource UUID.		5.3.28
systemTags	List	body	Optional. The system tags.		5.3.28
userTags	List	body	Optional. The user tags.		5.3.28

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DeleteLogServerAction action = new DeleteLogServerAction();
action.uuid = "cdc213d6ba25367ea6c4d201491d900c";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteLogServerAction.Result res = action.call();
```

Python SDK

```
DeleteLogServerAction action = DeleteLogServerAction()
action.uuid = "cdc213d6ba25367ea6c4d201491d900c"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteLogServerAction.Result res = action.call()
```

8.1.3 QueryLogServer

API Request

URLs

```
GET zstack/v1/log/servers
```

```
GET zstack/v1/log/servers/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/log/servers?
q=uuid=xxx&q=name=xxx
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/log/
servers/9699713cfb583c70b749adca2c01a77b
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryLdapServer**, and pressing the Tab key.

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
QueryLogServerAction action = new QueryLogServerAction();
action.conditions = asList("uuid=xxx","name=xxx");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryLogServerAction.Result res = action.call();
```

Python SDK

```
QueryLogServerAction action = QueryLogServerAction()
action.conditions = ["uuid=xxx","name=xxx"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryLogServerAction.Result res = action.call()
```

8.1.4 UpdateLogServer

API Request

URLs

```
PUT zstack/v1/log/servers
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateLogServer": {
    "uuid": "10bf3f837edf37a0be99a84d1edafb6b",
    "name": "example"
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateLogServer":
{"uuid":"10bf3f837edf37a0be99a84d1edafb6b","name":"example"}}' \
http://localhost:8080/zstack/v1/log/servers
```

Request Parameters

Name	Type	Location	Description	Valid Values	Starting Version
uuid	String	body (container in the updateLogServer structure)	The resource UUID.		5.3.28
name	String	body (container in the updateLogServer structure)	Optional. The resource name.		5.3.28
description	String	body (container in the updateLogServer structure)	Optional. The resource description.		5.3.28
systemTags	List	body	Optional. The system tags.		5.3.28
userTags	List	body	Optional. The user tags.		5.3.28

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
UpdateLogServerAction action = new UpdateLogServerAction();
action.uuid = "10bf3f837edf37a0be99a84d1edafb6b";
action.name = "example";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateLogServerAction.Result res = action.call();
```

Python SDK

```
UpdateLogServerAction action = UpdateLogServerAction()
action.uuid = "10bf3f837edf37a0be99a84d1edafb6b"
action.name = "example"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateLogServerAction.Result res = action.call()
```

8.2 Observability Server Operations

8.2.1 CreateObservabilityServer

API Request

URLs

```
POST zstack/v1/observability-servers
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "obs-1",
    "observabilityServerOfferingUuid": "83475c2834f83dd59ccf8741787d800e",
    "description": "desc",
```

```

    "zoneUuid": "0f33fd3eee6a3b61abce2de06cb1dc24",
    "clusterUuid": "8a47ef8b40e33be8880d24f496cceaf6",
    "hostUuid": "b009ff2ecfe334e5b9dae2501af8c612",
    "primaryStorageUuidForRootVolume": "137d4d95aded3f09a133fb9fd61973
49"
  },
  "systemTags": [],
  "userTags": []
}

```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json; charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edebf53ca0678c" \
-X POST -d '{"params":
{"name": "obs-1", "observabilityServerOfferingUuid": "83475c2834f83dd59ccf8741787d80
\
http://localhost:8080/zstack/v1/observability-servers

```

Request Parameters

8.2.2 AttachServiceToObservabilityServer

API Request

URLs

```
POST zstack/v1/observability-server/{observabilityServerUuid}/service
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "serviceType": "loadBalancer",
    "serviceUuid": "50b12612d2b4318193c2e040d98e8f7b"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":

action.endTime = "2024-12-01 18:00:00";
action.sortDirection = "asc";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetObservabilityServerServiceDataAction.Result res = action.call();
```

Python SDK

```
GetObservabilityServerServiceDataAction action = GetObservabilityServerServiceDataAction()
action.observabilityServerUuid = "f1718b20d8cd3daba51e1b39dcf35299"
action.serviceType = "loadBalancer"
action.serviceUuid = "11836e85c4d7391a8d8c54248fd89815"
action.limit = 10
action.startTime = "2024-12-01 17:00:00"
action.endTime = "2024-12-01 18:00:00"
action.sortDirection = "asc"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
GetObservabilityServerServiceDataAction.Result res = action.call()
```

8.3 AD/LDAP/OAuth Operations

8.3.1 AddLdapServer

API Request

URLs

```
POST zstack/v1/ldap/servers
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "miao",
    "description": "miao desc",
    "url": "ldap://localhost:1888",
    "base": "dc\u003dexample,dc\u003dcom",
    "username": "",
    "password": "",
    "encryption": "None"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"name":"miao","description":"miao desc","url":"ldap://localhost:1888","base":"dc=example,dc=com","username":"","password":"","encryption": ""},"systemTags": [], "userTags": []}' \
http://localhost:8080/zstack/v1/ldap/servers
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The resource name.		0.6
description	String	body (contained in the params structure)	The detailed description of the resource.		0.6
url	String	body (contained in the params structure)	The URL of the LDAP server.		0.6
base	String	body (contained in the params structure)	The base DN of the LDAP server.		0.6
username	String	body (contained in the params structure)	The username used to access the LDAP server.		0.6
password	String	body (contained in the params structure)	The password.		0.6
encryption	String	body (contained in the params structure)	The encryption method.	• None • TLS	0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

**Note:**

- When you add an AD/LDAP server in ZStack Cloud, you can synchronize users by adding the **virtualIDSyncConfiguration** option to **SystemTags**.
 - Format of the **virtualIDSyncConfiguration** option: `virtualIDSyncConfiguration::{"rules":[{"name":"name","attribute":"cn","type":"SYSTEM","optional":"true"}, {"name":"fullname","attribute":"cn","type":"CUSTOM","optional":"true"}]}`
 - Example: `virtualIDSyncConfiguration::{"rules":[{"name":"name","attribute":"cn","type":"SYSTEM","optional":"true"}, {"name":"fullname","attribute":"cn","type":"CUSTOM","optional":"true"}]}`
- When you add an AD/LDAP server in ZStack Cloud, you can synchronize organizations by adding the **organizationSyncConfiguration** option to **SystemTags**.
 - Format of the **organizationSyncConfiguration** option: `organizationSyncConfiguration::{"rules":[{"name":"name","attribute":"distinguishedName","type":"SYSTEM","optional":"true"}, {"name":"description","attribute":"description","type":"SYSTEM","optional":"true"}], "strategy":"Group"}`
 - Example: `organizationSyncConfiguration::{"rules":[{"name":"name","attribute":"distinguishedName","type":"SYSTEM","optional":"true"}, {"name":"description","attribute":"description","type":"SYSTEM","optional":"true"}], "strategy":"Group"}`

**Note:**

- When you add AD/LDAP, the system will automatically check whether the server, port, base DN, login attribute, user DN, and password are correct. The waiting time does not exceed 5 seconds.

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "ef7291bd94ce478880938851e3ff6ad6",
    "name": "miao",
    "description": "miao desc",
    "url": "ldap://localhost:1888",

```

```

"base": "dc\u003dexample,dc\u003dcom",
"username": "",
"password": "",
"encryption": "None"
}
}

```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventory	LdapServerInventory	See inventory .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
name	String	The resource name.	0.6
description	String	The detailed description of the resource.	0.6
url	String		0.6
base	String	The base DN of the LDAP server.	0.6
username	String	The username used to access the LDAP server.	0.6
password	String	The password.	0.6
encryption	String	The encryption method.	0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6

SDK Sample

Java SDK

```
AddLdapServerAction action = new AddLdapServerAction();
action.name = "miao";
action.description = "miao desc";
action.url = "ldap://localhost:1888";
action.base = "dc=example,dc=com";
action.username = "";
action.password = "";
action.encryption = "None";
action.sessionId = "c805609607b94f1688e4f5791089ab6f";
AddLdapServerAction.Result res = action.call();
```

Python SDK

```
AddLdapServerAction action = AddLdapServerAction()
action.name = "miao"
action.description = "miao desc"
action.url = "ldap://localhost:1888"
action.base = "dc=example,dc=com"
action.username = ""
action.password = ""
action.encryption = "None"
action.sessionId = "611a70f771874450945f77465bca7642"
```

```
AddLdapServerAction.Result res = action.call()
```

8.3.2 DeleteLdapServer

API Request

URLs

```
DELETE/v1/ldap/servers/{uuid}?deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth a90abb1116c0428097769adfdc9ae867" \
-X DELETE http://localhost:8080/zstack/v1/ldap/
servers/93d7c467c493464fa3d244163c94f64e?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
deleteMode	String	body	Optional. The delete mode.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DeleteLdapServerAction action = new DeleteLdapServerAction();
action.uuid = "0e757aebf26346c19ee1f163ea9f0915";
action.deleteMode = "Permissive";
action.sessionId = "3dae39cdbba749ba91deda6b854695ec";
DeleteLdapServerAction.Result res = action.call();
```

Python SDK

```
DeleteLdapServerAction action = DeleteLdapServerAction()
action.uuid = "7755f302acd44c62833f9d4eb3f7327c"
action.deleteMode = "Permissive"
action.sessionId = "61e33f5ab13b44ef873ef7fc719d3804"
DeleteLdapServerAction.Result res = action.call()
```

8.3.3 QueryLdapServer

API Request

URLs

```
GET zstack/v1/ldap/servers
GET zstack/v1/ldap/servers/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 940b9dba281d40b897497a95e8a0e942" \
-X GET http://localhost:8080/zstack/v1/ldap/servers?q=name=ldap server
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth e4e74e66dc074b24b7071b43b12240a2" \
-X GET http://localhost:8080/zstack/v1/ldap/servers/
c898d74cdcb94ac4b3b28ac6b7a8f7f5
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryLdapServer**, and pressing the Tab key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "uuid": "91820f68407a441c9ba031ac15fa322d",
      "name": "miao",
      "description": "miao desc",
      "url": "ldap://localhost:1888",
      "base": "dc\u003dexample,dc\u003dcom",
      "username": "",
      "password": "",
      "encryption": "None"
    }
  ]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventories	List	See inventories .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6

lastOpDate	Timestamp	The last operation date.	0.6

SDK Sample

Java SDK

```
QueryLdapServerAction action = new QueryLdapServerAction();
action.conditions = asList("name=ldap server");
action.sessionId = "a8d28261d5b940c9bdd4712a511bd537";
QueryLdapServerAction.Result res = action.call();
```

Python SDK

```
QueryLdapServerAction action = QueryLdapServerAction()
action.conditions = ["name=ldap server"]
```

```
action.sessionId = "aee6bc43a2fb4f1eb6c35e3a064dd464"
QueryLdapServerAction.Result res = action.call()
```

8.3.4 UpdateLdapServer

API Request

URLs

```
PUT zstack/v1/ldap/servers/{ldapServerUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateLdapServer": {
    "name": "new name"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth e0360b3fd1d04df0b98005ab41f233ea" \
-X PUT -d '{"updateLdapServer":{"name":"new name"}}' \
http://localhost:8080/zstack/v1/ldap/
servers/6c2af8cab16b3310a3d31aa772b093ba
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
ldapServerUuid	String	url	The LDAP server UUID.		0.6
name	String	body (contained in the updateLdap	Optional. The resource name.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
		Server structure)			
description	String	body (contained in the updateLdap Server structure)	Optional. The detailed description of the resource.		0.6
url	String	body (contained in the updateLdap Server structure)	Optional. The URL of the LDAP server.		0.6
base	String	body (contained in the updateLdap Server structure)	Optional. The base DN of the LDAP server.		0.6
username	String	body (contained in the updateLdap Server structure)	Optional. The username used to access the LDAP server.		0.6
password	String	body (contained in the updateLdap Server structure)	Optional. The password.		0.6
encryption	String	body (contained in the updateLdap Server structure)	Optional. The encryption method.	• None • TLS	0.6

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "8e1ee5b25564449fbd6054621567b5c1",
    "name": "new name",
    "description": "miao desc",
    "url": "ldap://localhost:1888",
    "base": "dc\u003dexample,dc\u003dcom",
    "username": "",
    "password": "",
    "encryption": "None"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventory	LdapServerInventory	See inventory .	0.6

lastOpDate	Timestamp	The last operation date.	0.6

SDK Sample

Java SDK

```
UpdateLdapServerAction action = new UpdateLdapServerAction();
action.ldapServerUuid = "37fbaf59c5d74dd7b61c2af4e74c28cf";
action.name = "new name";
action.sessionId = "f968929105af41ef8a6a2c602f315c91";
UpdateLdapServerAction.Result res = action.call();
```

Python SDK

```
UpdateLdapServerAction action = UpdateLdapServerAction()
action.ldapServerUuid = "57e7fe86092046228999e8599c6c8bd1"
action.name = "new name"
action.sessionId = "f6ca4878b0164e9eab1d6219777c5af2"
UpdateLdapServerAction.Result res = action.call()
```

8.3.5 CreateLdapBinding

API Request

URLs

```
POST zstack/v1/ldap/bindings
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "ldapUid": "ou\u003dEmployee,uid\u003dtest",
    "accountUuid": "29777229ee1e32d29c6f255b126e29a1"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X POST -d '{"params":
{"ldapUid": "ou=Employee,uid=test", "accountUuid": "29777229ee1e32d29c6f255b126e29a1
http://localhost:8080/zstack/v1/ldap/bindings
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
ldapUid	String	body (contained in the params structure)	The LDAP UID.		4.7.0
accountUuid	String	body (contained in the params structure)	The account UUID.		4.7.0
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "a552eb007adf4070ade72a4b678ecc30",
    "ldapUid": "ou\u003dEmployee,uid\u003dtest",
    "ldapServerUuid": "cd37f226e18c4ef09bb613200e3e90ba",
    "accountUuid": "5ff96c17eb8f476a988991e9410b153f"
  }
}
```

Name	Type	Description	Starting Version
success	boolean		4.7.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventory	LdapAccountRefInventory	See inventory .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
ldapUid	String	The LDAP UID.	0.6
ldapServerUuid	String	The LDAP server UUID.	0.6
accountUuid	String	The account UUID.	0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6

SDK Sample

Java SDK

```
CreateLdapBindingAction action = new CreateLdapBindingAction();
action.ldapUid = "ou=Employee,uid=test";
action.accountUuid = "7bff0855d3da4ab89659d29821d6daee";
action.sessionId = "5fd897a8db504aee91a64a3b02c05ce9";
CreateLdapBindingAction.Result res = action.call();
```

Python SDK

```
CreateLdapBindingAction action = CreateLdapBindingAction()
action.ldapUid = "ou=Employee,uid=test"
action.accountUuid = "db2842e0b16d4aa2af39abee7e80d2f1"
action.sessionId = "9ece25398fe74a91a90cec68b50cd203"
CreateLdapBindingAction.Result res = action.call()
```

8.3.6 DeleteLdapBinding

API Request

URLs

```
DELETE/v1/ldap/bindings/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 50d8d41e03b54adf9d8d88342a9d6efe" \
-X DELETE http://localhost:8080/zstack/v1/ldap/
bindings/9a04287ade54400686e99485c86d9545?
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteLdapBindingAction action = new DeleteLdapBindingAction();
action.uuid = "5f9ff578f8ff4231b2ad18f5aa185076";
action.sessionId = "6690dcc7a9c64c26a17ae9bf29955e0a";
DeleteLdapBindingAction.Result res = action.call();
```

Python SDK

```
DeleteLdapBindingAction action = DeleteLdapBindingAction()
action.uuid = "3e5a338390d046008e2723c475c90a66"
action.sessionId = "2f93ee0fc083464fbe73053354ba470c"
DeleteLdapBindingAction.Result res = action.call()
```

8.3.7 QueryLdapBinding

AP Request

URLs

```
GET zstack/v1/ldap/bindings
GET zstack/v1/ldap/bindings/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth f114b38ccae244c38cda7ec7dbdd062c" \
-X GET http://localhost:8080/zstack/v1/ldap/bindings?
q=accountUuid=f1672bbe810b4b3b89f030f5f51fdb79
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 43f9144da747462eaa08da071d317c45" \
```

```
-X GET http://localhost:8080/zstack/v1/ldap/
bindings/9e959125b2f64a86a2a380b335b2543e
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryLdapBinding`, and pressing the Tab key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "uuid": "7e7c5818d2bc4d45b61fdbed5c1a64b0",
      "ldapUid": "ou\u003dEmployee,uid\u003dtest",
      "ldapServerUuid": "540e7691df7349c58cff8ffcaf305b9b",
      "accountUuid": "0829b88f337b4500b2ba28936fe5ae3d"
    }
  ]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventories	List	See inventories .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
ldapUid	String	The LDAP UID.	0.6
ldapServerUuid	String	The LDAP server UUID.	0.6
accountUuid	String	The account UUID.	0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6

SDK Sample

Java SDK

```
QueryLdapBindingAction action = new QueryLdapBindingAction();
action.conditions = asList("accountUuid=d5915883c1c04b62af8423f04bb1b3f3");
action.sessionId = "2b7a31a70f7d4e90b0159cd0b9396f26";
QueryLdapBindingAction.Result res = action.call();
```

