5.1.1.114 ExecuteGuestVmCommand.....	478
5.1.1.115 UploadFileToVm.....	485
5.1.2 Volume Operations.....	487
5.1.2.1 CreateDataVolume.....	487
5.1.2.2 DeleteDataVolume.....	491
5.1.2.3 ExpungeDataVolume.....	493
5.1.2.4 RecoverDataVolume.....	494
5.1.2.5 ChangeVolumeState.....	498
5.1.2.6 CreateDataVolumeFromVolumeTemplate.....	502
5.1.2.7 CreateDataVolumeFromVolumeSnapshot.....	506
5.1.2.8 QueryVolume.....	510
5.1.2.9 GetVolumeFormat.....	513
5.1.2.10 GetVolumeCapabilities.....	516
5.1.2.11 SyncVolumeSize.....	518
5.1.2.12 BatchSyncVolumeSize.....	521
5.1.2.13 ResizeRootVolume.....	523
5.1.2.14 ResizeDataVolume.....	527
5.1.2.15 UpdateVolume.....	531
5.1.2.16 SetVolumeQoS.....	535
5.1.2.17 GetVolumeQoS.....	538
5.1.2.18 DeleteVolumeQos.....	541
5.1.2.19 GetVolumeloThreadPin.....	543
5.1.2.20 SetVolumeloThreadPin.....	545
5.1.2.21 GetDataVolumeAttachableVm.....	549
5.1.2.22 AttachDataVolumeToVm.....	554
5.1.2.23 DetachDataVolumeFromVm.....	558
5.1.2.24 AttachDataVolumeToHost.....	561
5.1.2.25 DetachDataVolumeFromHost.....	563
5.1.2.26 CreateVolumeSnapshot.....	564
5.1.2.27 QueryVolumeSnapshot.....	568
5.1.2.28 QueryVolumeSnapshotTree.....	571
5.1.2.29 UpdateVolumeSnapshot.....	573
5.1.2.30 DeleteVolumeSnapshot.....	577
5.1.2.31 RevertVolumeFromSnapshot.....	578
5.1.2.32 GetVolumeSnapshotSize.....	580
5.1.2.33 ShrinkVolumeSnapshot.....	583
5.1.2.34 FlattenVolume.....	585

5.1.3 Image Operations.....	589
5.1.3.1 AddImage.....	589
5.1.3.2 DeleteImage.....	596
5.1.3.3 ExpungeImage.....	598
5.1.3.4 QueryImage.....	600
5.1.3.5 RecoverImage.....	601
5.1.3.6 ChangeImageState.....	606
5.1.3.7 UpdateImage.....	610
5.1.3.8 SyncImageSize.....	616
5.1.3.9 DeleteImagePackage.....	620
5.1.3.10 QueryImagePackage.....	621
5.1.3.11 UpdateImagePackage.....	624
5.1.3.12 GetCandidateBackupStorageForCreatingImage.....	628
5.1.3.13 CreateRootVolumeTemplateFromRootVolume.....	630
5.1.3.14 CreateRootVolumeTemplateFromVolumeSnapshot.....	636
5.1.3.15 CreateDataVolumeTemplateFromVolume.....	642
5.1.3.16 CreateDataVolumeTemplateFromVolumeSnapshot.....	648
5.1.3.17 GetImageQga.....	653
5.1.3.18 SetImageQga.....	655
5.1.3.19 SetImageBootMode.....	657
5.1.3.20 GetUploadImageJobDetails.....	659
5.1.3.21 CalculateImageHash.....	662
5.1.4 Affinity Group Operations.....	667
5.1.4.1 CreateAffinityGroup.....	667
5.1.4.2 DeleteAffinityGroup.....	671
5.1.4.3 QueryAffinityGroup.....	673
5.1.4.4 UpdateAffinityGroup.....	676
5.1.4.5 AddVmToAffinityGroup.....	680
5.1.4.6 RemoveVmFromAffinityGroup.....	684
5.1.4.7 ChangeAffinityGroupState.....	688
5.1.4.8 GetCandidateAffinityGroupForAttachingVm.....	691
5.1.4.9 GetCandidateVMForAttachingAffinityGroup.....	695
5.1.4.10 GetCandidateAffinityGroupForCreatingVm.....	701
5.1.5 VM Scheduling Rule Group Operations.....	704
5.1.5.1 CreateHostSchedulingRuleGroup.....	704
5.1.5.2 DeleteHostSchedulingRuleGroup.....	708
5.1.5.3 UpdateHostSchedulingRuleGroup.....	709
5.1.5.4 AddHostToHostSchedulingRuleGroup.....	712
5.1.5.5 DetachHostFromHostSchedulingRuleGroup.....	714
5.1.5.6 CreateVmSchedulingRuleGroup.....	715
5.1.5.7 DeleteVmSchedulingRuleGroup.....	719
5.1.5.8 UpdateVmSchedulingRuleGroup.....	720
5.1.5.9 AddVmToVmSchedulingRuleGroup.....	723
5.1.5.10 DetachVmFromVmSchedulingRuleGroup.....	725

5.1.5.11 GetVmSchedulingRulesExecuteState.....	726
5.1.5.12 CreateVmSchedulingRule.....	729
5.1.5.13 RemoveVmSchedulingRule.....	734
5.1.5.14 ChangeVmSchedulingRuleState.....	735
5.1.5.15 UpdateVmSchedulingRule.....	739

1 Introduction

Product Version

This documentation applies to ZStack Cloud 5.3.40.