Python SDK

```
QueryLdapBindingAction action = QueryLdapBindingAction()
action.conditions = ["accountUuid=15cdbd6f45bf434492ef22eb2d77b6f4"]
action.sessionId = "4956fb9e5d874e88851634154bda4d4a"
```

```
QueryLdapBindingAction.Result res = action.call()
```

8.3.8 CleanInvalidLdapBinding

API Request

URLs

```
PUT zstack/v1/ldap/bindings/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "cleanInvalidLdapBinding": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth f8ba3bdbb1fe407db3da890e5a47d322" \
-X PUT -d '{"cleanInvalidLdapBinding":{}}' \
http://localhost:8080/zstack/v1/ldap/bindings/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventories": [
```

```
{
  "uuid": "f9e03ca4fe8a3680831df56460533615",
  "name": "admin",
  "type": "Normal",
  "createDate": "Nov 14, 2017 10:20:57 PM",
  "lastOpDate": "Nov 14, 2017 10:20:57 PM"
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventories	List	See inventories .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventories

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
name	String	The resource name.	0.6
description	String	The detailed description of the resource.	0.6
type	String	The account type, including administrator and user.	0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6

SDK Sample

Java SDK

```
CleanInvalidLdapBindingAction action = new CleanInvalidLdapBindingAction();
action.sessionId = "ba374e312f0044669323e3ba55aa44a2";
CleanInvalidLdapBindingAction.Result res = action.call();
```

Python SDK

```
CleanInvalidLdapBindingAction action = CleanInvalidLdapBindingAction()
action.sessionId = "61a940c24a5e4667a03c87dbd968dfd8"
CleanInvalidLdapBindingAction.Result res = action.call()
```

8.3.9 LoginByLdap

API Request

URLs

```
PUT zstack/v1/ldap/login
```

Body

```
{
  "loginByLdap": {
    "uid": "ou\u003dEmployee,uid\u003dtest",
    "password": "password",
    "verifyCode": "test",
    "captchaUuid": "3bb4e611b10e32cfaaa7fb4b1e3515ac"
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-X PUT -d '{"logInByLdap":
{"uid":"ou=Employee,uid=test", "password":"password", "verifyCode":"test", "captcha":
http://localhost:8080/zstack/v1/ldap/login
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uid	String	body (contained in the logInByLdap structure)	The LDAP UID.		0.6
password	String	body (contained in the logInByLdap structure)	The password.		0.6
captchaUuid	String	body (contained in the logInByLdap structure)	Optional. The verification code UUID.		2.6.0
verifyCode	String	body (contained in the logInByLdap structure)	Optional. The verification code.		2.6.0
clientInfo	Map	body (contained in the logInByLdap structure)	Optional. The client information.		3.5.0

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {

cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

SDK Sample

Java SDK

```

LogInByLdapAction action = new LogInByLdapAction();
action.uid = "ou=Employee,uid=test";
action.password = "password";
action.verifyCode = "test";
action.captchaUuid = "3bb4e611b10e32cfaaa7fb4b1e3515ac";

```

```
LogInByLdapAction.Result res = action.call();
```

Python SDK

```
LogInByLdapAction action = LogInByLdapAction()
action.uid = "ou=Employee,uid=test"
action.password = "password"
action.verifyCode = "test"
action.captchaUuid = "3bb4e611b10e32cfaaa7fb4b1e3515ac"
LogInByLdapAction.Result res = action.call()
```

8.3.10 GetLdapEntry

API Request

URLs

```
GET zstack/v1/ldap/entry
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/ldap/entry?
ldapFilter=(cn=user_xxx)&limit=2500.0
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
ldapFilter	String	query	The query condition.		2.2
systemTags	List	query	Optional. The system tags.		2.2
userTags	List	query	Optional. The user tags.		2.2
limit	Integer	query	Optional. The maximum number of returned records. This parameter is similar to the		2.2

Name	Type	Location	Description	Optional Value	Starting Version
			limit field of MySQL.		

API Response

loginMNUrl	String	The password-free login url.	4.5.0
createDate	Timestamp	The creation date.	4.5.0
lastOpDate	Timestamp	The last operation date.	4.5.0
accountUuid	String	The account UUID.	4.5.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.5.0

Name	Type	Description	Starting Version
description	String	The brief description of the error.	4.5.0
details	String	The details about the error.	4.5.0
elaboration	String	The reserved field. Default value: null.	4.5.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.5.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.5.0

SDK Sample

CreateOAuthClientAction.Result res = action.call()

```

8.3.13 DeleteSSOClient

API Request

URLs

```
POST zstack/v1/delete/sso/client
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```

{
  "params": {
    "uuid": "3e54cb2e27ff31dda2c49851bf2662d2",
    "deleteMode": "Permissive"
  },
  "systemTags": [],
  "userTags": []
}

```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl示例

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"uuid":"3e54cb2e27ff31dda2c49851bf2662d2","deleteMode":"Permissive"}}' \
http://localhost:8080/zstack/v1/delete/sso/client

```

参数列表

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	body (contained in the params structure)	The resource UUID.		4.5.0
deleteMode	String	body (contained in the params structure)	Optional. The deletion mode: • Permissive • Enforcing, Permissive		4.5.0
systemTags	List	body	Optional. The system tag.		4.5.0
userTags	List	body	Optional. The user tag.		4.5.0

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteSSOClientAction action = new DeleteSSOClientAction();
action.uuid = "3e54cb2e27ff31dda2c49851bf2662d2";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteSSOClientAction.Result res = action.call();
```

Python SDK

```
DeleteSSOClientAction action = DeleteSSOClientAction()
action.uuid = "3e54cb2e27ff31dda2c49851bf2662d2"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
DeleteSSOClientAction.Result res = action.call()
```

8.3.14 UpdateOAuthClient

API Request

URLs

```
POST zstack/v1/update/oauth2/client
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "test",
    "description": "test",
    "clientId": "9f44e569b86c3883b0295fcab980e945",
    "clientSecret": "8b151acd0f7533538ed9e9315fadcaca",
    "authorizationUrl": "http://zstack.com/code",
    "tokenUrl": "http://zstack.com/token",
    "redirectUrl": "http://zstack.com/redirectUrl",
    "userInfoUrl": "http://zstack.com/userinfoUrl",
    "identityProvider": "zf-soft",
    "pluginUuid": "0b3b9a43772439c3aaa102fe8361b3d1",
    "loginType": "iam1",
    "logoutUrl": "http://zstack.com/logouturl",
    "scopeList": [
      "d8f4a70ef87b35c986336a88dd5bafd1"
    ]
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"name":"test","description":"test","clientId":"9f44e569b86c3883b0295fcab980e945",
"code","tokenUrl":"http://zstack.com/
token","redirectUrl":"http://zstack.com/
redirectUrl","userInfoUrl":"http://zstack.com/
userinfoUrl","identityProvider":"zf-
soft","pluginUuid":"0b3b9a43772439c3aaa102fe8361b3d1","loginType":"iam1","logoutU
```

```
logouturl", "scopeList": ["d8f4a70ef87b35c986336a88dd5bafd1"]]]}' http://localhost:8080/zstack/v1/update/oauth2/client
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	body (contained in the params structure)	The resource UUID.		4.5.0
name	String	body (contained in the params structure)	Optional. The resource name.		4.5.0
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		4.5.0
clientId	String	body (contained in the params structure)	Optional. The client ID.		4.5.0
clientSecret	String	body (contained in the params structure)	Optional. The client key.		4.5.0
authorizationUrl	String	body (contained in the params structure)	Optional. The authentication url.		4.5.0
tokenUrl	String	body (contained in the params structure)	The authentication token url.		4.5.0
loginType	String	body (contained in the params structure)	The login type: - cas-iam1 - cas-ima2 - oauth2-iam1		4.5.0

Name	Type	Location	Description	Optional Value	Starting Version
			oauth2-iam2		
systemTags	List	body	Optional. The system tag.		4.5.0
userTags	List	body	Optional. The user tag.		4.5.0
redirectUrl	String	body (contained in the params structure)	Optional. User information url.		4.7.21
userinfoUrl	String	body (contained in the params structure)	Optional. User redirect url.		4.7.21
logoutUrl	String	body (contained in the params structure)	Optional. Logout url.		4.7.21
scopeList	List	body (contained in the params structure)	Optional. The permission scope.		5.1.8
identityProvider	String	body (contained in the params structure)	Optional. The identity provider.		5.1.8
pluginUuid (可选)	String	body (contained in the params structure)	The plugin UUID.		5.3.20

API Response

Sample Response

8.4 SNMP Operations

8.4.1 CreateSnmpAgent

API Request

URLs

```
POST zstack/v1/snmp/agent
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```

{
  "params": {
    "version": "v3",
    "userName": "zstack",
    "authAlgorithm": "SHA512",
    "authPassword": "auth_password",
    "privacyAlgorithm": "DES",
    "privacyPassword": "priv_password",
    "port": 161
  }
}

```

```

    },
    "systemTags": [],
    "userTags": []
  }

```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"version":"v3","userName":"zstack","authAlgorithm":"SHA512","authPassword":"auth
http://localhost:8080/zstack/v1/snmp/agent

```

Parameters

Name	Type	Location	Description	Valid Values	Starting Version
version	String	body (contained in the params structure)	The protocol version.	- v2c - v3	4.7.21
readCommunity	String	body (contained in the params structure)	Optional. The read community (used when for v2c version).		4.7.21
userName	String	body (contained in the params structure)	Optional. The user name (used for v3 version).		4.7.21
authAlgorithm	String	body (contained in the params structure)	Optional. The authentication algorithm.	- MD5 - SHA - SHA224 - SHA256 - SHA384 - SHA512	4.7.21

Name	Type	Location	Description	Valid Values	Starting Version
authPassword	String	body (contained in the params structure)	Optional. The authentication password.		4.7.21
privacyAlgorithm	String	body (contained in the params structure)	Optional. The privacy algorithm.	• DES • AES128 • AES192 • AES256 • 3DES	4.7.21
privacyPassword	String	body (contained in the params structure)	Optional. The privacy password.		4.7.21
port	int	body (contained in the params structure)	The port.		4.7.21
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		4.7.21
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID.		4.7.21
systemTags	List	body	Optional. the system tags.		4.7.21
userTags	List	body	Optional. The user tags.		4.7.21

action.conditions = []
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
QuerySnmpAgentAction.Result res = action.call()
```

8.4.3 StartSnmpAgent

API Request

URLs

```
PUT zstack/v1/snmp/agent/actions
```

Headers

```
Authrization: OAuth the-session-uuid
```

Body

```
{
  "startSnmpAgent": {
    "uuid": "2e5ce17390a843da991411d27b67d775"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"startSnmpAgent":
{"uuid":"955799e296a94e4aa2ce063a5b1ea4b8"}}' http://
localhost:8080/zstack/v1/snmp/agent/actions
```

Parameters

Name	Type	Location	Description	Valid Values	Starting Version
uuid	String	body (contained in the startSnmpAgent structure).	The resource UUID.		4.7.21

Name	Type	Location	Description	Valid Values	Starting Version
systemTags	List	body	Optional. The system tags.		4.7.21
userTags	List	body	Optional. The user tags.		4.7.21

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "eef797ff89d84305b51cc3edcb597909",
    "version": "v3",
    "userName": "zstack",
    "authAlgorithm": "SHA",
    "authPassword": "authPassword",
    "privacyAlgorithm": "AES128",
    "privacyPassword": "privPassword",
    "port": 162
  }
}
```

Name	Type	Description	Starting Version
success	boolean		4.7.21
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.7.21
inventory	SnmpAgentInventory	See inventory .	4.7.21

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.7.21
description	String	The brief description of the error.	4.7.21

Name	Type	Description	Starting Version
details	String	The details about the error.	4.7.21
elaboration	String	The reserved field. Default value: null.	4.7.21
opaque	LinkedHashMap	The reserved field. Default value: null.	4.7.21
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.7.21

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	4.7.21
version	String	The protocol version.	4.7.21
readCommunity	String	The read community (used for the v2c version)	4.7.21
userName	String	The user name (used for the v3 version)	4.7.21
authAlgorithm	String	The authentication algorithm.	4.7.21
authPassword	String	The authentication password.	4.7.21
privacyAlgorithm	String	The privacy algorithm.	4.7.21
privacyPassword	String	The privacy password.	4.7.21
port	int	The port.	4.7.21
status	String	The SNMP agent status.	4.7.21
securityLevel	String	The security level.	4.7.21
createDate	Timestamp	The creation date.	4.7.21

Name	Type	Description	Starting Version
lastOpDate	Timestamp	The last operation date.	4.7.21

SDK Sample

Java SDK

```
StartSnmppAgentAction action = new StartSnmppAgentAction();
action.uuid = "a74555a81a4244bb9ce0f8f2b5691ac5";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
StartSnmppAgentAction.Result res = action.call();
```

Python SDK

```
StartSnmppAgentAction action = StartSnmppAgentAction()
action.uuid = "56f7b7cc6f764c55bf4016cc2257f456"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
StartSnmppAgentAction.Result res = action.call()
```

8.4.4 StopSnmppAgent

API Request

URLs

```
PUT zstack/v1/snmp/agent/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "stopSnmppAgent": {
    "uuid": "253c4449901c49f9928d2d7fd2119715"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
```

```
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"stopSnmpAgent":
{"uuid":"d3dcbbba6129e497480af319ee4e42749"}}' http://
localhost:8080/zstack/v1/snmp/agent/actions
```

Parameters

Name	Type	Location	Description	Valid Values	Starting Version
uuid	String	body (contained in the stopSnmpAgent structure).	The resource UUID.		4.7.21
systemTags	List	body	Optional. The system tags.		4.7.21
userTags	List	body	Optional. The user tags.		4.7.21

API Response

Sample Response

```

userName	String	The user name (used for the v3 version).	4.7.21
authAlgorithm	String	The authentication algorithm.	4.7.21
authPassword	String	The authentication password.	4.7.21

Name	Type	Description	Starting Version
privacyAlgorithm	String	The privacy algorithm.	4.7.21
privacyPassword	String	The privacy password.	4.7.21
port	int	The port.	4.7.21
status	String	The SNMP agent status.	4.7.21
securityLevel	String	The security level.	4.7.21
createDate	Timestamp	The creation data.	4.7.21
lastOpDate	Timestamp	The last operation date.	4.7.21

SDK Sample

Java SDK

```
StopSnmppAgentAction action = new StopSnmppAgentAction();
action.uuid = "5b470e397e794dff84efa29375d9cef8";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
StopSnmppAgentAction.Result res = action.call();
```

Python SDK

```
StopSnmppAgentAction action = StopSnmppAgentAction()
action.uuid = "e48db055707445d3b70e8e52f7ee0ca3"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
StopSnmppAgentAction.Result res = action.call()
```

8.4.5 UpdateSnmppAgent

API Request

URLs

```
PUT zstack/v1/snmp/agent/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateSnmppAgent": {
    "version": "v2c",
    "readCommunity": "zstack",
    "port": 1161
  }
}
```

```

    },
    "systemTags": [],
    "userTags": []
  }

```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateSnmAgent":
{"version":"v2c","readCommunity":"zstack","port":1161}}' http://
localhost:8080/zstack/v1/snmp/agent/actions

```

参数列表

Name	Type	Location	Description	Valid Values	Starting Version
uuid	String	body (contained in the updateSnmAgent structure).	The resource UUID.		4.7.21
version	String	body (contained in the updateSnmAgent structure).	The protocol version.	- v2c - v3	4.7.21
readCommunity	String	body (contained in the updateSnmAgent structure).	Optional. The read community (used for the v2c version).		4.7.21
userName	String	body (contained in the updateSnmAgent structure).	Optional. The user name (used for the v3 version).		4.7.21

Name	Type	Location	Description	Valid Values	Starting Version
		Agent structure).			
authAlgorithm	String	body (contained in the updateSnmpp Agent structure).	Optional. The authentication algorithm.	• MD5 • SHA • SHA224 • SHA256 • SHA384 • SHA512	4.7.21
authPassword (可选)	String	body (contained in the updateSnmpp Agent structure).	Optional. The authentication password.		4.7.21
privacyAlgorithm	String	body (contained in the updateSnmpp Agent structure).	Optional. The privacy algorithm.	• DES • AES128 • AES192 • AES256 • 3DES	4.7.21
privacyPassword	String	body (contained in the updateSnmpp Agent structure).	Optional. The privacy password.		4.7.21
port	int	body (contained in the updateSnmpp Agent structure).	The port.		4.7.21
systemTags	List	body	Optional. The system tags.		4.7.21
userTags	List	body	Optional. The user tags.		4.7.21

```

Python SDK

```
UpdateSnmpAgentAction action = UpdateSnmpAgentAction()
action.version = "v2c"
action.readCommunity = "zstack"
action.port = 1161
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateSnmpAgentAction.Result res = action.call()
```

8.4.6 CreateSNSSnmpEndpoint

API Request

URLs

```
POST zstack/v1/sns/application-endpoints/snmp
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "snmp endpoint",
    "platformUuid": "c453382b049c3280b69157501914870d"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"name":"snmp endpoint", "platformUuid":"c453382b049c3280b69157501914870d"}}'
http://localhost:8080/zstack/v1/sns/application-endpoints/snmp
```

Parameters

Name	Type	Location	Description	Valid Values	Starting Version
name	String	body (contained in the params structure).	The resource name.		4.7.21
description	String	body (contained in the params structure).	Optional. The resource description.		4.7.21
platformUuid	String	body (contained in the params structure).	Optional. The application platform UUID.		4.7.21
resourceUuid	String	body (contained in the params structure).	Optional. The resource UUID.		4.7.21
tagUuids	List	body (contained in the params structure).	Optional. The tag UUID list.		4.7.21
systemTags	List	body	Optional. The system tags.		4.7.21
userTags	List	body	Optional. The user tags.		4.7.21

action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CreateSNSSnmpEndpointAction.Result res = action.call()
```