Intended Audience

This documentation elaborates on the definitions of and how to use ZStack Cloud 5.3.40 RESTful API, and is intended for the following audiences:

- Architects
- Developmental engineers
- Test engineers
- Project implementation engineers
- People who are interested in
- People who are interested in ZStack Cloud

2 RESTful API Overview

ZStack Cloud 5.3.40 provides native RESTful supports. You can design principles and conventions by using the REST-defined framework, and use the HTTP-based programming language for further development.

2.1 HTTP Verbs

ZStack Cloud API allows you to perform operations on resources by using the following four HTTP verbs.

HTTP Verb	Description
GET	Obtains resource information. This verb is used by all query APIs and read APIs.
POST	Creates a resource.
PUT	Updates a resource. This verb is used to modify a resource, or perform RPC style calls, for example, start a VM instance.
DELETE	Deletes a resource.

2.2 Parameter Passing

URL, Query String, and HTTP Body can all be used to pass parameters. Each method can be used independently, or be used in conjunction with other methods. Note that the specific method is determined by the API you use.

URL Parameter Passing

When you operate on a specific resource, the resource UUID will be encoded and then passed to a URL.

For example, start a VM instance with the UUID *f97143d60f1042c9badd9a1336d3c105*. Then, the URL format is as follows:

```
zstack/v1/vm-instances/f97143d60f1042c9badd9a1336d3c105/actions
```

In the preceding sample, the UUID is encoded and passed to a URL.

Query String Parameter Passing

All APIs that use the HTTP GET verb pass parameters by using query strings.

For example, query all the VM instances that are in the running state. Then, the URL format is as follows:

```
zstack/v1/vm-instances?q=state=Running
```

HTTP Body Parameter Passing

When you create a resource by using the POST verb, or modify a resource by using the PUT verb, the rest of the parameters will be passed by using the HTTP body method apart for those passed by using a URL.

For example, start a VM instance on a specified host.

```
PUT zstack/v1/vm-instances/f97143d60f1042c9badd9a1336d3c105/actions
{
  "startVmInstance": {
    "hostUuid": "8aef7e3a53b34eedaa05027a919156d9"
  }
}
```

In the preceding sample, the UUID of the VM instance is passed by using a URL, while the **hostUuid** parameter is passed by using the HTTP body.

2.3 HTTP Headers

ZStack Cloud API uses the following custom HTTP headers.

Authorization

You need a session before you use all ZStack Cloud APIs, except for a few APIs such as login API. When you call an API, the session UUID will be passed by using the Authorization HTTP header. The header format is as follows:

```
Authorization: OAuth Session UUID
```

Example:

```
Authorization: OAuth 34cbfddd470a47d8bdb0727cd2182618
```

**Note:**

OAuth and the session UUID must be separated by using a space.

X-Job-UUID

If you use an asynchronous API, you can specify the API Job UUID by using the X-Job-UUID HTTP header. For example,

```
X-Job-UUID: d825b1a26f4e474b8c59306081920ff2
```

If an HTTP header is not specified, ZStack Cloud will automatically generate a UUID for API Job.

Note:

X-Job-UUID must be a version 4 UUID (a random UUID) without hyphens (-). ZStack Cloud will authenticate the validity of the X-Job-UUID format, and returns the 400 Bad Request error for invalid strings.

X-Web-Hook

If you use an asynchronous API, you can specify a callback URL by using the X-Web-Hook HTTP header to receive API responses. By using the callback URL method, the caller can avoid using the round-robin policy to query the results of an asynchronous API operation. For example,

```
X-Web-Hook: http://localhost:5000/api-callback
```

X-Job-Success

When you obtain the operation results of an asynchronous API by using the X-Web-Hook callback method, ZStack Cloud will include the X-Job-Success HTTP header to the HTTP Post request send to the callback URL. The X-Job-Success HTTP header indicates whether the API operation succeeds or not. For example,

```
X-Job-Success: true
```

If the value is *true*, the operation succeeds, or vice versa.

2.4 HTTP Status Code

The following table lists the status codes used by ZStack Cloud .

HTTP Status Code	Description
200	The API operation has succeeded.

HTTP Status Code	Description
202	The API request has been accepted by ZStack Cloud, and you need to obtain the API result by using the round-robin policy or webhook. The status code only appears when you call an asynchronous API.
400	The API request does not include the required parameter, or includes an invalid parameter. The detailed information can be obtained from the HTTP response body.
404	The correct URL was not found, which usually because a wrong API URL is specified. If the URL that you access is the round-robin address returned by the asynchronous API, the round-robin address has expired.
405	The API call uses a wrong HTTP method. For example, when you create a resource, you might mistakenly used the GET method instead of the POST method.
500	The ZStack Cloud RESTful terminal has encountered an internal error.
503	The API operation incurred an error. For example, you cannot create a VM instance because of the resource shortage. The detailed error information can be obtained from the HTTP response body.

2.5 API Type

ZStack Cloud API includes the following two types of APIs.