8.4.7 CreateSNSSnmpPlatform

API Request

URLs

```
POST zstack/v1/sns/application-platforms/snmp
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
```

```

"params": {
  "snmpAddress": "127.0.0.1",
  "snmpPort": 161,
  "name": "snmp platform"
},
"systemTags": [],
"userTags": []
}

```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params": {
  "snmpAddress": "127.0.0.1", "snmpPort": 161, "name": "snmp platform"}}'
http://localhost:8080/zstack/v1/sns/application-platforms/snmp

```

Parameters

Name	Type	Location	Description	Valid Values	Starting Version
snmpAddress	String	body (contained in the params structure).	The SNMP server address.		4.7.21
snmpPort	Integer	body (contained in the params structure).	The SNMP server port.		4.7.21
name	String	body (contained in the params structure).	The resource name.		4.7.21
description	String	body (contained in the params structure).	Optional. The resource description.		4.7.21
resourceUuid	String	body (contained in the params structure).	Optional. The resource UUID.		4.7.21

Name	Type	Location	Description	Valid Values	Starting Version
		the params structure).			
tagUuids	List	body (contained in the params structure).	Optional. The tag UUID list.		4.7.21
systemTags	List	body	Optional. The system tags.		4.7.21

    "type": "Email",
    "createDate": "Sep 28, 2023 4:34:04 PM",
    "lastOpDate": "Sep 28, 2023 4:34:04 PM"
  }
}
```

Name	Type	Description	Starting Version
success	boolean		4.7.21
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.7.21
inventory	SNSApplicationSnmpPlatformInventory	See inventory .	4.7.21

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	4.7.21
description	String	The brief description of the error.	4.7.21
details	String	The details about the error.	4.7.21
elaboration	String	The reserved field. Default value: null.	4.7.21
opaque	LinkedHashMap	The reserved field. Default value: null.	4.7.21
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.7.21

#inventory

Name	Type	Description	Starting Version
name	String	The resource name.	4.7.21
uuid	String	The resource UUID.	4.7.21
description	String	The resource description.	4.7.21
type	String	The type.	4.7.21
createDate	Timestamp	The creation date.	4.7.21
lastOpDate	Timestamp	The last operation date.	4.7.21

SDK Sample

Java SDK

```
CreateSNSSnmpPlatformAction action = new CreateSNSSnmpPlatformAction
();
action.snmpAddress = "127.0.0.1";
action.snmpPort = 161;
action.name = "snmp platform";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateSNSSnmpPlatformAction.Result res = action.call();
```

Python SDK

```
CreateSNSSnmpPlatformAction action = CreateSNSSnmpPlatformAction()
action.snmpAddress = "127.0.0.1"
action.snmpPort = 161
action.name = "snmp platform"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CreateSNSSnmpPlatformAction.Result res = action.call()
```

8.4.8 QuerySNSSnmpPlatform

API Request

URLs

```
GET zstack/v1/sns/application-platforms/snmp
GET zstack/v1/sns/application-platforms/snmp/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/sns/application-platforms/snmp?
q=name=snmp
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/sns/application-platforms/
snmp/282706a5c66231019bf6c250304903bf
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QuerySnmpAgent**, and pressing the Tab key.

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
QuerySNSSnmpPlatformAction action = new QuerySNSSnmpPlatformAction();
action.conditions = asList("name=snmp");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QuerySNSSnmpPlatformAction.Result res = action.call();
```

Python SDK

```
QuerySNSSnmpPlatformAction action = QuerySNSSnmpPlatformAction()
action.conditions = ["name=snmp"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QuerySNSSnmpPlatformAction.Result res = action.call()
```

8.4.9 UpdateSNSSnmpPlatform

API Request

URLs

```
PUT zstack/v1/sns/application-platforms/snmp/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateSNSSnmpPlatform": {
    "snmpAddress": "127.0.0.1",
    "snmpPort": 161,
    "name": "snmp platform name"
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateSNSSnmpPlatform":
{"snmpAddress":"127.0.0.1","snmpPort":161,"name":"snmp platform
name"}}' http://localhost:8080/zstack/v1/sns/application-platforms/
snmp/cbd548888e9d37b594bc99c1892589ed
```

Parameters

Name	Type	Location	Description	Valid Values	Starting Version
snmpAddress	String	body (contained in the updateSNSSnmpPlatform structure).	The SNMP server address.		4.7.21
snmpPort	Integer	body (contained in the updateSNSSnmpPlatform structure).	The SNMP server port.		4.7.21
uuid	String	url	The resource UUID.		4.7.21
name	String	body (contained in the updateSNSSnmpPlatform structure).	Optional. The resource name.		4.7.21
description	String	body (contained in the updateSNSS	Optional. The resource description.		4.7.21

Name	Type	Location	Description	Valid Values	Starting Version
		nmpPlatform structure).			
systemTags	List	body	Optional. The system tags.		4.7.21
userTags	List	body	Optional. The user tags.		4.7.21

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "38c619bf4e7a4cdaa04fcb44d85d5fc9",
    "name": "email platform",
    "description": "example description",
    "state": "Enabled",
    "type": "Email",
    "createDate": "Sep 28, 2023 4:32:51 PM",
    "lastOpDate": "Sep 28, 2023 4:32:51 PM"
  }
}
```

Name	Type	Description	Starting Version
success	boolean		4.7.21
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.7.21
inventory	authentication	See inventory .	4.7.21

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.7.21

Name	Type	Description	Starting Version
description	String	The brief description of the error.	4.7.21
details	String	The details about the error.	4.7.21
elaboration	String	The reserved field. Default value: null.	4.7.21
opaque	LinkedHashMap	The reserved field. Default value: null.	4.7.21
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.7.21

#inventory

Name	Type	Description	Starting Version
name	String	The resource name.	4.7.21
uuid	String	The resource UUID.	4.7.21
description	String	The resource description.	4.7.21
type	String	The type.	4.7.21
createDate	Timestamp	The creation date.	4.7.21
lastOpDate	Timestamp	The last operation date.	4.7.21

SDK Sample

Java SDK

```
UpdateSNSSnmpPlatformAction action = new UpdateSNSSnmpPlatformAction
();
action.snmpAddress = "127.0.0.1";
action.snmpPort = 161;
action.uuid = "cbd548888e9d37b594bc99c1892589ed";
action.name = "snmp platform name";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
UpdateSNSSnmpPlatformAction.Result res = action.call();
```

Python SDK

```
UpdateSNSSnmpPlatformAction action = UpdateSNSSnmpPlatformAction()
action.snmpAddress = "127.0.0.1"
action.snmpPort = 161
action.uuid = "cbd548888e9d37b594bc99c1892589ed"
action.name = "snmp platform name"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateSNSSnmpPlatformAction.Result res = action.call()
```

8.5 Plugin Operations

8.5.1 DeletePluginDrivers

API Request

URLs

```
DELETE zstack/v1/external/plugins/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/external/plugins/
e90949fe5ddd3e68a4646b97b812f905
```

Request Parameters

Name	Type	Location	Description	Valid Values	Starting Version
uuid	String	body (contained in the params structure)	The resource UUID.		5.3.28
systemTags	List	body	Optional. The system tags.		5.3.28
userTags	List	body	Optional. The user tags.		5.3.28
deleteMode	String	body	Optional. The deletion		5.3.28

Name	Type	Location	Description	Valid Values	Starting Version
			mode (Permissive / Enforcing, Permissive).		

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeletePluginDriversAction action = new DeletePluginDriversAction();
action.uuid = "e90949fe5ddd3e68a4646b97b812f905";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeletePluginDriversAction.Result res = action.call();
```

Python SDK

```
DeletePluginDriversAction action = DeletePluginDriversAction()
action.uuid = "e90949fe5ddd3e68a4646b97b812f905"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
DeletePluginDriversAction.Result res = action.call()
```

8.5.2 RefreshPluginDrivers

API Request

URLs

```
PUT zstack/v1/external/plugins
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "refreshPluginDrivers": {
    "name": "prometheus"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"refreshPluginDrivers":{"name":"prometheus"}}' http://
localhost:8080/zstack/v1/external/plugins
```

Request Parameters

Name	Type	Location	Description	Valid Values	Description
uuid	String	body (contained in the params structure)	The resource UUID.		5.3.28
systemTags	List	body	Optional. The system tags.		5.3.28
userTags	List	body	Optional. The user tags.		5.3.28

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
RefreshPluginDriversAction action = new RefreshPluginDriversAction();
action.name = "prometheus";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
RefreshPluginDriversAction.Result res = action.call();
```

Python SDK

```
RefreshPluginDriversAction action = RefreshPluginDriversAction()
action.name = "prometheus"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
RefreshPluginDriversAction.Result res = action.call()
```

8.6 Settings Operations

8.6.1 Global Settings Operations

8.6.1.1 QueryGlobalConfig

API Request

URLs

```
GET zstack/v1/global-configurations
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 036d9a68cd8243e99e8d740eaf8b4baf" \
```

```
-X GET http://localhost:8080/zstack/v1/global-configurations
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryGlobalConfig**, and pressing the Tab key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "name": "reservedCapacity",
      "category": "backupStorage",
      "description": "Reserved capcacity on every backup storage",
      "defaultValue": "1G",
      "value": "2G"
    }
  ]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventories	List	See inventories .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6

Name	Type	Description	Starting Version
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventories

Name	Type	Description	Starting Version
name	String	The resource name.	0.6
category	String		0.6
description	String	The detailed description of the resource.	0.6
defaultValue	String		0.6
value	String		0.6

SDK Sample

Java SDK

```
QueryGlobalConfigAction action = new QueryGlobalConfigAction();
action.conditions = asList();
action.sessionId = "8509eaa6301b4935a4b100a05f1fe2ba";
QueryGlobalConfigAction.Result res = action.call();
```

Python SDK

```
QueryGlobalConfigAction action = QueryGlobalConfigAction()
action.conditions = []
action.sessionId = "e085fdf6aa354291b71ae8dc5fa880fe"
```

```
QueryGlobalConfigAction.Result res = action.call()
```

8.6.1.2 UpdateGlobalConfig

API Request

URLs

```
PUT zstack/v1/global-configurations/{category}/{name}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateGlobalConfig": {
    "value": "90"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateGlobalConfig":{"value":"90"}}' \
http://localhost:8080/zstack/v1/global-configurations/quota/scheduler.num/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
category	String	url	The category.		0.6
name	String	url	The resource name.		0.6
value	String	body (contained in the updateGlob	Optional. The value.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
		alConfig structure)			
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {
    "name": "scheduler.num",
    "category": "quota",
    "description": "default quota for scheduler.num",
    "defaultValue": "80",
    "value": "90"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventory	GlobalConfigInventory	See inventory .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6

Name	Type	Description	Starting Version
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventory

Name	Type	Description	Starting Version
name	String	The resource name.	0.6
category	String		0.6
description	String	The detailed description of the resource.	0.6
defaultValue	String		0.6
value	String		0.6

SDK Sample

Java SDK

```
UpdateGlobalConfigAction action = new UpdateGlobalConfigAction();
action.category = "quota";
action.name = "scheduler.num";
action.value = "90";
action.sessionId = "84a1a9ed2d54449db13e01f7d6face7e";
UpdateGlobalConfigAction.Result res = action.call();
```

Python SDK

```
UpdateGlobalConfigAction action = UpdateGlobalConfigAction()
action.category = "quota"
action.name = "scheduler.num"
action.value = "90"
action.sessionId = "b077cfa8599a4ff1ac4fd7ba67b20a82"
```

```
UpdateGlobalConfigAction.Result res = action.call()
```

8.6.1.3 ResetGlobalConfig

API Request

URLs

```
PUT zstack/v1/global-configurations/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "resetGlobalConfig": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"resetGlobalConfig":{}}' http://localhost:8080/zstack/v1/global-configurations/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	body	Optional. The system tags.		3.1.0
userTags	List	body	Optional. The user tags.		3.1.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
ResetGlobalConfigAction action = new ResetGlobalConfigAction();
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
ResetGlobalConfigAction.Result res = action.call();
```

Python SDK

```
ResetGlobalConfigAction action = ResetGlobalConfigAction()
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
ResetGlobalConfigAction.Result res = action.call()
```

8.6.2 Advanced Settings Operations

8.6.2.1 GetResourceConfig

API Request

URLs

```
GET zstack/v1/resource-configurations/{resourceUuid}/{category}/{name}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/resource-
configurations/77663dd5ff84460bbf1817aa3c59d125/host/
cpu.overProvisioning.ratio
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
category	String	url	The setting category.		3.4.0
name	String	url	The setting name.		3.4.0
resourceUuid	String	url	The resource UUID.		3.4.0
systemTags	List	query	Optional. The system tags.		3.4.0
userTags	List	query	Optional. The user tags.		3.4.0

API Response

Sample Response

```
{
  "value": "5",
  "effectiveConfigs": [
    {
      "uuid": "dae9aeb6d74e4f44823f2e0c4f1cc79f",
      "resourceUuid": "46597de31eac41539c4e6eda52885769",
      "resourceType": "HostV0",
      "name": "cpu.overProvisioning.ratio",
      "category": "host",
      "value": "5",
      "createDate": "Nov 14, 2017 10:20:57 PM",
      "lastOpDate": "Nov 14, 2017 10:20:57 PM"
    },
    {
      "uuid": "5c3c94a73d7b4a95a1818241f2e427ae",
      "resourceUuid": "371519310f344695854de27bb9743121",
      "resourceType": "ClusterV0",
      "name": "cpu.overProvisioning.ratio",
      "category": "host",
      "value": "10",
      "createDate": "Nov 14, 2017 10:20:57 PM",
      "lastOpDate": "Nov 14, 2017 10:20:57 PM"
    }
  ]
}
```

Name	Type	Description	Starting Version
value	String	The setting value.	3.4.0
success	boolean		3.4.0

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.4.0
effectiveConfigs	List	The setting list that takes effect. Settings are ordered from high to low priorities. For more information, see effectiveConfigs .	3.4.0
error	ErrorCode	See error .	3.4.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.4.0
description	String	The brief description of the error.	3.4.0
details	String	The details about the error.	3.4.0
elaboration	String	The reserved field. Default value: null.	3.4.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.4.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.4.0

#effectiveConfigs

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.4.0
resourceUuid	String	The resource UUID corresponded by the setting.	3.4.0
resourceType	String	The resource type corresponded by the setting.	3.4.0
name	String	The setting name.	3.4.0
description	String	The detailed description of the setting.	3.4.0
category	String	The setting category.	3.4.0
value	String	The setting value.	3.4.0
createDate	Timestamp	The creation date.	3.4.0
lastOpDate	Timestamp	The last operation date.	3.4.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.4.0
description	String	The brief description of the error.	3.4.0
details	String	The details about the error.	3.4.0
elaboration	String	The reserved field. Default value: null.	3.4.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.4.0
cause	ErrorCode	The root error, which is the associated root cause of the current	3.4.0

Name	Type	Description	Starting Version
		error. If no root error exists, this parameter is null.	