Synchronous API

APIs that use the GET method are all synchronous APIs, and includes API results in HTTP response received by callers. For example,

```
GET zstack/v1/zones/f3fa7671894a40f6a73f5bfc7d90c126

{
  "inventory": {
    "uuid": "f3fa7671894a40f6a73f5bfc7d90c126",
    "name": "zone1",
    "description": "test",
    "state": "Enabled",
    "type": "zstack",
    "createDate": "Jan 6, 2017 3:51:16 AM",
    "lastOpDate": "Jan 6, 2017 3:51:16 AM"
  }
}
```

```
}
```

Asynchronous API

Apart from the login APIs, all APIs that do not use the GET method are asynchronous APIs. After you successfully called an asynchronous API, you will receive a 202 status code and a round-robin address and timeout period (the location and apiTimeout fields) contained in Body. The unit of the apiTimeout field value is milliseconds. In addition, by using the GET method, you need to periodically request the round-robin address to obtain API operation results. For example,

```
Status Code: 202
Body:
{
    "apiTimeout": 43200000
    "location": "http://localhost:8989/v1/api-jobs/967a26b7431c49c0b1d5
0d709ef1aef3"
}
```

Normally, when you request a round-robin address by using the GET method, you can obtain the following four types of responses:

1. 202 status code: indicates that the API is still being processed, and you need to continuously use the round-robin policy.
2. 200 status code: indicates that the API operation succeeded, and the API result is contained in Body.
3. 503 status code: indicates that the API operation failed, and the error code is contained in Body.
4. 404 status code: indicates that the round-robin address has expired. That means that you probably access a wrong round-robin address, or the round-robin address is deleted because you have not accessed the round-robin address for a long time (for example, 2 days).

If you use an asynchronous API, you can also obtain the operation results by using webhook. The detailed usage can be seen in the following topics or sections.

2.6 API Operation

Similar to all RESTful APIs, most of ZStack Cloud APIs can perform create, read, update, and delete (CRUD) operations and remote procedure call (RPC) style operations.

Create Resource

To create resources, use the POST method. The parameters are passed by using the HTTP body. The following is an example of creating a VM instance:

```
POST zstack/v1/vm-instances

Authorization: OAuth 0c234e29a2ad4ff4b0d97d4f3b47c6cf

{
  "params": {
    "l3NetworkUuids": ["37a701c7fe4a40758da15593aedd8aff"],
    "defaultL3NetworkUuid": "37a701c7fe4a40758da15593aedd8aff",
    "dataDiskOfferingUuids": [],
    "name": "TestVm",
    "description": "Test",
    "systemTags": [],
    "instanceOfferingUuid": "dd53f94b58924510b0122e40799a4114",
    "type": "UserVm",
    "imageUuid": "cc7b56780879409f98c1f992b75a12b0"
  }
}
```

Query Resource

To query resources, use the GET method. The query conditions are passed by using a query string. The following is an example of querying the VM instances whose name is **not equal** to *web-vm* in the *cluster1*:

```
GET zstack/v1/vm-instances?condition=name!=web-vm&condition=cluster.name=cluster1

Authorization: OAuth 0c234e29a2ad4ff4b0d97d4f3b47c6cf
```

If you already know the resource UUID and want to obtain directly the resource information, use directly the GET method without adding any query condition. For example,

```
GET zstack/v1/vm-instances/56f0fd314a2647ffb4f9565f6d05858e

Authorization: OAuth 0c234e29a2ad4ff4b0d97d4f3b47c6cf
```

This sample above returns information about the VM instance whose UUID is *56f0fd314a2647ffb4f9565f6d05858e*.

Delete Resource

To delete resources, use the DELETE method. The UUID of the deleted resource is encoded in a URL. For example,

```
DELETE zstack/v1/vm-instances/56f0fd314a2647ffb4f9565f6d05858e
```

```
Authorization: OAuth 0c234e29a2ad4ff4b0d97d4f3b47c6cf
```

This sample above deletes the VM instance whose UUID is *56f0fd314a2647ffb4f9565f6d05858e*.

Change Resource and Perform RPC-Style Operation

Due to the nature of IaaS businesses, a portion of operations, such as starting a VM instance, are more similar to RPC operations instead of CRUD operations. According to some best practices of RESTful APIs, ZStack Cloud will categorize all these operations into sub-resources of operations. For example, when you start VM instances, or stop VM instances, you are performing operations on the sub-resources.

Start a VM instance:

```
PUT zstack/v1/vm-instances/d46841bd4ebd47f8bf0bed85c3bdf0db/actions
{
  "startVmInstance": {}
}
```

Stop a VM instance:

```
PUT zstack/v1/vm-instances/d46841bd4ebd47f8bf0bed85c3bdf0db/actions
{
  "stopVmInstance": {}
}
```

In the preceding samples, both operations access the same URL */v1/vminstances/d46841bd4ebd47f8bf0bed85c3bdf0db/actions*, and the specific operation types are indicated by the field name contained in Body. For example, if the stopVmInstance API contains additional parameters, these parameters are contained in the map to which the operation field name corresponds.

For more information about the specific field names of resource operations and examples, refer to detailed topics of each ZStack Cloud API.

2.7 Basic Workflow

In the following example, we will create a zone to describe the basic workflow for using the RESTful API.

Log In

The first step to use APIs is to log in to your account to obtain a session UUID for subsequent API calls.

```
PUT zstack/v1/accounts/login
```

```
body:
{
  "loginByAccount": {
    "password":
    "b109f3bbbc244eb82441917ed06d618b9008dd09b3befd1b5e07394c706a8bb980b1d7785e5976e"
    "accountName": "admin"
  }
}
```

In the preceding sample, the account password is the result generated by SHA-512.

The API response is as follows:

```
status code: 200
body:
{
  "inventory": {
    "uuid": "00d038b699b74e76a01705918d48d939",
    "accountUuid": "36c27e8ff05c4780bf6d2fa65700f22e",
    "userUuid": "36c27e8ff05c4780bf6d2fa65700f22e",
    "expiredDate": "Jan 1, 2017 11:31:06 AM",
    "createDate": "Jan 1, 2017 9:31:06 AM"
  }
}
```

The response content contains the account UUID and other fields. The session UUID that you need is contained in the **uuid** field: *00d038b699b74e76a01705918d48d939*.

Create Zone

```
POST zstack/v1/zones
headers:
Authorization: OAuth 00d038b699b74e76a01705918d48d939
body:
{
  "params": {
    "name": "Zone1",
    "description": "Test"
  }
}
```

The CreateZone API is an asynchronous API. Therefore, the API response is a round-robin address and a timeout period instead of a direct result. For example,

```
status code: 202
body:
{
  "apiTimeout":1800000
}
```

```
"location": "http://localhost:8080/v1/api-jobs/d0345d3ddc
ae485f8170572b15a2b581"
}
```

You need to obtain API results periodically by using the round-robin policy. For example,

```
GET http://localhost:8989/v1/api-jobs/d0345d3ddcae485f8170572b15a2b581
Authorization: OAuth 00d038b699b74e76a01705918d48d939
```

If the API operation does not complete, the preceding GET operation still obtains a 202 status code and the round-robin address. After the API operation succeeded, you will get the following result:

```
status code: 200
body:
{
  "inventory": {
    "uuid": "f52fe55b64094ceb99b3893a238c4931",
    "name": "Zone1",
    "description": "Test",
    "state": "Enabled",
    "type": "zstack",
    "createDate": "Jan 1, 2017 9:31:07 AM",
    "lastOpDate": "Jan 1, 2017 9:31:07 AM"
  }
}
```

Query Zone

You can use the GET method to obtain the information about the zone you created. For example,

```
GET zstack/v1/zones/f52fe55b64094ceb99b3893a238c4931
Authorization: OAuth 00d038b699b74e76a01705918d48d939
```

The response is as follows:

```
status code: 200
body:
{
  "inventory": {
    "uuid": "f52fe55b64094ceb99b3893a238c4931",
    "name": "Zone1",
    "description": "Test",
    "state": "Enabled",
    "type": "zstack",
    "createDate": "Jan 1, 2017 9:31:07 AM",
    "lastOpDate": "Jan 1, 2017 9:31:07 AM"
  }
}
```

```
}
```

Log Out

When all API calls are completed, you need to log out the session. For example,

```
DELETE zstack/v1/accounts/sessions/00d038b699b74e76a01705918d48d939
```

The response is as follows:

```
status code: 200
```

2.8 Webhook

Using the round-robin policy to query the operation results of asynchronous APIs is inefficient. In this regard, zstack provides the webhook method to actively send API results to callers.

To use the webhook feature, you only need to specify X-Job-UUID and X-Web-Hook in the HTTP headers. In the preceding example of creating a zone, the version of the API that use the webhook method is as follows:

```
POST zstack/v1/zones

headers:

Authorization: OAuth 00d038b699b74e76a01705918d48d939
X-Job-UUID: d0345d3ddcae485f8170572b15a2b581
X-Web-Hook: http://127.0.0.1:8989/rest-webhook

body:
{
  "params": {
    "name": "Zone1",
    "description": "Test"
  }
}
```

The API response is still a 202 status code and a round-robin address. However, you do not need to use the round-robin policy again. After the API operation succeeded, the result will be sent to: `http://127.0.0.1:8989/rest-webhook`

```
POST http://127.0.0.1:8989/rest-webhook

headers:

X-Job-Success: true
X-Job-UUID: d0345d3ddcae485f8170572b15a2b581

body:
{
  "inventory": {
```

```

    "uuid": "f52fe55b64094ceb99b3893a238c4931",
    "name": "Zone1",
    "description": "Test",
    "state": "Enabled",
    "type": "zstack",
    "createDate": "Jan 1, 2017 9:31:07 AM",
    "lastOpDate": "Jan 1, 2017 9:31:07 AM"
  }
}

```

In the result above, X-Job-Success indicates whether the API operation succeeds. In addition, the value contained in X-Job-UUID is the same as that of X-Job-UUID when you call APIs. Note that you can compare the result with the API.

2.9 Query API

You can query a resource by using the GET method. Similar to MySQL, you can specify multiple query conditions and the order method, or select fields and perform cross-table query.

ZStack Cloud supports more than 4 million query conditions as well as factorial of 4 million combinations of conditions.

Single Table Query

Query the VM instance whose name is *vm1*. For example,

```
GET zstack/v1/vm-instances?q=name=vm1
```

Query the VM instance whose name is *vm1* and is in the *Running* state. For example,

```
GET zstack/v1/vm-instances?q=name=vm1&q=state=Running
```

These two samples are about querying the VM resource itself, which belongs to the single table query in the database level.