SDK Sample

Java SDK

```
GetResourceConfigAction action = new GetResourceConfigAction();
action.category = "host";
action.name = "cpu.overProvisioning.ratio";
action.resourceUuid = "70fdcc564f564c29af98e48e78be56e4";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetResourceConfigAction.Result res = action.call();
```

Python SDK

```
GetResourceConfigAction action = GetResourceConfigAction()
action.category = "host"
action.name = "cpu.overProvisioning.ratio"
action.resourceUuid = "b1ea1d424bf04a50b15b33bcd0f8a80d"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetResourceConfigAction.Result res = action.call()
```

8.6.2.2 GetResourceBindableConfig

API Request

URLs

```
GET zstack/v1/resource-configurations/bindable
GET zstack/v1/resource-configurations/bindable/{category}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/resource-configurations/
bindable?category=host
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/resource-configurations/
bindable/host?category=host
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
category	String	query	Optional. The setting category.		3.4.0
systemTags	List	query	Optional. The system tags.		3.4.0
userTags	List	query	Optional. The user tags.		3.4.0

API Response

Sample Response

```
{
  "bindableConfigs": [
    {
      "name": "cpu.overProvisioning.ratio",
      "category": "host",
      "bindResourceTypes": [
        "HostVO",
        "ClusterVO",
        "ZoneVO"
      ]
    }
  ]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.4.0
bindableConfigs	List	See bindableConfigs .	3.4.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error	3.4.0

Name	Type	Description	Starting Version
		. For example, SYS.1000, HOST.1001.	
description	String	The brief description of the error.	3.4.0
details	String	The details about the error.	3.4.0
elaboration	String	The reserved field. Default value: null.	3.4.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.4.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.4.0

#bindableConfigs

Name	Type	Description	Starting Version
name	String	The setting name.	3.4.0
category	String	The setting category.	3.4.0
description	String	The detailed description of the setting.	3.4.0
bindResourceTypes	List	The resource types that can be bound by the setting.	3.4.0

SDK Sample

Java SDK

```

GetResourceBindableConfigAction action = new GetResourceBindableConfigAction();
action.category = "host";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";

```

```
GetResourceBindableConfigAction.Result res = action.call();
```

Python SDK

```
GetResourceBindableConfigAction action = GetResourceBindableC
onfigAction()
action.category = "host"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetResourceBindableConfigAction.Result res = action.call()
```

8.6.2.3 DeleteResourceConfig

API Request

URLs

```
DELETE zstack/v1/resource-configurations/{category}/{name}/
{resourceUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/resource-configurations/
host/cpu.overProvisioning.ratio/02bcf0b045e247e59bfd51630064443f
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
category	String	url	The setting category.		3.4.0
name	String	url	The setting name.		3.4.0
resourceUuid	String	url	The resource UUID.		3.4.0
deleteMode	String	body	Optional. The delete mode.		3.4.0
systemTags	List	body	Optional. The system tags.		3.4.0
userTags	List	body	Optional. The user tags.		3.4.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteResourceConfigAction action = new DeleteResourceConfigAction();
action.category = "host";
action.name = "cpu.overProvisioning.ratio";
action.resourceUuid = "763612d48d514b35a7df506cf1a23f57";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteResourceConfigAction.Result res = action.call();
```

Python SDK

```
DeleteResourceConfigAction action = DeleteResourceConfigAction()
action.category = "host"
action.name = "cpu.overProvisioning.ratio"
action.resourceUuid = "4ac85edbee2c489ea58e3f26b53182de"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteResourceConfigAction.Result res = action.call()
```

8.6.2.4 QueryResourceConfig

API Request

URLs

```
GET zstack/v1/resource-configurations
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X GET http://localhost:8080/zstack/v1/resource-configurations
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryResourceConfig**, and pressing the Tab key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "uuid": "4944c2599c394bd5be5ccc1099dfdb4b",
      "resourceUuid": "45a511dfef1b474dbef3c1ff88275465",
      "resourceType": "ClusterV0",
      "name": "cpu.overProvisioning.ratio",
      "category": "host",
      "value": "10",
      "createDate": "Nov 14, 2017 10:20:57 PM",
      "lastOpDate": "Nov 14, 2017 10:20:57 PM"
    }
  ]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.4.0
inventories	List	See inventories .	3.4.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.4.0
description	String	The brief description of the error.	3.4.0
details	String	The details about the error.	3.4.0

Name	Type	Description	Starting Version
elaboration	String	The reserved field. Default value: null.	3.4.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.4.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.4.0

#inventories

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.4.0
resourceUuid	String	The resource UUID corresponded by the setting.	3.4.0
resourceType	String	The resource type corresponded by the setting.	3.4.0
name	String	The setting name.	3.4.0
description	String	The detailed description of the setting.	3.4.0
category	String	The setting category.	3.4.0
value	String	The setting value.	3.4.0
createDate	Timestamp	The creation date.	3.4.0
lastOpDate	Timestamp	The last operation date.	3.4.0

SDK Sample

Java SDK

```
QueryResourceConfigAction action = new QueryResourceConfigAction();
action.conditions = asList();
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
QueryResourceConfigAction.Result res = action.call();
```

Python SDK

```
QueryResourceConfigAction action = QueryResourceConfigAction()
action.conditions = []
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryResourceConfigAction.Result res = action.call()
```

8.6.2.5 UpdateResourceConfig

API Request

URLs

```
PUT zstack/v1/resource-configurations/{category}/{name}/
{resourceUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateResourceConfig": {
    "value": "10"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateResourceConfig":{"value":"10"}}' http://
localhost:8080/zstack/v1/resource-configurations/host/
cpu.overProvisioning.ratio/afd5f67a253b4990b9e8160672357eed/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
category	String	url	The setting category.		3.4.0
name	String	url	The setting name.		3.4.0
resourceUuid	String	url	The resource UUID.		3.4.0
value	String	body (contained in the updateResourceConfig structure)	The setting value.		3.4.0
systemTags	List	body	Optional. The system tags.		3.4.0
userTags	List	body	Optional. The user tags.		3.4.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "ce61962673574ff689e2e6cb6f8cf558",
    "resourceUuid": "435a7c71c82b4b0b971f4674ab346822",
    "resourceType": "ClusterVO",
    "name": "cpu.overProvisioning.ratio",
    "category": "host",
    "value": "10",
    "createDate": "Nov 14, 2017 10:20:57 PM",
    "lastOpDate": "Nov 14, 2017 10:20:57 PM"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.4.0

Name	Type	Description	Starting Version
inventory	ResourceConfigInventory	See inventory .	3.4.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.4.0
description	String	The brief description of the error.	3.4.0
details	String	The details about the error.	3.4.0
elaboration	String	The reserved field. Default value: null.	3.4.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.4.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.4.0

#inventory

Name	Type	Description	Starting Version

resourceUuid	String	The resource UUID corresponded by the setting.	3.4.0
resourceType	String	The resource type corresponded by the setting.	3.4.0

Name	Type	Description	Starting Version
name	String	The setting name.	3.4.0
description	String	The detailed description of the setting.	3.4.0
category	String	The setting category.	3.4.0
value	String	The setting value.	3.4.0
createDate	Timestamp	The creation date.	3.4.0
lastOpDate	Timestamp	The last operation date.	3.4.0

SDK Sample

Java SDK

```
UpdateResourceConfigAction action = new UpdateResourceConfigAction();
action.category = "host";
action.name = "cpu.overProvisioning.ratio";
action.resourceUuid = "5fa296dff4f04c96b29f38bef93e9e15";
action.value = "10";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateResourceConfigAction.Result res = action.call();
```

Python SDK

```
UpdateResourceConfigAction action = UpdateResourceConfigAction()
action.category = "host"
action.name = "cpu.overProvisioning.ratio"
action.resourceUuid = "1e0f389aca364a1f94929bb4f39597b3"
action.value = "10"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
UpdateResourceConfigAction.Result res = action.call()
```

8.6.3 Template Operations

8.6.3.1 ApplyTemplateConfig

API Request

URLs

```
PUT zstack/v1/template-configurations/{templateUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "applyTemplateConfig": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"applyTemplateConfig":{}}' http://localhost:8080/zstack/
v1/template-configurations/00000000/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
templateUuid	String	url	The template UUID.		3.6.0
systemTags	List	body	Optional. The system tags.		3.6.0
userTags	List	body	Optional. The user tags.		3.6.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
ApplyTemplateConfigAction action = new ApplyTemplateConfigAction();
action.templateUuid = "000000000";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
ApplyTemplateConfigAction.Result res = action.call();
```

Python SDK

```
ApplyTemplateConfigAction action = ApplyTemplateConfigAction()
action.templateUuid = "000000000"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
ApplyTemplateConfigAction.Result res = action.call()
```

8.6.3.2 QueryGlobalConfigTemplate

API Request

URLs

```
GET zstack/v1/template-configurations/templates
GET zstack/v1/template-configurations/templates/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/template-configurations/
templates?
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryGlobalConfigTemplate**, and pressing the Tab key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "uuid": "reservedCapacity",
      "name": "scenes1",
      "type": "System",
      "description": "For scenes1"
    }
  ]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.6.0
inventories	List	See inventories .	3.6.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.6.0
description	String	The brief description of the error.	3.6.0
details	String	The details about the error.	3.6.0
elaboration	String	The reserved field. Default value: null.	3.6.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.6.0

Name	Type	Description	Starting Version
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.6.0

#inventories

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.6.0
name	String	The template name.	3.6.0
type	String	The template type.	3.6.0
description	String	The detailed description of and the recommended scenario of the template.	3.6.0

SDK Sample

Java SDK

```
QueryGlobalConfigTemplateAction action = new QueryGlobalConfigTemplateAction();
action.conditions = asList();
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryGlobalConfigTemplateAction.Result res = action.call();
```

Python SDK

```
QueryGlobalConfigTemplateAction action = QueryGlobalConfigTemplateAction()
action.conditions = []
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryGlobalConfigTemplateAction.Result res = action.call()
```

8.6.3.3 QueryTemplateConfig**API Request**

URLs

```
GET zstack/v1/template-configurations/configs
```

```
GET zstack/v1/template-configurations/configs/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/template-configurations/
configs?
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryTemplateConfig**, and pressing the Tab key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "templateUuid": "0000111122223333",
      "category": "backupStorage",
      "name": "reservedCapacity",
      "defaultValue": "1G",
      "value": "2G"
    }
  ]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.6.0
inventories	List	See inventories .	3.6.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error	3.6.0

Name	Type	Description	Starting Version
		. For example, SYS.1000, HOST.1001.	
description	String	The brief description of the error.	3.6.0
details	String	The details about the error.	3.6.0
elaboration	String	The reserved field. Default value: null.	3.6.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.6.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.6.0

#inventories

value	String	The template value.	3.6.0

SDK Sample

Java SDK

```
QueryTemplateConfigAction action = new QueryTemplateConfigAction();
action.conditions = asList();
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryTemplateConfigAction.Result res = action.call();
```

Python SDK

```
QueryTemplateConfigAction action = QueryTemplateConfigAction()
action.conditions = []
```

```
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryTemplateConfigAction.Result res = action.call()
```

8.6.3.4 UpdateTemplateConfig

API Request

URLs

```
PUT zstack/v1/template-configurations/{templateUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateTemplateConfig": {
    "category": "quota",
    "name": "scheduler.num",
    "value": "90"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateTemplateConfig":
{"category":"quota","name":"scheduler.num","value":"90"}}' http://
localhost:8080/zstack/v1/template-configurations/0000/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
templateUuid	String	url	The template UUID.		3.6.0
category	String	body (contained in the	The corresponding		3.6.0

Name	Type	Location	Description	Optional Value	Starting Version
		updateTemplateConfig structure)	global setting category.		
name	String	body (contained in the updateTemplateConfig structure)	The corresponding global setting name.		3.6.0
value	String	body (contained in the updateTemplateConfig structure)	The template value.		3.6.0
systemTags	List	body	Optional. The system tags.		3.6.0
userTags	List	body	Optional. The user tags.		3.6.0

API Response

Sample Response

```
{
  "inventory": {
    "templateUuid": "000011112222",
    "category": "vm",
    "name": "emulateHyperv",
    "defaultValue": "true",
    "value": "true"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.6.0

Name	Type	Description	Starting Version
inventory	TemplateConfigInventory	See inventory .	3.6.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.6.0
description	String	The brief description of the error.	3.6.0
details	String	The details about the error.	3.6.0
elaboration	String	The reserved field. Default value: null.	3.6.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.6.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.6.0

#inventory

Name	Type	Description	Starting Version
templateUuid	String	The template UUID.	3.6.0
category	String	The setting category.	3.6.0
name	String	The setting name.	3.6.0
defaultValue	String	The default template value.	3.6.0
value	String	The template value.	3.6.0

SDK Sample

Java SDK

```
UpdateTemplateConfigAction action = new UpdateTemplateConfigAction();
action.templateUuid = "0000";
action.category = "quota";
action.name = "scheduler.num";
action.value = "90";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateTemplateConfigAction.Result res = action.call();
```

Python SDK

```
UpdateTemplateConfigAction action = UpdateTemplateConfigAction()
action.templateUuid = "0000"
action.category = "quota"
action.name = "scheduler.num"
action.value = "90"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateTemplateConfigAction.Result res = action.call()
```

8.6.3.5 ResetTemplateConfig

API Request

URLs

```
PUT zstack/v1/template-configurations/{templateUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "resetTemplateConfig": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X PUT -d '{"resetTemplateConfig":{}}' http://localhost:8080/zstack/v1/template-configurations/00000000/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
templateUuid	String	url	The template UUID.		3.6.0
systemTags	List	body	Optional. The system tags.		3.6.0
userTags	List	body	Optional. The user tags.		3.6.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
ResetTemplateConfigAction action = new ResetTemplateConfigAction();
action.templateUuid = "00000000";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
ResetTemplateConfigAction.Result res = action.call();
```

Python SDK

```
ResetTemplateConfigAction action = ResetTemplateConfigAction()
action.templateUuid = "00000000"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
ResetTemplateConfigAction.Result res = action.call()
```

8.6.3.6 RevertTemplateConfig

API Request

URLs

```
PUT zstack/v1/template-configurations/{templateUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "resetTemplateConfig": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \-X PUT
-d '{"revertTemplateConfig":{}}' http://localhost:8080/zstack/v1/
template-configurations/fd5ae067a0b037d2af3a6ec060c4be86/actions
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
templateUuid	String	url	The template UUID.		4.6.21
systemTags	List	body	Optional. The system tags.		4.6.21
userTags	List	body	Optional. The user tags.		4.6.21

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
RevertTemplateConfigAction action = new RevertTemplateConfigAction();
action.templateUuid = "fd5ae067a0b037d2af3a6ec060c4be86";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
RevertTemplateConfigAction.Result res = action.call();
```

Python SDK

```
RevertTemplateConfigAction action = RevertTemplateConfigAction()
action.templateUuid = "fd5ae067a0b037d2af3a6ec060c4be86"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
RevertTemplateConfigAction.Result res = action.call()
```

8.6.4 HA Policy Operations

8.6.4.1 UpdateHaStrategyCondition

API Request

URLs

```
PUT zstack/v1/ha-strategy-condition/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateHaStrategyCondition": {
    "name": "new ha strategycondition name",
    "state": "Enable"
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateHaStrategyCondition":{"name":"new
  ha strategycondition name","state":"Enable"}}'
http://localhost:8080/zstack/v1/ha-strategy-condition/
bf798f9ae94f3007a293f090ec555d57/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		4.7.0
name	String	body (contained in the updateHaStrategyCondition structure)	Optional. The resource name.		4.7.0
state	String	body(contained in the updateHaStrategyCondition structure)	Optional. The state		4.7.0
systemTags	List	body	Optional. The system tags.		4.7.0
userTags	List	body	Optional. The user tags.		4.7.0

API Response**Sample Response**

{

```

"inventory": {
  "uuid": "9a01c1cea2793814b8b1bf228a2ff601",
  "name": "test",
  "fencerName": "hostStorageState"
}
}

```

Name	Type	Description	Starting Version
success	boolean		4.7.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.7.0
inventory	ResourceConfigInventory	See inventory .	4.7.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.7.0
description	String	The brief description of the error.	4.7.0
details	String	The details about the error.	4.7.0
elaboration	String	The reserved field. Default value: null.	4.7.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.7.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.7.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	4.7.0
name	String	The resource name.	4.7.0
fencerName	String	The fencer name.	4.7.0
state	String	The state.	4.7.0
createDate	Timestamp	The creation date.	4.7.0
lastOpDate	Timestamp	The last operation date.	4.7.0

SDK Sample

Java SDK

```
UpdateHaStrategyConditionAction action = new UpdateHaStrategyConditionAction();
action.uuid = "bf798f9ae94f3007a293f090ec555d57";
action.name = "new ha strategycondition name";
action.state = "Enable";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateHaStrategyConditionAction.Result res = action.call();
```

Python SDK

```
UpdateHaStrategyConditionAction action = UpdateHaStrategyConditionAction()
action.uuid = "bf798f9ae94f3007a293f090ec555d57"
action.name = "new ha strategycondition name"
action.state = "Enable"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
UpdateHaStrategyConditionAction.Result res = action.call()
```

8.7 Chrony Servers Operations

8.7.1 CheckNetworkReachable

API Request

URLs

```
GET zstack/v1/zops/check/network
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8"
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c"
-X GET http://localhost:8080/zstack/v1/zops/check/network?
sourceHostnames=172.0.0.1&targetHostnames=test1.com&targetHostnames=test2.com
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
sourceHost names	List	query	Optional. Specified set of source ip addresses or domain names .		4.7.21
targetHost names	List	query	Specified set of target ip addresses or domain names .		4.7.21
systemTags	List	query	Optional. The system tags.		4.7.21
userTags	List	query	Optional. The user tags.		4.7.21

API Response

Response Sample

```
{
  "results": [
    {
      "sourceHostname": "172.0.0.1",
      "targetHostname": "test2.com",
      "status": "Disconnected"
    },
    {}
  ]
}
```

Name	Type	Description	Starting Version
success	boolean		4.7.21
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.7.21
results	List	See results .	4.7.21

#results

Name	Type	Description	Starting Version
sourceHostname	String	The source address.	4.7.21
targetHostname	String	The target address.	4.7.21
status	HostConnectedStatus	See status .	4.7.21

#status

Name	Type	Description	Starting Version
Connected	HostConnectedStatus	The network is connected.	4.7.21
Disconnected	HostConnectedStatus	The network is disconnected.	4.7.21
Unknown	HostConnectedStatus	The network status is unknown.	4.7.21

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	4.7.21
description	String	The brief description of the error.	4.7.21
details	String	The details about the error.	4.7.21
elaboration	String	The reserved field. Default value: null.	4.7.21
opaque	LinkedHashMap	The reserved field. Default value: null.	4.7.21
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.7.21

SDK Sample

Java SDK

```
CheckNetworkReachableAction action = new CheckNetworkReachableAction
();
action.sourceHostnames = asList("172.0.0.1");
action.targetHostnames = asList("test1.com", "test2.com");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CheckNetworkReachableAction.Result res = action.call();
```

Python SDK

```
CheckNetworkReachableAction action = CheckNetworkReachableAction()
action.sourceHostnames = [172.0.0.1]
action.targetHostnames = [test1.com, test2.com]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
CheckNetworkReachableAction.Result res = action.call()
```

8.7.2 SyncChronyServers

API Request

URLs

```
PUT zstack/v1/zops/chrony/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "syncChronyServers": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8"
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c"
-X PUT -d '{"syncChronyServers":{}}'
http://localhost:8080/zstack/v1/zops/chrony/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	body	Optional. The system tags.		4.7.21
userTags	List	body	Optional. The user tags.		4.7.21

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
SyncChronyServersAction action = new SyncChronyServersAction();
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
SyncChronyServersAction.Result res = action.call();
```

Python SDK

```
SyncChronyServersAction action = SyncChronyServersAction()
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
SyncChronyServersAction.Result res = action.call()
```

8.7.3 UpdateChronyServers

API Request

URLs

```
PUT zstack/v1/zops/chrony/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateChronyServers": {
    "internalHostnames": [
      "172.0.0.1",
      "172.0.0.2"
    ],
    "externalHostnames": [
      "test1.ntp.com"
    ]
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8"
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c"
-X PUT -d '{"updateChronyServers":{"internalHostnames":
["172.0.0.1","172.0.0.2"],"externalHostnames":["test1.ntp.com"]}}'
http://localhost:8080/zstack/v1/zops/chrony/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
internalHostnames	List	body (contained in the updateChronyServers structure)	Optional. Collection of internal chrony servers.		4.7.21
externalHostnames	List	body (contained in the updateChronyServers structure)	Optional. Collection of external chrony servers.		4.7.21
systemTags	List	body	Optional. The system tags.		4.7.21
userTags	List	body	Optional. The user tags.		4.7.21

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
}
```

SDK Sample

Java SDK

```
UpdateChronyServersAction action = new UpdateChronyServersAction();
action.internalHostnames = asList("172.0.0.1", "172.0.0.2");
action.externalHostnames = asList("test1.ntp.com");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateChronyServersAction.Result res = action.call();
```

Python SDK

```
UpdateChronyServersAction action = UpdateChronyServersAction()
action.internalHostnames = [172.0.0.1, 172.0.0.2]
action.externalHostnames = [test1.ntp.com]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateChronyServersAction.Result res = action.call()
```

8.7.4 GetChronyServers

API Request

URLs

```
GET zstack/v1/zops/chrony/servers
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8"
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c"
-X GET http://localhost:8080/zstack/v1/zops/chrony/servers?
```

Request Parameters

名字	类型	位置	描述	可选值	起始版本
systemTags	List	query	Optional. The system tags.		4.7.21
userTags	List	query	Optional. The user tags.		4.7.21

API Response

Response Sample

```
{
  "servers": [
    {
      "internal": {
        "hostname": "172.0.0.1",
        "status": "Connected"
      },
      "external": {
        "hostname": "ntp.test.com",
        "status": "Connected"
      }
    }
  ]
}
```

Name	Type	Description	Starting Version
success	boolean		4.7.21
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.7.21
servers	List	See servers .	4.7.21

#servers

Name	Type	Description	Starting Version
internal	ChronyServerInfo	See internal .	4.7.21
external	ChronyServerInfo	See external .	4.7.21

#internal

Name	Type	Description	Starting Version
hostname	String	Address.	4.7.21
status	HostConnectedStatus	See status .	4.7.21

#status

Name	Type	Description	Starting Version
Connected	HostConnectedStatus	The network is connected.	4.7.21
Disconnected	HostConnectedStatus	The network is disconnected.	4.7.21
Unknown	HostConnectedStatus	The network status is unknown.	4.7.21

#external

Name	Type	Description	Starting Version
hostname	String	Address.	4.7.21
status	HostConnectedStatus	See status .	4.7.21

#status

Name	Type	Description	Starting Version
Connected	HostConnectedStatus	The network is connected.	4.7.21
Disconnected	HostConnectedStatus	The network is disconnected.	4.7.21
Unknown	HostConnectedStatus	The network status is unknown.	4.7.21

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.7.21
description	String	The brief description of the error.	4.7.21
details	String	The details about the error.	4.7.21

Name	Type	Description	Starting Version
elaboration	String	The reserved field. Default value: null.	4.7.21
opaque	LinkedHashMap	The reserved field. Default value: null.	4.7.21
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.7.21

SDK Sample

Java SDK

```
GetChronyServersAction action = new GetChronyServersAction();  
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";  
GetChronyServersAction.Result res = action.call();
```

Python SDK

```
GetChronyServersAction action = GetChronyServersAction()  
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"  
GetChronyServersAction.Result res = action.call()
```

9 System Global Type

9.1 Management Node Operations

9.1.1 QueryManagementNode

API Request

URLs

```
GET zstack/v1/management-nodes
GET zstack/v1/management-nodes/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth f5db0d0f90104a79b02c8f1c34dfc13b" \
-X GET http://localhost:8080/zstack/v1/management-nodes?
q=uuid=2c0761c3720f4d2c93435f1b8edb1297
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 5ffa91907f3c4d0392d7daa73b1a0627" \
-X GET http://localhost:8080/zstack/v1/management-nodes/
bc27558979364d7c9b34a7317965e0be
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryManagementNode**, and pressing the Tab key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "uuid": "188b2c6376c34d3687c5a7a19685ffa6",
      "hostName": "127.0.0.1",
      "joinDate": "May 11, 2017 1:22:44 PM",
      "heartBeat": "May 11, 2017 1:22:44 PM"
    }
  ]
}
```

}

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventories	List	See inventories .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventories

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
hostName	String	The hostname.	0.6

Name	Type	Description	Starting Version
joinDate	Timestamp	The joining date.	0.6
heartBeat	Timestamp	The heartbeat time.	0.6

SDK Sample

Java SDK

```
QueryManagementNodeAction action = new QueryManagementNodeAction();
action.conditions = asList("uuid=7c2075262bb44872b6ceaef5ee94b089");
action.sessionId = "293267e661d8400ca3808ff5f445a6e8";
QueryManagementNodeAction.Result res = action.call();
```

Python SDK

```
QueryManagementNodeAction action = QueryManagementNodeAction()
action.conditions = ["uuid=3bcbd030e10746eeba9f8ea938f2647a"]
action.sessionId = "21526cb97ac541b6b27192b4c671ec08"
QueryManagementNodeAction.Result res = action.call()
```

9.1.2 GetVersion

API Request

URLs

```
PUT zstack/v1/management-nodes/actions
```

Body

```
{
  "getVersion": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-X PUT -d '{"getVersion":{}}' http://localhost:8080/zstack/v1/
management-nodes/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "version": "1.9.x"
}
```

Name	Type	Description	Starting Version
version	String	The current version of the management node.	0.6
success	boolean	Whether the API succeeds.	0.6
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6

Name	Type	Description	Starting Version
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

SDK Sample

Java SDK

```
GetVersionAction action = new GetVersionAction();
GetVersionAction.Result res = action.call();
```

Python SDK

```
GetVersionAction action = GetVersionAction()
GetVersionAction.Result res = action.call()
```

9.1.3 GetCurrentTime

API Request

URLs

```
PUT zstack/v1/management-nodes/actions
```

Body

```
{
  "getCurrentTime": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
```

```
-X PUT -d '{"currentTime":{}}' http://localhost:8080/zstack/v1/management-nodes/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "currentTime": {
    "MillionSeconds": 1.494480176967E12,
    "Seconds": 1.494480176E9
  }
}
```

Name	Type	Description	Starting Version
currentTime	Map	The current time of the management node.	0.6
success	boolean	Whether the API succeeds.	0.6
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6

Name	Type	Description	Starting Version
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

SDK Sample

Java SDK

```
GetCurrentTimeAction action = new GetCurrentTimeAction();
GetCurrentTimeAction.Result res = action.call();
```

Python SDK

```
GetCurrentTimeAction action = GetCurrentTimeAction()
GetCurrentTimeAction.Result res = action.call()
```

9.1.4 GetPlatformTimeZone

API Request

URLs

```
GET zstack/v1/management-nodes/platform-timezone
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
```

```
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" -X GET
http://localhost:8080/zstack/v1/management-nodes/platform-timezone?
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
systemTags	List	body	Optional. The system tags.		4.1.0
userTags	List	body	Optional. The user tags.		4.1.0

API Response

Sample Response

```
{
  "timezone": "Asia/Shanghai",
  "offset": "+8:00"
}
```

Name	Type	Description	Starting Version
timezone	String	The time zone.	4.1.0
offset	String	The time difference with GMT	4.1.0
success	boolean		4.1.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.1.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.1.0

Name	Type	Description	Starting Version
description	String	The brief description of the error.	4.1.0
details	String	The details about the error.	4.1.0
elaboration	String	The reserved field. Default value: null.	4.1.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.1.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.1.0

SDK Sample

Java SDK

```
GetPlatformTimeZoneAction action = new GetPlatformTimeZoneAction();
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetPlatformTimeZoneAction.Result res = action.call();
```

Python SDK

```
GetPlatformTimeZoneAction action = GetPlatformTimeZoneAction()
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetPlatformTimeZoneAction.Result res = action.call()
```

9.1.5 IsReadyToGo

API Request

URLs

```
GET zstack/v1/management-nodes/ready
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 61f9cb0129d749ebbd3d6052bfc759b2" \
```

```
-X GET http://localhost:8080/zstack/v1/management-nodes/ready?
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
managementNodeId	String	query	Optional.		0.6
systemTags	List	query	Optional. The system tags.		0.6
userTags	List	query	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "managementNodeId": "28ff5884cbf83d48b2e50203a5f2e636"
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6

Name	Type	Description	Starting Version
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

SDK Sample

Java SDK

```
IsReadyToGoAction action = new IsReadyToGoAction();
action.sessionId = "4feaf1772217415a876735801e468fac";
IsReadyToGoAction.Result res = action.call();
```

Python SDK

```
IsReadyToGoAction action = IsReadyToGoAction()
action.sessionId = "432b9a5c589c4c09b33b79d8272528be"
IsReadyToGoAction.Result res = action.call()
```

9.1.6 GetManagementNodeOS

API Request

URLs

```
PUT zstack/v1/management/actions
```

Body

```
{
  "getManagementNodeOS": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-X PUT -d '{"getManagementNodeOS:{}}' http://localhost:8080/zstack/
v1/management/actions
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
systemTags	List	query	Optional. The system tags.		4.1.0
userTags	List	query	Optional. The user tags.		4.1.0

API Response

Sample Response:

```
{
  "name": "Linux",
  "version": "5.4.0-33-generic"
}
```

Name	Type	Description	Starting Version
name	String	The resource name.	4.1.0
version	String		4.1.0
success	boolean		4.1.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.1.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.1.0

Name	Type	Description	Starting Version
description	String	The brief description of the error.	4.1.0
details	String	The details about the error.	4.1.0
elaboration	String	The reserved field. Default value: null.	4.1.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.1.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.1.0

SDK Sample

Java SDK

```
GetManagementNodeOSAction action = new GetManagementNodeOSAction();  
GetManagementNodeOSAction.Result res = action.call();
```

Python SDK

```
GetManagementNodeOSAction action = GetManagementNodeOSAction()  
GetManagementNodeOSAction.Result res = action.call()
```

9.1.7 GetManagementNodeArch

API Request

URLs

```
PUT zstack/v1/management-nodes/actions
```

Body

```
{  
  "getManagementNodeArch": {},  
  "systemTags": [],  
  "userTags": []  
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-X PUT -d '{"getManagementNodeArch":{}}' http://localhost:8080/zstack/
v1/management-nodes/actions
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
systemTags	List	query	Optional. The system tags.		4.1.0
userTags	List	query	Optional. The user tags.		4.1.0

API Response**Sample Response:**

```
{
  "architecture": "x86_64"
}
```

Name	Type	Description	Starting Version
name	String	The resource name.	4.1.0
version	String		4.1.0
success	boolean		4.1.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error	4.1.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.1.0
description	String	The brief description of the error.	4.1.0
details	String	The details about the error.	4.1.0
elaboration	String	The reserved field. Default value: null.	4.1.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.1.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.1.0

SDK Sample

Java SDK

```
GetManagementNodeArchAction action = new GetManagementNodeArchAction();
GetManagementNodeArchAction.Result res = action.call();
```

Python SDK

```
GetManagementNodeArchAction action = GetManagementNodeArchAction()
```

```
GetManagementNodeArchAction.Result res = action.call()
```

9.2 Progress Bar Operations

9.2.1 GetTaskProgress

API Request

URLs

```
GET zstack/v1/task-progresses/{apiId}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 8679db834cfc4b3b93fcbf8521581eff" \
-X GET http://localhost:8080/zstack/v1/task-progresses/7b016e3d2b4647e9abe3183728f77e57?all=false
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
apild	String	url	Optional. The API ID corresponded by the task.		1.11
all	boolean	query	Optional. Obtains all the progress information.		1.11
systemTags	List	query	Optional. The system tags.		1.11
userTags	List	query	Optional. The user tags.		1.11

API Response

Sample Response

```
{
  "inventories": [
```

```
{
  "taskUuid": "931102503f64436ea649939ff3957406",
  "taskName": "org.zstack.header.vm.APICreateVmInstanceMsg",
  "type": "Task",
  "content": "Choose backup storage for downloading the image",
  "time": 1.510669257141E12
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventories	List	See inventories .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventories

Name	Type	Description	Starting Version
taskUuid	String		0.6
taskName	String		0.6
parentUuid	String		0.6
type	String		0.6
content	String		0.6
opaque	LinkedHashMap		0.6
time	Long		0.6
totalSteps	Integer		0.6
currentStep	Integer		0.6
subTasks	List	See subTasks.	0.6

SDK Sample

Java SDK

```
GetTaskProgressAction action = new GetTaskProgressAction();
action.apiId = "00c035b586634edeb3bfb21f17e02b40";
action.all = false;
action.sessionId = "dea874a205c04a838e46ff6f48294add";
GetTaskProgressAction.Result res = action.call();
```

Python SDK

```
GetTaskProgressAction action = GetTaskProgressAction()
action.apiId = "82f5efb211394297b1d6a4f8d5e5618e"
action.all = false
action.sessionId = "2100b95ab4064c81acc5db473b2a1ef6"
```

```
GetTaskProgressAction.Result res = action.call()
```

9.3 Available Resource Query Operations

9.3.1 GetCpuMemoryCapacity

API Request

URLs

```
GET zstack/v1/hosts/capacities/cpu-memory
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/hosts/capacities/cpu-memory?
zoneUuids=6510dcd4e77939d695b035ecbcfb217c&zoneUuids=33a39cd9391538a4a4d45666e856
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
zoneUuids	List	query	Optional. The zone UUID list.		0.6
clusterUuids	List	query	Optional. The cluster UUID list used for attaching the network and the storage.		0.6
hostUuids	List	query	Optional. The host UUID list used for adding and deleting the host.		0.6
all	boolean	query	Optional. Default value: false.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
			- When false, at least one of the zone UUID, cluster UUID, or host UUID is required, or all are required. - When true, the zone UUID, cluster UUID, and host UUID are all optional.		
hypervisorType	String	query	Optional. The hypervisor type.	- KVM - ESC	0.6
systemTags	List	query	Optional. The system tags.		0.6
userTags	List	query	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "totalCpu": 4.0,
  "availableCpu": 2.0,
  "totalMemory": 8.0,
  "availableMemory": 4.0,
  "managedCpuNum": 4.0,
  "capacityData": [
    {
      "resourceUuid": "db558260b0b53e36aa8ebf7e40c7c9c6",
      "totalCpu": 4.0,
      "availableCpu": 2.0,
      "totalMemory": 8.0,
      "availableMemory": 4.0,
      "managedCpuNum": 4.0
    }
  ]
}
```

```

    }
  ],
  "resourceType": "HostV0"
}

```

Name	Type	Description	Starting Version
totalCpu	long	The total CPU count.	0.6
availableCpu	long	The available CPU count.	0.6
totalMemory	long	The total memory.	0.6
availableMemory	long	The available memory.	0.6
managedCpuNum	long	The number of managed host CPUs.	2.5.0
resourceType	String	The type of queried resources, such as the host, cluster, and zone.	3.9.0
success	boolean	Whether the API succeeds.	0.6
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
capacityData	List	See capacityData .	3.9.0
error	ErrorCode	See error .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6

Name	Type	Description	Starting Version
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#capacityData

Name	Type	Description	Starting Version
resourceUuid	String	The resource UUID.	3.9.0
totalCpu	long	The total CPU count.	3.9.0
availableCpu	long	The available CPU count.	3.9.0
totalMemory	long	The total memory.	3.9.0
availableMemory	long	The available memory.	3.9.0
managedCpuNum	long	The number of managed host CPUs.	3.9.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6

Name	Type	Description	Starting Version
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

SDK Sample

Java SDK

```
GetCpuMemoryCapacityAction action = new GetCpuMemoryCapacityAction();
action.zoneUuids = asList("79383afd88f54a0b994515d84dbfa447", "
907c8ca71ee440e3bb0327f19d60754a");
action.clusterUuids = asList("9f5431123b834d95ae642c3cb923ba32", "
09cdcc7e28f340ccace7c427a32e2c05");
action.hostUuids = asList("2926839176934652ac3c6a77e4ce1484", "

action.hypervisorType = "KVM";
action.all = true;
action.sessionId = "f3aedb623b3c47a7bb215ea3f4be90d7";
GetCpuMemoryCapacityAction.Result res = action.call();
```