Cross-Table Query

You can perform cross-table queries by using the `.` delimiter. The following are two examples:

Query the VM instance whose IP address is *192.168.10.100*. The cross-table query is performed for the VM instance table and the NIC table.

```
GET zstack/v1/vm-instances?q=vmNics.ip=192.168.10.100
```

Query all the VM instances that are running on the *10.10.20.3* IP address. The cross-table query is performed for the VM instance table and the host table.

```
GET zstack/v1/vm-instances?q=host.managementIp=10.10.20.3
```

Query API Parameters

Name	Type	Location	Description	Optional Value	Starting Version
q	List	query	Optional. The query condition. For more information, see Query Condition . If omitted, all records will be returned. The number of returned records is subject to the limit field.		0.6
limit	Integer	query	Optional. The maximum number of returned records. This field is equivalent to the limit field of MySQL. Default value: 1000.		0.6
start	Integer	query	Optional. The first record to query. This field is equivalent to the offset field of MySQL. You can perform paginated query by using both the start and limit fields.		0.6
count	Boolean	query	Optional. The count query. This field is equivalent to the count() function of MySQL. If true, the API only returns the number of records that meet the query condition.		0.6
groupBy	String	query	Optional. Groups rows into subgroups based on values of columns or expressions. This field is equivalent to the Group By clause in MySQL, such as groupBy=type.		1.9
replyWithCount	Boolean	query	Optional. If true, the query response returns both the records and the record count. Default value: false.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
			For more information, see Paginated Query .		
sort	String	query	Optional. The sort field, which is equivalent to the sortBy keyword of MySQL. This field must be used with '+' or '-' followed by the sort field name. Note that '+' means sort ascending, while '-' means sort descending. For example, - sort=+key: sorts ascending according to the key - sort=-key: sorts descending according to the key	'+' field name, '-' field name	0.6
fields	List	query	Optional. The returned fields. This field is equivalent to the select field of MySQL. For example, if fields=name,uuid, only names and UUIDs that meet the query conditions are returned.		0.6

Query Condition

The query conditions of ZStack Cloud query API are similar to the MySQL database.

For example,

```
uuid=bfa67f956afb430890aa49db14b85153
totalCapacity>2000
vmInstanceUuid not null
```

Note:

- Any space must not be contained between the field name, query operator, and match value.
- For example, `uuid = 25506342d1384c07b7342373a57475b9` is a wrong query condition. The correct format is `uuid=25506342d1384c07b7342373a57475b9`.

The relations among multiple query conditions are and. ZStack Cloud supports the following 10 query operators:

1. **=**: Equal. For example,

```
vmInstanceId=c4981689088b40f98d2ade2548c323da
```

2. **!=**: Not equal. For example,

```
vmInstanceId!=c4981689088b40f98d2ade2548c323da
```

3. **>**: Greater than.

4. **<**: Less than.

5. **>=**: Greater than or equal.

6. **<=**: Less than or equal.

7. **?= in** operator. This operator is used to check whether a value is within a set of values. Values in the set are separated by using commas (,). For example, check whether *uuid* is within a set of values.

```
uuid?=25506342d1384c07b7342373a57475b9, bc58d68090ac42358c0c  
b0fe72e3287f
```

8. **!= not in** operator. This operator is used to check whether a value is **not within** a set of values. Values in the set are separated by using commas (,). For example, check whether *name* is not equal to VM1 and VM2.

```
name!=VM1, VM2
```

9. **~=**: Simple pattern matching, which is similar to the **like** operation in MySQL. Use **%** to match any number of characters, even zero characters. Use **_** to match exactly one character. For example, query a name that starts with *IntelCore*.

```
name~=IntelCore%
```

10. Or query a name that starts with *IntelCore* and ends with *7*. A character will be fuzzily matched between *IntelCore* and *7*.

```
name~=IntelCore_7
```

Here, names with *IntelCoreI7* and *IntelCoreM7* will be matched.

11. **!~=**: Negation of simple pattern matching. This operator is used to query a field that cannot be matched by using simple pattern matching. In addition, the match condition is the same as that of **~=**.

12.is null: Checks whether a value is NULL.

```
name=null
```

13.not null: Checks whether a value is not NULL.

```
name!=null
```

Paginated Query

start, **limit**, and **replyWithCount** can all be used in conjunction to achieve paginated queries.

- **start:** Specifies the first record to query.
- **limit:** Specifies maximum number of returned records.
- **replyWithCount:** If true, the query response returns both the records and the record count that meet the query condition. You can know how many times of paginated queries are required by comparing this field with the **start** field.

For example,

If a total of 1000 records meet the query condition, you can use the following combination:

```
start=0 limit=100 replyWithCount=true
```

Then, the API response will contain the first 100 records, and the total field is equal to 1000, indicating that a total number of 1000 records meet the query condition.

Obtaining Query Fields of a Resource

We support a large number of query conditions. The query conditions listed in this documentation are only a part of them.

You can check the queryable fields of a resource and the fields that can be queried across tables by using the autocomplete feature of `zstack-cli`.

- For example, to query a VM instance, enter `QueryVmInstance` in `zstack-cli`, and complete the rest of the fields by pressing the **Tab** key. Then, you can see the following prompt page:

```
- >>>QueryVmInstance
[Query Conditions:]
allVolumes.          cluster.          host.
  image.             instanceOffering.  rootVolume.
vmNics.              zone.

__systemTag__=      __userTag__=      allocatorStrategy=
clusterUuid=        cpuNum=           cpuSpeed=
createDate=         defaultL3NetworkUuid=  description=
groupBy=            hostUuid=         hypervisorType=
```

imageUuid= lastOpDate= platform= type= uuid=	instanceOfferingUuid= memorySize= rootVolumeUuid= zoneUuid=	lastHostUuid= name= state=
[Parameters:]		
count= replyWithCount= start=	fields= sortBy= timeout=	limit= sortDirection=

- Information in the middle rows is displayed as follows:

__systemTag__= clusterUuid= createDate= groupBy= imageUuid= lastOpDate= platform= type= uuid=	__userTag__= cpuNum= defaultL3NetworkUuid= hostUuid= instanceOfferingUuid= memorySize= rootVolumeUuid= zoneUuid=	allocatorStrategy= cpuSpeed= description= hypervisorType= lastHostUuid= name= state=

Except for both **__systemTag__** and **__userTag__**, the rest are all native fields in the VM table. You can specify them in the API query condition, and specify these fields in **fields** to filter other fields that you do not want the API to return. For example,

```
GET zstack/v1/vm-instances?q=cpuNum>5
```

The sample above returns the VM instances whose CPU number is larger than 5.

```
GET zstack/v1/vm-instances?  
q=hypervisorType=KVM&fields=uuid&fields=name
```

The sample above returns the VM instances whose hypervisor type is KVM. The API response will only contain the name and UUID of the KVM instances, because both **uuid** and **name** are specified in **fields**.