Python SDK

```
GetCpuMemoryCapacityAction action = GetCpuMemoryCapacityAction()
action.zoneUuids = [28cd4ea55a72429d815205b0738b87b3, 2571613b0b
a642b7a1c99ddc17aee8e3]
action.clusterUuids = [3e9e56c96fa545fea0b759cb601aad1c, 98ec43d31a
f446a9bf290b117af95e52]
action.hostUuids = [b5cf96f88a1943f89417d6bea0715b6c, b358d13ac1
5049a581e47c76183c1358]
action.hypervisorType = "KVM"
action.all = true
action.sessionId = "b0b7e398d33d4d7893255547d0859731"
```

```
GetCpuMemoryCapacityAction.Result res = action.call()
```

9.4 Garbage Collection Operations

9.4.1 TriggerGCJob

API Request

URLs

```
PUT zstack/v1/gc-jobs/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "triggerGCJob": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"triggerGCJob":{}}' \
http://localhost:8080/zstack/v1/gc-jobs/1450275537b53cfeba9e6ac79ebadb16/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
TriggerGCJobAction action = new TriggerGCJobAction();
action.uuid = "ff4eb99f62364bcab4cbcebe4dea7de7";
action.sessionId = "7a51dbf52d5d41b0a877491143b6937a";
TriggerGCJobAction.Result res = action.call();
```

Python SDK

```
TriggerGCJobAction action = TriggerGCJobAction()
action.uuid = "a1d1ab14128e4f7398924591915ac65c"
action.sessionId = "6dcc50cb3dc5401b8ce03540a225f623"
TriggerGCJobAction.Result res = action.call()
```

9.4.2 DeleteGCJob

API Request

URLs

```
DELETE zstack/v1/gc-jobs/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth ea06449412a24699955ea802430000f3" \
-X DELETE http://localhost:8080/zstack/v1/gc-jobs/3a5d968dd8d743c280888a4973ea71d5
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteGCJobAction action = new DeleteGCJobAction();
action.uuid = "6bac0ebceac44a198609b0019c40a8eb";
action.sessionId = "78e46c7bfe0249fe9613223642222085";
DeleteGCJobAction.Result res = action.call();
```

Python SDK

```
DeleteGCJobAction action = DeleteGCJobAction()
action.uuid = "42db77385ebf4768bf105011ec8e6aaf"
action.sessionId = "331167c4de264088862128e5043c5a93"
DeleteGCJobAction.Result res = action.call()
```

9.4.3 QueryGCJob

API Request

URLs

```
GET zstack/v1/gc-jobs
```

```
GET zstack/v1/gc-jobs/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 8a590138fd064e5b8747e9fa75dd6c63" \
-X GET http://localhost:8080/zstack/v1/gc-jobs?
q=name=gc&q=state=Enabled
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 68ab95870cb4460fb9c82360f9ed64b2" \
-X GET http://localhost:8080/zstack/v1/gc-jobs/
b41ea820e0bd47d5a028ddb3eb10bb98
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryGCJob**, and pressing the Tab key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "uuid": "c7606f2ed20b4212aa3d1ce4e00acc1c",
      "name": "TestGC",

status	String		0.6
management NodeUuid	String		0.6
type	String		0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6

SDK Sample

Java SDK

```
QueryGCJobAction action = new QueryGCJobAction();
action.conditions = asList("name=gc", "state=Enabled");
action.sessionId = "3b403b588a96471cbee74a19d4a846aa";
QueryGCJobAction.Result res = action.call();
```

Python SDK

```
QueryGCJobAction action = QueryGCJobAction()
action.conditions = ["name=gc", "state=Enabled"]
action.sessionId = "76af9b84c87f4dcf9aa8f9042a982a6b"
QueryGCJobAction.Result res = action.call()
```

9.5 License Operations

9.5.1 GetLicenseInfo

API Request

URLs

```
GET zstack/v1/licenses
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-X GET http://localhost:8080/zstack/v1/licenses?
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
additionSession	String	query	Optional. The additional information. The value is a JSON-formatted string.		4.1.0
systemTags	List	query	Optional. The system tags.		0.6
userTags	List	query	Optional. The user tags.		0.6

- ZStack Cloud allows you to obtain the ID of the Cloud by adding the **platformId** option to **SystemTags**.
 - Format of the **platformId** option: `platformId::{%s}`. {%s} represents the first 10 digits of the md5 value calculated using the request key of the Cloud.
 - Example: `platformId::a95d3ee34r`

API Response

Sample Response

```
{
  "inventory": {
    "licenseType": "Free",
    "licenseRequest": "example request",
    "issuedDate": "2017-01-19 14:31:06",

expiredDate	String		0.6
issuedDate	String		0.6
user	String		0.6
prodInfo	String	The license product name.	4.1.0
hostNum	Integer		0.6
cpuNum	Integer		0.6
availableHostNum	Integer		0.6
availableCpuNum	Integer		0.6
expired	boolean		0.6

SDK Sample

Java SDK

```
GetLicenseInfoAction action = new GetLicenseInfoAction();
GetLicenseInfoAction.Result res = action.call();
```

Python SDK

```
GetLicenseInfoAction action = GetLicenseInfoAction()
```

```
GetLicenseInfoAction.Result res = action.call()
```

9.5.2 GetLicenseRecords

API Request

URLs

```
GET zstack/v1/licenses/records
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-X GET http://localhost:8080/zstack/v1/licenses/records?
limit=20.0&start=0.0&replyWithCount=true&count=false&sortBy=uploadDate&sortDirect
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
limit	Integer	query	Optional. The maximum number of records that cab be retrieved . Default: 20. This parameter is similar to the limit parameter in MySQL.		4.1.0
start	Integer	query	Optional. The position to start a query. You need to set this parameter if you specify thelimit parameter. This parameter is similar to		4.1.0

Name	Type	Location	Description	Valid Value	Starting Version
			the offset parameter in MySQL.		
replyWithCount	boolean	query	Optional. Specifies whether to return the number of records. If you set the value to true , the number of records are returned.		4.1.0
count	boolean	query	Optional. Specifies whether to count the number of records that meet the specified conditions. This parameter is similar to the count() function. If you set the value to true , the number of records that meet the specified conditions is calculated and returned.		4.1.0
sortBy	String	query	Optional. Specifies to start records		4.1.0

Name	Type	Location	Description	Valid Value	Starting Version
			by a key, for example sortBy=ip. You need to specify the sortDirection parameter if you specify this parameter. This parameter is similar to the sort by parameter in MySQL.		
sortDirection	String	query	Optional. The sort direction. You need to set this parameter if you specify the sortBy parameter.		4.1.0
systemTags	List	query	Optional. The system tags.		4.1.0
userTags	List	query	Optional. The user tags.		4.1.0

API Response

Sample Response

```
{
  "inventories": [
    {
      "user": "example",
      "hostNum": 10.0,
      "licenseType": "Free",
      "issuedDate": "2017-01-19 14:31:06",
      "managementNodeUuid": "00898b3538e53e70bb7521e54ff80276",
      "expired": true
    }
  ]
}
```

```

    ],
    "total": 1.0
  }

```

Name	Type	Description	Starting Version
total	Long	The total number of historic license authorizations. This parameter is returned if you set count or replyWithCount to true .	4.1.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error	4.1.0
inventory	LicenseInventory	See inventory	4.1.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	4.1.0
description	String	The brief description of the error.	4.1.0
details	String	The details about the error.	4.1.0
elaboration	String	The reserved field. Default value: null.	4.1.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.1.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error	4.1.0

Name	Type	Description	Starting Version
		exists, this parameter is null.	

#inventory

Name	Type	Description	Starting Version
uuid	String		4.1.0
licenseType	String		4.1.0
expiredDate	String		4.1.0
issuedDate	String		4.1.0
uploadDate	String	The license update time.	4.1.0
user	String		4.1.0
prodInfo	String	The license product name.	4.1.0
hostNum	Integer		4.1.0
cpuNum	Integer		4.1.0
vmNum	Integer		4.1.0
expired	boolean		4.1.0
management NodeUuid	String		4.1.0

SDK Sample

Java SDK

```

GetLicenseRecordsAction action = new GetLicenseRecordsAction();
action.limit = 20.0;
action.start = 0.0;
action.replyWithCount = true;
action.count = false;
action.sortBy = "uploadDate";
action.sortDirection = "desc";
GetLicenseRecordsAction.Result res = action.call();

```

Python SDK

```

GetLicenseRecordsAction action = GetLicenseRecordsAction()
action.limit = 20.0
action.start = 0.0
action.replyWithCount = true

```

```
action.count = false
action.sortBy = "uploadDate"
action.sortDirection = "desc"
GetLicenseRecordsAction.Result res = action.call()
```

9.5.3 GetLicenseCapabilities

API Request

URLs

```
GET zstack/v1/licenses/capabilities
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/licenses/capabilities
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	query	Optional. The system tags.		0.6
userTags	List	query	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
GetLicenseCapabilitiesAction action = new GetLicenseCapabilitiesAction();
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetLicenseCapabilitiesAction.Result res = action.call();
```

Python SDK

```
GetLicenseCapabilitiesAction action = GetLicenseCapabilitiesAction()
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetLicenseCapabilitiesAction.Result res = action.call()
```

9.5.4 GetLicenseUKeyStatus

API Request

URLs

```
POST zstack/v1/licenses/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{}}' http://localhost:8080/zstack/v1/licenses/
actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	query	Optional. The system tags.		
userTags	List	query	Optional. The user tags.		

API Response

Sample Response

```
{
  "inventories": [
    {
      "managementNodeUuid": "7fc6f9f3d112462fad5c60ae6bc14dd1",
      "status": "Ready",
      "keyId": "0123456789abcdef"
    }
  ]
}
```

Name	Type	Description	Starting Version
success	boolean		4.7.0
inventories	List	See inventories .	4.7.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.7.0

#inventories

Name	Type	Description	Starting Version
managementNodeUuid	String		4.7.0
keyId	String		4.7.0
status	UKeyStatus	See status .	4.7.0

#status

Name	Type	Description	Starting Version
Ready	UKeyStatus		4.7.0

Name	Type	Description	Starting Version
Missing	UKeyStatus		4.7.0
Fault	UKeyStatus		4.7.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.7.0
description	String	The brief description of the error.	4.7.0
details	String	The details about the error.	4.7.0
elaboration	String	The reserved field. Default value: null.	4.7.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.7.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.7.0

SDK Sample

Java SDK

```
GetLicenseUKeyStatusAction action = new GetLicenseUKeyStatusAction();
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetLicenseUKeyStatusAction.Result res = action.call();
```

Python SDK

```
GetLicenseUKeyStatusAction action = GetLicenseUKeyStatusAction()
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
GetLicenseUKeyStatusAction.Result res = action.call()
```

9.5.5 DeleteLicense

API Request

URLs

```
DELETE /v1/licenses/mn/{managementNodeUuid}/actions?uuid={uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/licenses/
mn/4a1821df62404868ada349c672e79a5b/actions?
uuid=jh34g5uy4g5434i5h45ui93457348
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	Optional. The resource UUID.		0.6
managementNodeUuid	String	url	The management node UUID.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
}
```

SDK Sample

Java SDK

```
DeleteLicenseAction action = new DeleteLicenseAction();
action.managementNodeUuid = "a762967a15a14d69833002d91119c493";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteLicenseAction.Result res = action.call();
```

Python SDK

```
DeleteLicenseAction action = DeleteLicenseAction()
action.managementNodeUuid = "32875f270bfc4bdb842ede0b42ed39a3"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteLicenseAction.Result res = action.call()
```

9.5.6 ReloadLicense

API Request

URLs

```
PUT zstack/v1/licenses/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "reloadLicense": {
    "managementNodeUuids": [
      "839034e1da8e37a08b67e3a8279a1650",
      "7869acf9b8bd34079f14a93751e60810"
    ]
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X PUT -d '{"reloadLicense":{"managementNodeUuids":
["839034e1da8e37a08b67e3a8279a1650","7869acf9b8bd34079f14a93751e60810"]}}'
\
http://localhost:8080/zstack/v1/licenses/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
managementNodeUuid	List	body (contained in the reloadLicense structure)	Optional. The management node UUID.		0.6
systemTag	List	body	Optional. The system tags.		0.6
userTag	List	body	Optional. The user tags.		0.6

SDK Sample

Java SDK

```
ReloadLicenseAction action = new ReloadLicenseAction();
action.managementNodeUuids = asList("839034e1da8e37a08b67e3a8279a1650",
    "7869acf9b8bd34079f14a93751e60810");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
ReloadLicenseAction.Result res = action.call();
```

Python SDK

```
ReloadLicenseAction action = ReloadLicenseAction()
action.managementNodeUuids = [839034e1da8e37a08b67e3a8279a1650,
7869acf9b8bd34079f14a93751e60810]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
ReloadLicenseAction.Result res = action.call()
```

9.5.7 UpdateLicense

API Request

URLs

```
PUT zstack/v1/licenses/mn/{managementNodeId}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateLicense": {
    "license": "this is license string"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateLicense":{"license":"this is license string"}}' \
http://localhost:8080/zstack/v1/licenses/mn/
f03b0d69643038f9812edbf4b259cac1/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
management NodeUuid	String	url	The management node UUID.		0.6
license	String	body (contained in the updateLicense structure)	The license content encoded in Base64 format.		0.6
additionalSession	String	body (contained in the updateLicense structure)	The additional information. The value is a JSON-formatted string.		4.1.0
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

availableCpuNum	Integer		0.6
expired	boolean		0.6

SDK Sample

Java SDK

```
UpdateLicenseAction action = new UpdateLicenseAction();
action.managementNodeUuid = "f03b0d69643038f9812edbf4b259cac1";
action.license = "this is license string";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateLicenseAction.Result res = action.call();
```

Python SDK

```
UpdateLicenseAction action = UpdateLicenseAction()
action.managementNodeUuid = "f03b0d69643038f9812edbf4b259cac1"
action.license = "this is license string"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateLicenseAction.Result res = action.call()
```

9.5.8 PushLicenseAddOnsUsage

API Request

URLs

```
PUT zstack/v1/licenses/addons/usage
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "pushLicenseAddOnsUsage": {
    "addOnsUsage": "[{\"usage\":10,\"module\": \"CPU.Zaku\"}]"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X PUT -d '{"pushLicenseAddOnsUsage":{"addOnsUsage":[{"usage":10,"module":"CPU.Zaku"}]}}' http://localhost:8080/zstack/v1/licenses/addons/usage
```

Request Parameters

Name	Type	Location	Description	Valid Values	Starting Version
addOnsUsage	String	body (contained in the pushLicenseAddOnsUsage structure)	The utilization of each add-on module.		5.1.8
systemTags	List	body	Optional. The system tags.		5.1.8
userTags	List	body	Optional. The user tags.		5.1.8

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK示例

Java SDK

```
PushLicenseAddOnsUsageAction action = new PushLicenseAddOnsUsageAction();
action.addOnsUsage = "[{"usage":10,"module":"CPU.Zaku"}]";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
PushLicenseAddOnsUsageAction.Result res = action.call();
```

Python SDK

```
PushLicenseAddOnsUsageAction action = PushLicenseAddOnsUsageAction()
action.addOnsUsage = "[{"usage":10,"module":"CPU.Zaku"}]"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
PushLicenseAddOnsUsageAction.Result res = action.call()
```

9.6 Long Job Operations

9.6.1 SubmitLongJob

API Request

URLs

```
POST zstack/v1/longjobs
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "migrate-volume",
    "description": "migrate volume to another Ceph primary storage",
    "jobName": "APIPrimaryStorageMigrateVolumeMsg",
    "jobData": "{\"volumeUuid\":\"45a53d3d93384433add8ead7616586cf\",
    \"dstPrimaryStorageUuid\":\"70a0618804864b3dabe8be9824c8028c\"}",
    "targetResourceUuid": "45a53d3d93384433add8ead7616586cf"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"name":"migrate-
volume","description":"migrate volume to another Ceph primary
storage","jobName":"APIPrimaryStorageMigrateVolumeMsg","jobData":{"volumeUuid
\":\"45a53d3d93384433add8ead7616586cf\",
\"dstPrimaryStorageUuid\":\"70a0618804864b3dabe8be9824c8028c
\"},"targetResourceUuid":"45a53d3d93384433add8ead7616586cf"}}' \
http://localhost:8080/zstack/v1/longjobs
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	Optional. The resource name.		2.3
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		2.3
jobName	String	body (contained in the params structure)	The job name.		2.3
jobData	String	body (contained in the params structure)	The job data.		2.3
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		2.3
systemTags	List	body	Optional. The system tags.		2.3
userTags	List	body	Optional. The user tags.		2.3
targetResourceUuid	String	body (contained in the params structure)	Optional. The UUID of the target resource.		2.3

- ZStack Cloud allows you to mark a **longjob** that uploads a specific image by using the `systemTags` parameter. You can set the value of the **systemTags** parameter to **uploadImage**. The **IMAGE_ID** that you specify is generally a MD5 value.
 - The format of the option is `uploadImage : { IMAGE_ID }`.
 - For example, `uploadImage : 68b329da9893e34099c7d8ad5cb9c940`.

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "23598186b9ef35aa89fbeb8f04d497a"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.3
inventory	LongJobInventory	See inventory .	2.3

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	2.3
description	String	The brief description of the error.	2.3
details	String	The details about the error.	2.3
elaboration	String	The reserved field. Default value: null.	2.3
opaque	LinkedHashMap	The reserved field. Default value: null.	2.3
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	2.3

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	2.3
name	String	The resource name.	2.3
description	String	The detailed description of the resource.	2.3
apild	String	The API ID used to associate with the task progress.	2.3
jobName	String	The job name.	2.3
jobData	String	The job data.	2.3
jobResult	String	The job result.	2.3
targetResourceUuid	String	The target resource UUID.	2.3
managementNodeUuid	String	The management node UUID.	2.3
createDate	Timestamp	The creation date.	2.3
lastOpDate	Timestamp	The last operation date.	2.3
state	LongJobState	See state .	2.3

#state

Name	Type	Description	Starting Version
name	String	The resource name.	2.3
ordinal	int		2.3

SDK Sample

Java SDK

```
SubmitLongJobAction action = new SubmitLongJobAction();
action.name = "migrate-volume";
action.description = "migrate volume to another Ceph primary storage";
action.jobName = "APIPrimaryStorageMigrateVolumeMsg";
action.jobData = "{\"volumeUuid\":\"45a53d3d93384433add8ead7616586cf\", \"dstPrimaryStorageUuid\":\"70a0618804864b3dabe8be9824c8028c\"}";
action.targetResourceUuid = "45a53d3d93384433add8ead7616586cf";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
SubmitLongJobAction.Result res = action.call();
```

Python SDK

```
SubmitLongJobAction action = SubmitLongJobAction()
action.name = "migrate-volume"
action.description = "migrate volume to another Ceph primary storage"
action.jobName = "APIPrimaryStorageMigrateVolumeMsg"
action.jobData = "{\"volumeUuid\":\"45a53d3d93384433add8ead7616586cf\", \"dstPrimaryStorageUuid\":\"70a0618804864b3dabe8be9824c8028c\"}"
action.targetResourceUuid = "45a53d3d93384433add8ead7616586cf"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
SubmitLongJobAction.Result res = action.call()
```

9.6.2 UpdateLongJob

API Request

URLs

```
PUT zstack/v1/longjobs/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateLongJob": {
    "name": "new-name",
    "description": "new-description"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateLongJob":{"name":"new-name","description":"new-description"}}' http://localhost:8080/zstack/v1/longjobs/dee3e1e3706f3e52a2cb9a47850508e7/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.9.0
name	String	body (contained in the updateLong Job structure)	Optional. The resource name.		3.9.0
description	String	body (contained in the updateLong Job structure)	Optional. The detailed description of the resource.		3.9.0
systemTags	List	body	Optional. The system tags.		3.9.0
userTags	List	body	Optional. The user tags.		3.9.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "464cdf695427358696dae171544b67ef",
    "name": "new-name",
    "description": "new-description"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.9.0
inventory	LongJobInventory	See inventory .	3.9.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	3.9.0
description	String	The brief description of the error.	3.9.0
details	String	The details about the error.	3.9.0
elaboration	String	The reserved field. Default value: null.	3.9.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.9.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.9.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.9.0
name	String	The resource name.	3.9.0
description	String	The detailed description of the resource.	3.9.0
apild	String	The API ID used to associate with the task progress.	3.9.0
jobName	String	The job name.	3.9.0
jobData	String	The job data.	3.9.0
jobResult	String	The job result.	3.9.0
targetResourceUuid	String	The UUID of the target resource.	3.9.0

Name	Type	Description	Starting Version
management NodeUuid	String	The UUID of the management node.	3.9.0
createDate	Timestamp	The creation date.	3.9.0
lastOpDate	Timestamp	The last operation date.	3.9.0
state	LongJobState	See state .	3.9.0

#state

Name	Type	Description	Starting Version
Waiting	LongJobState		3.9.0
Suspended	LongJobState		3.9.0
Running	LongJobState		3.9.0
Succeeded	LongJobState		3.9.0
Canceling	LongJobState		3.9.0
Canceled	LongJobState		3.9.0
Failed	LongJobState		3.9.0

SDK Sample

Java SDK

```
UpdateLongJobAction action = new UpdateLongJobAction();
action.uuid = "dee3e1e3706f3e52a2cb9a47850508e7";
action.name = "new-name";
action.description = "new-description";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateLongJobAction.Result res = action.call();
```

Python SDK

```
UpdateLongJobAction action = UpdateLongJobAction()
action.uuid = "dee3e1e3706f3e52a2cb9a47850508e7"
action.name = "new-name"
action.description = "new-description"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
UpdateLongJobAction.Result res = action.call()
```

9.6.3 DeleteLongJob

API Request

URLs

```
DELETE zstack/v1/longjobs/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/longjobs/
a87ae356c6583cc7b312412337f96609?
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.3
systemTags	List	body	Optional. The system tags.		2.3
userTags	List	body	Optional. The user tags.		2.3

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DeleteLongJobAction action = new DeleteLongJobAction();
action.uuid = "a87ae356c6583cc7b312412337f96609";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteLongJobAction.Result res = action.call();
```

Python SDK

```
DeleteLongJobAction action = DeleteLongJobAction()
action.uuid = "a87ae356c6583cc7b312412337f96609"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteLongJobAction.Result res = action.call()
```

9.6.4 QueryLongJob

API Request

URLs

```
GET zstack/v1/longjobs
GET zstack/v1/longjobs/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json; charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/longjobs
```

```
curl -H "Content-Type: application/json; charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/longjobs/
f031e4ea64673a5f96e022f4eb81fc59
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryLongJob**, and pressing the Tab key.

API Response

Sample Response

```
{
```

```

"inventories": [
  {
    "uuid": "e8a3fcaa8c393684b78a6dc1b20db49f"
  }
]
}

```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.3
inventories	List	See inventories .	2.3

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	2.3
description	String	The brief description of the error.	2.3
details	String	The details about the error.	2.3
elaboration	String	The reserved field. Default value: null.	2.3
opaque	LinkedHashMap	The reserved field. Default value: null.	2.3
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	2.3

#inventories

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	2.3
name	String	The resource name.	2.3
description	String	The detailed description of the resource.	2.3
apild	String	The API ID used to associate with the task progress.	2.3
jobName	String	The job name.	2.3
jobData	String	The job data.	2.3
jobResult	String	The job result.	2.3
targetResourceUuid	String	The target resource UUID.	2.3
managementNodeUuid	String	The management node UUID.	2.3
createDate	Timestamp	The creation date.	2.3
lastOpDate	Timestamp	The last operation date.	2.3
state	LongJobState	See state .	2.3

#state

Name	Type	Description	Starting Version
name	String	The resource name.	2.3
ordinal	int		2.3

SDK Sample

Java SDK

```
QueryLongJobAction action = new QueryLongJobAction();
action.conditions = asList();
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryLongJobAction.Result res = action.call();
```

Python SDK

```
QueryLongJobAction action = QueryLongJobAction()
action.conditions = []
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
QueryLongJobAction.Result res = action.call()
```

9.7 System Error Code Operations

9.7.1 GetElaborations

API Request

URLs

```
GET zstack/v1/errorcode/elaborations
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \  
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \  
-X GET http://localhost:8080/zstack/v1/errorcode/elaborations?category=BS&regex=certificate has expired or is not yet valid
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
category	String	query	Optional. The error code category , which is consistent with resource or service category, such as HOST.		3.3.0
regex	String	query	Optional. The error code keyword.		3.3.0
code	String	query	Optional. The error code, which is used with the error code category.		3.6.0

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	query	Optional. The system tags.		3.3.0
userTags	List	query	Optional. The user tags.		3.3.0

API Response

Sample Response

```
{
  "contents": [
    {
      "category": "HOST",
      "code": "1003",
      "regex": "host[uuid:%s, name:%s] is in status[%s], cannot
perform required operation",
      "message_cn": "物理机正处于[停止]状态，不能进行该操作",
      "message_en": "Host is in status[Stopped], cannot perform
required operation",
      "source": "zstack",
      "method": "distance",
      "distance": 0.0
    }
  ]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.3.0
contents	List	See contents .	3.3.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	0.6

Name	Type	Description	Starting Version
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#contents

Name	Type	Description	Starting Version
category	String	The error code category.	3.3.0
code	String	The error code.	3.3.0
regex	String	The error code keyword.	3.3.0
message_cn	String	The error code message in Chinese.	3.3.0
message_en	String	The error code message in English.	3.3.0
source	String	The source of the error.	3.3.0
method	String	The matching method , including distance (string comparison) and regex (regular expression).	3.6.0
distance	Double	If you use distance to do the match, this parameter will be the	3.6.0

Name	Type	Description	Starting Version
		precision. Note: '1' is the best precision.	

SDK Sample

Java SDK

```
GetElaborationsAction action = new GetElaborationsAction();
action.category = "BS";
action.regex = "certificate has expired or is not yet valid";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetElaborationsAction.Result res = action.call();
```

Python SDK

```
GetElaborationsAction action = GetElaborationsAction()
action.category = "BS"
action.regex = "certificate has expired or is not yet valid"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetElaborationsAction.Result res = action.call()
```

9.7.2 GetElaborationCategories

API Request

URLs

```
GET zstack/v1/errorcode/elaborations/categories
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/errorcode/elaborations/
categories
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
systemTags	List	query	Optional. The system tags.		4.5.0

Name	Type	Location	Description	Valid Value	Starting Version
userTags	List	query	Optional. The user tags.		4.5.0

API Response

Sample Response

```
{
  "categories": [
    {
      "category": "ACCOUNT",
      "num": 5.0
    },
    {
      "category": "BS",
      "num": 3.0
    },
    {
      "category": "VM",
      "num": 20.0
    }
  ]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error	4.5.0
categories	List	For more information, see categories	4.5.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.5.0
description	String	The brief description of the error.	4.5.0

Name	Type	Description	Starting Version
details	String	The details about the error.	4.5.0
elaboration	String	The reserved field. Default value: null.	4.5.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.5.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.5.0

#categories

Name	Type	Description	Starting Version
category	String	The category name.	4.5.0
num	Integer	The count of the error codes under the category.	4.5.0

SDK示例

Java SDK

```
GetElaborationCategoriesAction action = new GetElaborationCategoriesAction();  
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";  
GetElaborationCategoriesAction.Result res = action.call();
```

Python SDK

```
GetElaborationCategoriesAction action = GetElaborationCategoriesAction()  
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
GetElaborationCategoriesAction.Result res = action.call()
```

9.8 Search Operations

9.8.1 RefreshSearchIndexes

API Request

URLs

```
GET zstack/v1/search/indexes/refresh
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/search/indexes/refresh
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
systemTags	List	query	Optional. The system tags.		4.0.0
userTags	List	query	Optional. The user tags.		4.0.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
RefreshSearchIndexesAction action = new RefreshSearchIndexesAction();
```

```
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";  
RefreshSearchIndexesAction.Result res = action.call();
```

Python SDK

```
RefreshSearchIndexesAction action = RefreshSearchIndexesAction()  
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"  
RefreshSearchIndexesAction.Result res = action.call()
```

Glossary

Instance

An instance is a virtual machine or server that runs the images of operating systems in Cloud, such as VM instance and elastic baremetal instance.

VM Instance

A VM instance is a virtual machine instance running on a host. A VM instance has its own IP address and can access public networks and run application services.

Volume

A volume provides storage space for a VM instance. Volumes are categorized into root volumes and data volumes.

Root Volume

A root volume provides support for the system operations of a VM instance.

Data Volume

A data volume provides extended storage space for a VM instance.

Image

An image is a template file used to create a VM instance or volume. Images are categorized into system images and volume images.

Instance Offering

An instance offering defines the number of vCPU cores, memory size, network bandwidth, and other configuration settings of VM instances.

Disk Offering

A disk offering defines the capacity and other configuration settings of volumes.

GPU Specification

A GPU specification defines the frame per second (FPS), video memory, resolution, and other configuration settings of a physical or virtual GPU. GPU specifications are categorized into physical GPU specifications and virtual GPU specifications.

vNUMA Configuration

vNUMA uses CPU pinning to passthrough the topology of associated host physical NUMA (pNUMA) nodes to a VM instance, generating a topology of virtual NUMA (vNUMA) nodes for the VM instance. This topology enables a vCPU on a vNUMA node to primarily access the local memory and thus improves VM performance.

NUMA (Non-Uniform Memory Access)

Non-uniform memory access (NUMA) is a computer memory design where the memory access time depends on the memory location relative to the CPU. Under NUMA, a processor can access its own local memory faster than non-local memory and thus improves VM performance.

pNUMA Node (physical NUMA Node)

A pNUMA node (physical NUMA node) is a host NUMA node predefined based on the host NUMA architecture. It is used to manage the CPUs and memory of the host.

pNUMA Topology (physical NUMA Topology)

A pNUMA topology (physical NUMA topology) is the topology of the host NUMA nodes predefined by the CPU vendor based on the host NUMA architecture.

vNUMA Node (virtual NUMA Node)

A vNUMA node (virtual NUMA node) is generated by passing-through associated pNUMA nodes via CPU pinning. It is used to manage the CPUs and memory of a VM instance.

vNUMA Topology (virtual NUMA Topology)

A vNUMA topology (virtual NUMA topology) is the topology of VM NUMA nodes generated by passing-through associated pNUMA nodes via CPU pinning.

Local Memory

Local memory is the memory that a CPU (pCPU or vCPU) accesses through the Uncore iMC (Integrated Memory Controller) of the same NUMA (pNUMA or vNUMA) node. Compared with accessing non-local memory, accessing local memory has lower latencies.

CPU Pinning

CPU pinning assigns the virtual CPUs (vCPUs) of a VM instance to specific physical CPUs (pCPUs) of the host, which improves VM performance.

EmulatorPin Configuration

EmulatorPin assigns all other threads than virtual CPU (vCPU) threads and IO threads of a VM instance to physical CPUs (pCPUs) of the host so that these threads run on assigned pCPUs.

Auto-Scaling Group

An auto-scaling group is a group of VM instances that are used for the same scenarios. An auto-scaling group can automatically scale out or in based on application workloads or health status of VM instances in the group.

Snapshot

A snapshot is a point-in-time capture of data status in a volume.

Affinity Group

A VM scheduling policy is a resource orchestration policy based on which VM instances are assigned hosts to achieve the high performance and high availability of businesses.

Zone

A zone is a logical group of resources such as clusters, L2 networks, and primary storage. Zone is the largest resource scope defined in the Cloud.

Cluster

A cluster is a logical group of hosts (compute nodes).

Host

A host provides compute, network, and storage resources for VM instances.

Primary Storage

A primary storage is one or more servers that store volume files of VM instances. These files include root volume snapshots, data volume snapshots, image caches, root volumes, and data volumes.

Image Storage

An image storage is a storage server that stores VM image templates, including ISO image files.

iSCSI Storage

iSCSI storage is an SAN storage that uses the iSCSI protocol for data transmission. You can add an iSCSI SAN block as a Shared Block primary storage or pass through the block to a VM instance.

FC Storage

FC storage is an SAN storage that uses the FC technology for data transmission. You can add an FC SAN block as a Shared Block primary storage or pass through the block to a VM instance.

NVMe Storage

A type of storage implemented via the NVMe-oF (NVMe over fabrics) protocol. You can add a block device configured from an NVMe storage as SharedBlock primary storage.

L2 Network

An L2 network is a layer 2 broadcast domain used for layer 2 isolation. Generally, L2 networks are identified by names of devices on the physical network.

VXLAN Pool

A VXLAN pool is a collection of VXLAN networks established based on VXLAN Tunnel Endpoints (VTEPs). The VNI of each VXLAN network in a VXLAN pool must be unique.

L3 Network

An L3 network includes IP ranges, gateway, DNS, and other network configurations that are used by VM instances.

Public Network

Generally, a public network is a logical network that is connected to the Internet. However, in an environment that has no access to the Internet, you can also create a public network.

Flat Network

A flat network is connected to the network where the host is located and has direct access to the Internet. VM instances in a flat network can access public networks by using elastic IP addresses.

VPC Network

A VPC network is a private network where VM instances can be created. A VM instance in a VPC network can access the Internet through a VPC vRouter.

Management Network

A management network is used to manage physical resources in the Cloud. For example, you can create a management network to manage access to hosts, primary storage, image storage, and VPC vRouters.

Flow Network

A flow network is a dedicated network for port mirror transmission. You can use a flow network to transmit the mirrors of data packets of NIC ports to the target ports.

VPC vRouter

A VPC vRouter is a dedicated VM instance that provides multiple network services.

VPC vRouter HA Group

A VPC vRouter HA group consists of two VPC vRouters. Either VPC vRouter can be a primary or secondary VPC vRouter for the group. If the primary VPC vRouter does not work as expected, the VPC vRouter becomes the secondary VPC vRouter in the group to ensure high availability of business.

vRouter Image

A vRouter image encapsulates network services and can be used to create VPC vRouters.

Dedicated-Performance LB Image

A dedicated-performance load balancer (LB) image encapsulates dedicated-performance load -balancing services and can be used to create load balancer instances. However, a dedicated-performance load balancer image cannot be used to create VM instances.

vRouter Offering

A vRouter offering defines the number of vCPU cores, memory size, image, management network , and public network configuration settings of VPC vRouters. You can use a vRouter offering to create VPC vRouters that can provide network services for public networks and VPC networks.

LB Instance Offering

A load balancer (LB) instance offering defines the CPU, memory, image, and management network configuration settings used to create LB instances. LB instances provide load balancing services for the public network, flat network, and VPC network.