Note:

Only native fields of resources are selected by **fields**. **__userTag__**, **__systemTag__**, and the following cross-table fields cannot appear in **fields**.

- The first prompt row indicates which VM resources can be queried across tables with other resources. For example,

allVolumes. image.	cluster. instanceOffering.	host. rootVolume.

```
vmNics.                zone.
```

In the sample above, **allVolumes** means all volumes, **cluster** means the cluster, and **vmNics** means the VM NICs.

If you need to check the specific fields of these resources, enter the resource name followed by a period (.), and complete the rest of the fields by pressing the **Tab** key.

For example,

```
- >>>QueryVmInstance vmNics.
[Query Conditions:]
vmNics.eip.                vmNics.l3Network.                vmNics
.loadBalancerListener.    vmNics.portForwarding.            vmNics.
securityGroup.
vmNics.vmInstance.

vmNics.__systemTag__=      vmNics.__userTag__=      vmNics.
createDate=                vmNics.deviceId=            vmNics.gateway=
vmNics.ip=                  vmNics.l3NetworkUuid=    vmNics.
lastOpDate=                vmNics.mac=              vmNics.metaData
=
vmNics.netmask=            vmNics.uuid=            vmNics.
vmInstanceUuid=
```

In the sample above, we entered the **vmNics** resource followed by a period (.) to indicate that a cross-table query will be performed. Pressing the **Tab** key completes the rest native fields of **vmNics** and other resources that can be queried cross tables.

- **vmNics.ip** means the **ip** native field of a NIC.

```
GET zstack/v1/vm-instances?q=vmNics.ip=192.168.0.100
```

In the sample above, we performed a cross-table query by using the **ip** field of the NIC table as the query condition. In the response, the VM instance whose IP address is *192.168.0.100* is returned.

- Similarly, the NIC resource can be queried across tables with other resources, such as **vmNics.eip**.

For example, you can perform query across the NIC table and the EIP table.

```
GET zstack/v1/vm-instances?q=vmNics.eip.ip=192.168.0.100
```

In the sample above, the query is performed across 3 tables. In the response, the VM instance whose EIP is *192.168.0.100* is returned.

- The cross-table query allows you to perform query across resources that are logically related in the system. For example,

```
- >>>QueryVmInstance zone.cluster.l2Network.l3Network.
[Query Conditions:]
zone.cluster.l2Network.l3Network.ipRanges.           zone.cluster
.l2Network.l3Network.l2Network.           zone.cluster.l2Network.
l3Network.networkServices.
zone.cluster.l2Network.l3Network.serviceProvider.   zone.cluster
.l2Network.l3Network.vNic.           zone.cluster.l2Network.
l3Network.zone.

zone.cluster.l2Network.l3Network.__systemTag__=       zone.cluster
.l2Network.l3Network.__userTag__=           zone.cluster.l2Network.
l3Network.createDate=
zone.cluster.l2Network.l3Network.description=         zone.cluster
.l2Network.l3Network.dnsDomain=           zone.cluster.l2Network.
l3Network.l2NetworkUuid=
zone.cluster.l2Network.l3Network.lastOpDate=           zone.cluster
.l2Network.l3Network.name=           zone.cluster.l2Network.
l3Network.state=
zone.cluster.l2Network.l3Network.system=           zone.cluster
.l2Network.l3Network.type=           zone.cluster.l2Network.
l3Network.uuid=
zone.cluster.l2Network.l3Network.zoneUuid=
```

In the sample above, the query is performed across the tables of **zone**, **cluster**, **L2 network**, and **L3 network**.

Note:

- Since a resource logic has a loop, the loop path can be created. For example, assume that the VM instance is a query body, and can be queried across tables, such as using `QueryVmInstance vmNics..` Meanwhile, assume that the NIC is also a query body, and can be queried across tables with the VM instance, such as using `QueryVmNic vmInstance..` Hence, a loop path is created.
- You must avoid performing the cross-table query for the loop. For example, use `QueryVmInstance vmNics.vmInstance.name=vm1` to perform the cross-table query for the VM instance of name=vm1. In fact, it is totally equal to using `QueryVmInstance name=vm1`. This is meaningless, because it will only generate complex SQL statements, which will lead to inefficient database queries.
- Both `__systemTag__` and `__userTag__` are special query conditions, allowing you to query resources by using a tag.

For example, you can query a VM instance that has the *staticIp:10.10.1.20* tag.

```
QueryVmInstance __systemTag__=staticIp:10.10.1.20
```

2.10 Changing API Service Port

Assume that you need to change an API service port. For example, to change the original API service port 8080 to the API service port 8989, follow the following steps:

1. Go to */usr/local/zstacktest/apache-tomcat/webapps/zstack/WEB-INF/classes/zstack.properties*, and configure the following parameters in the **zstack.properties** configuration file:

```
CloudBus.httpPort = 8989
RESTFacade.port = 8989
```

2. Go to */usr/local/zstacktest/apache-tomcat-8.5.35/conf/server.xml*, and change port 8080 to port 8989 in the **server.xml** configuration file of **tomcat**.
3. Run the following command to change the management node port to 8989:

```
zstack-ctl config_ui --mn-port 8989
```

4. Restart the management node and UI.

```
zstack-ctl stop
zstack-ctl start
```

5. Specify the port to 8989 when you are using **zstack-cli**.

```
zstack-cli --port 8989
```

Note:

The configured API service port must be in the valid range, and must not be in conflict with the API service port occupied by ZStack Cloud.

2.11 Batch API Response

Batch API responses can be classified into two categories: responses of long jobs and responses of non-long jobs.

Non-Long Job API Response

For error responses of non-long jobs, the value of the `success` field in the first layer is `true`. The value of the `success` field in inner layers vary depending on the sub-task result. If a sub-task

succeeded, `success=true` is returned. Otherwise, `success=false` is returned. The following shows a sample response of the `APIBatchDeleteVolumeSnapshotMsg` operation:

Error Response:

```
{
  "results": [
    {
      "error": {
        "code": "VOLUME_SNAPSHOT.1000",
        "description": "Snapshot is not in correct status for operation.",
        "details": "snapshot[uuid:e9c43724c6614aa488b63d6b33e30ebd, name:test1]'s status[Ready] is not allowed for message[org.zstack.header.storage.snapshot.VolumeSnapshotDeletionMsg], allowed status[Ready, Creating, Deleting]"
      },
      "snapshotUuid": "e9c43724c6614aa488b63d6b33e30ebd",
      "success": false
    },
    {
      "error": {
        "code": "VOLUME_SNAPSHOT.1000",
        "description": "Snapshot is not in correct status for operation.",
        "details": "snapshot[uuid:e9c43724c6614aa488b63d6b33e30ebd, name:test2]'s status[Ready] is not allowed for message[org.zstack.header.storage.snapshot.VolumeSnapshotDeletionMsg], allowed status[Ready, Creating, Deleting]"
      },
      "snapshotUuid": "63daa66726b24f9390216b8edf32190d",
      "success": false
    }
  ],
  "success": true
}
```

Successful Response:

```
{
  "results": [
    {
      "snapshotUuid": "1c8408e0f05d4fc39465d7db27d6bc32",
      "success": true
    },
    {
      "snapshotUuid": "e071e0ec42de4323bff23993a6a236d2",
      "success": true
    }
  ],
  "success": true
}
```

Long Job API Response

For error responses of long jobs, the value of the `success` field in the first layer is `true`. The value of the `success` field in inner layers vary depending on the sub-task result. If a sub-task

succeeded, `success=true` is returned. Otherwise, `success=false` is returned. The following shows a sample response of the `APIAddHostFromConfigFileMsg` operation:

Error Response:

```
{
  "results": [
    {
      "error": {
        "code": "SYS.1006",
        "cost": "5ms",
        "description": "An operation failed",
        "details": "the host[10.0.231.23] ssh port[22] not
open after 300 seconds, connect timeout",
        "elaboration": "错误信息: 物理机[10.0.231.23]的ssh端口[22]
在 300 秒内未开放, 连接超时",
        "location": "HostManagerImpl.java: send-connect-host-
message (location:2/4)"
      },
      "ip": "10.0.231.23",
      "success": false
    },
    {
      "error": {
        "code": "SYS.1007",
        "description": "One or more API argument is invalid",
        "details": "已经存在一个管理IP是[10.0.93.160]的物理机"
      },
      "ip": "10.0.93.160",
      "success": false
    }
  ],
  "success": true
}
```

Successful Response:

```
{
  "results": [
    {
      "ip": "10.0.231.231",
      "success": true
    },
    {
      "ip": "10.0.93.160",
      "success": true
    }
  ],
  "success": true
}
```

Conclusion

- The value of the `success` field in the first layer of the two categories of API responses is `true`.
- The value of the `success` field in the first layer indicates the result of a Restful API request. If the request succeeds, the value of the `success` field is `true`.

- The value of the `successfield` in the inner layers indicates the result of a sub-task of a Restful API request. If a sub-task succeeds, `success=true` is returned for the sub-task. Otherwise, `success=false` is returned for the sub-task.

**Note:**

API responses displayed on the UI may be modified. For example, the `successCount` and `failCount` fields may be added to the API response.

3 SDK Overview

ZStack Cloud provides Java SDK and Python SDK supports. To use the corresponding features, call ZStack Cloud APIs by using the SDK method.

To call ZStack Cloud APIs by using the SDK method, pay attention to the following issues:

- Java SDK compatible version: Java 8.
- Python SDK compatible version: Python 2.7.
- Format of `sdk_dataformat`: YY-MM-DD hh:mm:ss, such as 2019-03-08 19:23:00.

3.1 Environment Preparation

Before you use Java SDK or Python SDK, prepare the following software tools:

Java

- **Java Development Tool (IntelliJ IDEA)**

According to your own usage, download and install the appropriate Java development tool, such as IntelliJ IDEA and Eclipse, and complete the initialization job. This topic uses IntelliJ IDEA as an example.

- **Java JDK Tool**

Install the Java JDK tool in advance. We recommend that you use Java JDK 8.