SDN Controller

The SDN controller is the core of the SDN architecture, responsible for centralized management and control of network devices.

SDN Instance

A dedicated VM instance designed to provide SDN network capabilities.

SDN Image

An SDN image encapsulates an SDN software and can be used to create SDN instances.

SDN Instance Offering

An SDN instance offering defines the CPU, memory, SDN image, and management network configuration used for creating SDN instances.

Security Group

A security group provides security control services for VM NICs. It filters the ingress or egress TCP, UDP, and ICMP packets of VM NICs based on the specified security rules.

VIP

In bridged network environments, a virtual IP address (VIP) provides network services such as serving as an elastic IP address (EIP), port forwarding, load balancing, IPsec tunneling. When a VIP provides the preceding network services, packets are sent to the VIP and then routed to the destination network where VM instances are located.

EIP

An elastic IP address (EIP) functions based on the NAT technology. IP addresses in a private network are translated into an EIP that is in another network. This way, private networks can be accessed from other networks by using EIPs.

Port Forwarding

Port forwarding functions based on the layer-3 forwarding service of VPC vRouters. This service forwards traffic flows of the specified IP addresses and ports in a public network to specified ports of VM instances by using the specified protocol. If your public IP addresses are insufficient, you can configure port forwarding for multiple VM instances by using one public IP address and port.

Load Balancer

A load balancer distributes traffic flows of a virtual IP address to backend servers. It automatically inspects the availability of backend servers and isolates unavailable servers during traffic distribution. This way, the load balancer improves the availability and service capability of your business.

Listener

A listener monitors the frontend requests of a load balancer and distributes the requests to a backend server based on the specified policy. In addition, the listener performs health checks on backend servers.

Forwarding Rule

A forwarding rule forwards the requests from different domain names or URLs to different backend server groups.

Backend Server Group

A backend server group is a group of backend servers that handles requests distributed by load balancers. It is the basic unit for traffic distribution by load balancer instances.

Backend Server

A backend server handles requests distributed by a load balancer. You can add a VM instance on the Cloud or a server on a third-party cloud as a backend server.

Frontend Network

A frontend network is a type of network that is associated with a load balancer. Requests from the network are distributed by the load balancer to backend servers based on a specified policy.

Backend Network

A backend network is a type of network that is associated with a load balancer. Requests from frontend networks are distributed by the load balancer to servers in the backend network.

Load Balancer Instance

A load balancer instance is a custom VM instance used to provide load balancing services.

Certificate

If you select HTTPS for a listener, associate it with a certificate to make the listener take effect. You can upload either a certificate or certificate chain.

Firewall

A firewall is an access control policy that monitors ingress and egress traffic of VPC vRouters and decides whether to allow or block specific traffic based on the associated rule sets and rules.

Firewall Rule Set

A firewall rule set is a set of rules that a firewall uses to defend against network attacks. You need to associate a rule set with the egress or ingress flow direction of VPC vRouter NICs to make the rule set take effect.

Firewall Rule

A firewall rule is an access control entry associated with the egress or ingress flow direction of VPC vRouter NICs to defend against network attacks. A firewall rule includes rule priority, match condition, and behavior.

Rule Template

A rule template is a template that you can select when you add rules to a rule set or a firewall.

IP/Port Set

An IP or port set is a set of IP addresses or ports that you can select when you add rules to a rule set or a firewall.

IPsec Tunnel

An IPsec tunnel encrypts and verifies IP packets that transmit over a virtual private network (VPN) from one site to another.

OSPF Area

An Open Shortest Path First (OSPF) area is divided from an autonomous system based on the OSPF protocol. This simplifies the hierarchical management of vRouters.

NetFlow

A NetFlow monitors the ingress and egress traffic of the NICs of VPC vRouters. The supported versions of data flows are V5 and V9.

Port Mirroring

Port mirroring mirrors the traffic data of VM NICs and sends the traffic data to the target ports. This allows for the analysis of data packets of ports and simplifies the monitoring and management of data traffic and makes it easier to locate network errors and exceptions.

Route Table

A route table contains information about various routes that you configure. Route entries in a route table must include the destination network, next hop, and route priority.

CloudFormation

CloudFormation is a service that simplifies the management of cloud resources and automates deployment and O&S. You can create a stack template to configure cloud resources and their dependencies. This way, resources can be automatically configured and deployed in batches. CloudFormation provides easy management of the lifecycle of cloud resources and integrates automatic O&S into API and SDK.

Resource Stack

A resource stack is a stack of resources that are configured by using a stack template. The resources in the stack have dependencies with each other. You can manage resources in the stack by managing the resource stack.

Stack Template

A stack template is a UTF8-encoded file based on which you can create resource stacks. The stack template defines the resources that you want, the dependencies between the resources, and the configuration settings of the resources. When you use a stack template to create a resource stack, CloudFormation parses the template and the resources are automatically created and configured.

Sample Template

A sample template is a commonly used resource stack. You can use a sample template provided by the Cloud to create resource stacks.

Designer

A designer is a CloudFormation tool that allows you to orchestrate cloud resources. You can drag and drop resources on a canvas and use lines to establish dependencies between the resources.

Baremetal Cluster

A baremetal cluster consists of baremetal chassis. You can manage baremetal chassis by managing a baremetal cluster where the chassis reside.

Deployment Server

A deployment server is a server that provides PXE service and console proxy service for baremetal chassis.

Baremetal Chassis

A baremetal chassis is used to create a baremetal instance and is identified based on the BMC interface and IPMI configuration setting.

Preconfigured Template

A preconfigured template is used to create a preconfigured file that allows for unattended batch installation of an operating system for baremetal instances.

Baremetal Instance

A baremetal instance is an instantiated baremetal chassis.

Elastic Baremetal Management

Elastic Baremetal Management provides dedicated physical servers for your applications to ensure high performance and stability. In addition, this feature allows elastic scaling. You can apply for and scale resources based on your needs.

Provision Network

A provision network is a dedicated network for PXE boot and image downloads while creating elastic baremetal instances.

Elastic Baremetal Cluster

An elastic baremetal cluster consists of elastic baremetal instances. You can manage elastic baremetal instances by managing an elastic baremetal cluster where the instances reside.

Gateway Node

A gateway node is a node where the ingress and egress traffic of the Cloud and elastic baremetal instances is forwarded.

Baremetal Node

A baremetal node is used to create a baremetal instance and is identified based on the BMC interface and IPMI configuration setting.

Elastic Baremetal Instance

An elastic baremetal instance has the same performance as physical servers and allows elastic scaling. You can apply for and scale resources based on your needs.

Elastic Baremetal Offering

An elastic baremetal offering defines the number of vCPU cores, memory size, CPU architecture, CPU model, and other configuration settings of elastic baremetal instances.

vCenter

The Cloud allows you to take over vCenter and manage resources on the vCenter.

VM Instance

A VM instance is an ESXi virtual machine instance running on a host. A VM instance has its own IP address to access public networks and can run application services.

Network

A vCenter network defines the network settings of VM instances on vCenter, such as IP range, gateway, DNS, and network services.

Volume

A volume provides storage space for a VM instance on vCenter. A volume attached to a VM instance can be used as a root volume or data volume. A root volume provides support for the system operations of a VM instance. A data volume provides extended storage space for a VM instance.

Image

An image is a template file used to create a VM instance or volume on vCenter. Images are categorized into system images and volume images.

Event Message

Event Message displays event alarm messages of vCenter that is took over by the Cloud. This feature allows you to locate errors and exceptions efficiently.

Network Topology

A network topology visualizes the network architecture of the Cloud. It allows for efficient planning , management, and improvement of network architecture. Network topologies can be categorized into global topologies and custom topologies.

Performance Analysis

Performance Analysis displays the performance metrics of key resources monitored externally or internally in the Cloud. You can view the performance analysis or export the analysis report as needed to improve the O&M efficiency.

Capacity Management

Capacity Management visualizes the capacities and usages of key resources in the Cloud. You can use this feature to improve O&S efficiency.

MN Monitoring

Management Node (MN) monitoring allows you to view the health status of each management node when you use multiple management nodes to achieve high availability.

Alarm

An alarm is used to monitor the status of time-series data and events and respond to the status change. Alarms can be categorized into resource alarm, event alarm, and extended alarm.

One-Click Alarm

A one-click alarm integrates multiple metrics of a resource. You can create one-click alarms for multiple resources to monitor these resources.

Alarm Template

An alarm template is a template of alarm rules. If you associate an alarm template with a resource group, an alarm is created to monitor the resources in the group.

Resource Group

A resource group consists of resources grouped based on your business needs. If you associate an alarm template with a resource group, the alarm rules specified by the template take effect on all the resources in the group.

Message Template

A message template specifies the text template of a resource alarm message or event alarm message sent to an SNS system.

Message Source

A message source is used to take over extended alarm messages. If you configure alarms for message sources, extended alarm messages can be sent to various endpoints.

Endpoint

An endpoint is a method that users obtain subscribed messages. Endpoints are categorized into system endpoints, email, DingTalk, HTTP application, short message service, and Microsoft Teams.

Alarm Message

An alarm message is a message sent the time when an alarm is triggered.

Current Task

A current task is an ongoing operation performed in the Cloud. You can perform centralized management over ongoing operations.

Operation Log

An operation log is a chronological record of operations on the specified objects and their operation results.

Audit

Audit monitors and records all activities on the Cloud. You can use this feature to implement operation tracking, cybersecurity classified protection compliance, security analysis, troubleshooting, and automatic O&M.

Log Collection

Allows you to collect with one click the log data from the Cloud and various nodes on the Cloud generated in the specified time period and download the log data.

One-Click Inspection

Comprehensively inspects the health status of key resources and services of the Cloud and scores their healthiness based on the inspection results. In addition, the one-click inspection service provides O&M suggestions and inspection reports.

Backup Management

Backup management integrates multiple disaster recovery technologies such as incremental backup and full backup that are suitable for multiple business scenarios. You can implement local backup and remote backup based on your business needs.

Backup Job

You can create a backup job to back up local VM instances, volumes, or databases to a specified storage server on a regular basis.

Local Backup Data

Local backup data of VM instances, volumes, and databases is stored in the local backup server.

Local Backup Server

A local backup server is located at the local data center and is used to store local backup data.

Remote Backup Server

A remote backup server is located at a remote data center or a public cloud and is used to store remote backup data.

Continuous Data Protection (CDP)

Continuous Data Protection (CDP) provides second-level and fine-grained continuous backups for important business systems in VM instances, allowing users to restore VM data to a specific time state, and retrieve files without restoring the system.

CDP Task

You can create a CDP task to continuously back up your VM data to a specified backup server to achieve continuous data protection and recovery.

CDP Data

The backup data generated from continuous data protection on VM instances is stored in local backup servers.

Recovery Point

A recovery point is a data point generated during continuous data protection. A recovery point corresponds to a data record within the recovery point interval specified by the user.

Locked Recovery Point

You can lock or unlock a recovery point as needed. After a recovery point is locked, data of the recovery point will not be automatically cleared or deleted.

Recovery Task

A recovery task helps you quickly restore data by specifying a CDP task and recovery point, and allows you to view the recovery progress and logs in a more friendly way.

Cryptography Security Compliance

The Cryptography Security Compliance service provides applications with cloud security capabilities based on commercial cryptography, meeting the requirements of commercial cryptography application security assessments.

HSM Pool

An HSM pool is a logical group of hardware security modules (HSMs) and is used to provide unified cryptography services such as signature validation and encryption.

HSM

A hardware security module (HSM) is a dedicated device that encrypts, decrypts, and authenticates information by using the cryptographic technology.

Platform Cryptography Security Compliance

Enables the Cloud to meet the requirements of Cryptography Security Compliance through the cryptography capabilities provided by HSM pools.

Certificate Login

Authenticates the identity of a user by using a UKey device.

Data Protection

Protects important data on the Cloud to ensure the data confidentiality and integrity.

Scheduled Job

A scheduled job defines that a specific action be implemented at a specified time based on a scheduler.

Scheduler

A scheduler is used to schedule jobs. It is suitable for business scenarios that last for a long time.

Tag

A tag is used to mark resources. You can use a tag to search for and aggregate resources.

Migration Service

The Cloud provides V2V migration service that allows you to migrate VM instances and data from other virtualized platform to the current cloud platform.

V2V Migration

V2V Migration allows you to migrate VM instances from the VMware or KVM platform to the current cloud platform.

V2V Conversion Host

A V2V conversion host is a host in the destination cluster that you need to specify during V2V migration to cache VM instances and data when you implement V2V migration. After the VM instances and data are cached in the V2V conversion host, they are migrated to the destination primary storage.

User

A user is a natural person that constructs the most basic unit in Tenant Management.

User Group

A user group is a collection of natural persons or a collection of project members. You can use a user group to grant permissions.

Role

A role is a collection of permissions that can be granted to users. A user that assumes a role can call API operations based on the permissions specified by the role. Roles are categorized into platform roles and project roles.

Single Sign On

The Single Sign On service provided by the Cloud. It supports seamless access to SSO systems . Through the service, related users can directly log in to the Cloud and manage cloud resources. Currently, AD/LDAP/OIDC/OAuth2/CAS servers can be added.

Project

A project is a task that needs to be accomplished by specific personnel at a specified time. In Tenant Management, you can plan resources at the project granularity and allocate an independent resource pool to a project. The word **Tenant** in Tenant Management mainly refers to projects. A project is a tenant.

Project Member

A project member is a member in a project who is granted permissions on specific project resources and can use the resources to accomplish tasks. Project members include the project admin, project managers, and normal project members.

Process Management

Process management is part of ticket management that manages the processes related to the resources of projects. Processes can be categorized into default processes and custom processes .

My Approvals

In the Cloud, only the administrator and project administrators are granted approval permissions. the administrator and project administrators can approve or reject a ticket. If a ticket is approved, resources are automatically deployed and allocated to the specified project.

Bills

A bill is the expense of resources totaled at a specified time period. Billing is accurate to the second. Bills can be categorized into project bills, department bills, and account bills.

Pricing List

A pricing list is a list of unit prices of different resources. The unit price of a resource is set based on the specification and usage time of the resource.

Console Proxy

Console proxy allows you to log in to a VM instance by using the IP address of a proxy.

AccessKey Management

An AccessKey pair is a security credential that one party authorizes another party to call API operations and access its resources in the Cloud. AccessKey pairs shall be kept confidential.

IP Allowlist/Blocklist

An IP allowlist or blocklist identifies and filters IP addresses that access the Cloud. You can create an IP allowlist or blocklist to improve access control of the Cloud.

Application Center

Application Market allows you to add applications to the Cloud and then access the applications with one click. It extends the functionality of the Cloud. You can add default applications through the built-in installation package or add more applications through URLs.

Sub-Account Management

A sub-account can be created by the admin or synced from an SSO authentication system and is managed by the admin. Resources created under a sub-account are managed by the sub-account .

Theme and Appearance

You can customize the theme and appearance of the Cloud.

Email Server

If you select Email as the endpoint of an alarm, you need to set an email server. Then alarm messages are sent to the email server.

Log Server

A log server is used to collect management node logs or the platform operation logs. You can add a log server to the cloud and use the collected logs for operation trace or troubleshooting. This makes your O&M more efficient.

Global Setting

Global Setting allows you to configure settings that take effect on the whole platform.

Scenario Template

Scenario Template provides multiple templates that encapsulate scenario-based global settings . You can apply a template globally with one click based on your business needs. This improves your O&M efficiency.

HA Policy

HA Policy is a mechanism that ensures sustained and stable running of the business if VM instances are unexpectedly stopped or are errored because of errors occurring to compute, network, or storage resources associated with the VM instances. By enabling this feature, you can customize VM HA policies to ensure your business continuity and stability.

Time Management

Manages the Cloud system time and allows you to configure time servers for the Cloud. After you configure NTP time servers for the Cloud, the clock of the time servers is synced with all nodes of the Cloud.

GPU Device

A GPU device is a powerful microprocessor with high computational capabilities. You can use a GPU device to handle intricate graphics rendering and parallel computing jobs, thus improving the efficiency of businesses such as graphic production, video processing, and machine learning.

Script Library

The script library stores and manages script files centrally. By executing scripts on VM instances, you can complete complex O&M operations and automated jobs.

XML Hook

An XML Hook is a script that can flexibly insert or modify parameters in XML files of VM instances . By attaching an XML Hook to a VM instance, you can customize VM configurations and enable specialized functionalities.

Container Service

A simple and user-friendly container management service, providing features like GPU management & scheduling, multi-tenancy, multi-cluster, quota configuration, CI/CD. and microservice. The service reduces the container using complexity and aligns well with traditional

user's habits, helping you easily manage and deploy your container cluster, and enjoy the benefits of cloud-native technologies in a quick and convenient way.

Advanced Monitoring Server

An advanced monitoring server is a dedicated VM instance used to receive advanced monitoring data of load balancers and other resources.

Advanced Monitoring Server Image

An advanced monitoring server image encapsulates the advanced monitoring service and can be used to create advanced monitoring server.

Advanced Monitoring Server Offering

An advanced monitoring server offering defines the CPU cores, memory size, image, management network, and public network configurations of advanced monitoring server. You can use an advanced monitoring server offering to create advanced monitoring servers.

Plugin Management

You can package extended resources or tools into standardized plugins for quick installation and integration, expanding the Cloud capabilities.