- **ZStack Cloud Java SDK JAR Dependency Package**

Before you use the ZStack Cloud SDK, obtain the Java SDK JAR dependency package in advance. The package is stored in ZStack Cloud Installation Package.

- ZStack Cloud Installation Package:
 - Software: ZStack-Cloud-installer-5.3.40.bin
 - Download address: [Click here](#)
- Java SDK Dependency Package
 - File name: sdk-5.3.40.jar.
 - Storage path: `/usr/local/zstack/apache-tomcat/webapps/zstack/WEB-INF/lib/sdk-5.3.40.jar`.
- **Third-Party JAR Depended by SDK**

The detailed information about the JAR dependency package is as follows:

```
<dependencies>
```

```

<dependency>
  <groupId>org.zstack</groupId>
  <artifactId>sdk</artifactId>
  <version>3.4.0</version>
</dependency>
<dependency>
  <groupId>com.squareup.okhttp3</groupId>
  <artifactId>okhttp</artifactId>
  <version>3.5.0</version>
</dependency>
<dependency>
  <groupId>com.google.code.gson</groupId>
  <artifactId>gson</artifactId>
  <version>2.1</version>
</dependency>
<dependency>
  <groupId>commons-beanutils</groupId>
  <artifactId>commons-beanutils</artifactId>
  <version>1.9.3</version>
</dependency>
<dependency>
  <groupId>javax.servlet</groupId>
  <artifactId>servlet-api</artifactId>
  <version>2.5</version>
  <scope>provided</scope>
</dependency>
<dependency>
  <groupId>commons-codec</groupId>
  <artifactId>commons-codec</artifactId>
  <version>1.9</version>
</dependency>
</dependencies>

```

Python

1. Use either of the following methods to prepare a ZStack Cloud environment:

- Install an ZStack Cloud environment to the server to be used as the management node.
 - ZStack Cloud installation package:
 - Software: ZStack-Cloud-installer-5.3.40.bin
 - Download address: [Click here](#)
- Use the local PC to create a temporary virtual environment directory, for example, `/var/lib/virtualenv` and then execute the following command to copy an existing ZStack Cloud environment directory `/var/lib/zstack/virtualenv/zstackcli` to the newly created directory:

```
scp -r /var/lib/zstack/virtualenv/zstackcli $LocalHostIP:$VirtualDirectory //LocalHostIP is the IP address of the local PC
and VirtualDirectory is the directory created in the local PC.
```

Note:

Make sure that the local PC is connected to the management node and is installed Python 2.

2. Enable ZStack-CloudCLI tool to call Python SDK:

- If you use the management node, run the following command:

```
source /var/lib/zstack/virtualenv/zstackcli/bin/activate
```

- If you use the local PC, run the following command:

```
source $VirtualDirectory/zstackcli/bin/activate //VirtualDirectory  
is the directory created in the local PC.
```

3. Specify the IP address of the management node:

- If you use the management node, run the following command:

```
export ZS_SERVER_IP=127.0.0.1
```

- If you use the local PC, run the following command:

```
export ZS_SERVER_IP=MN_IP //MN_IP is the IP address of the  
management node.
```

3.2 SDK Use

After the preparations are completed, refer to the following procedure to use ZStack Cloud SDK:

Java

1. Create a JAVA Maven project on IDEA, as shown in [JAVA Maven Project](#).

Figure 3-1: JAVA Maven Project

2. Add the SDK JAR dependency package to the External Libraries project, and add the third-party package to the pom.xml file, as shown in [Add Dependency Package](#).

Figure 3-2: Add Dependency Package

3. Refer to SDK samples in API Reference to call APIs.

Python

- Using Python SDK to call APIs does not require the preceding preparations and dependencies like that of Java SDK. You can directly refer the SDK samples in API Reference.

3.3 SDK Usage Sample

This topic takes the query of a VM instance as an example to describe the usage of ZStack Cloud Java SDK and Python SDK.

Use Java SDK to query VM instances

The following is the query script:

```
package org.zstack;

import org.zstack.sdk.*;
import java.math.BigInteger;
import java.security.MessageDigest;
import java.security.NoSuchAlgorithmException;
import java.util.List;
import java.io.UnsupportedEncodingException;
```

```

/**
 * Display how to use zstack Java SDK to check a VM list.*/
public class ZStackSDKDemo {
    public static void main(String[] args) {
        String zstackServerHostname = "Enter the IP address of zstack
management node.";
        String accountName = "Enter zstack account.";
        String password = "Enter zstack account password.";

        ZSClient.configure(
            new ZSConfig.Builder()
                .setHostname(zstackServerHostname)
                .setPort(8080)
                .setContextPath("zstack")
                .build()
        );

        String sessionId = getSessionByLoginAccount(accountName,
password);

        QueryVmInstanceAction action = new QueryVmInstanceAction();
        action.sessionId = sessionId;
        QueryVmInstanceAction.Result result = action.call();
        result.throwExceptionIfError();

        List<VmInstanceInventory> vmList =
result.value.getInventories();
        System.out.println(String.format("QueryVmInstanceAction action
succeeded, and %s VM instances are detected.",
            vmList != null ? vmList.size() : 0));
    }

    private static String getSessionByLoginAccount(String accountName,
String password) {
        LogInByAccountAction action = new LogInByAccountAction();
        action.accountName = accountName;
        action.password = encryptToSHA512(password);

        LogInByAccountAction.Result result = action.call();
        result.throwExceptionIfError();
        System.out.println("Login succeeded.");
        return result.value.getInventory().getUuid();
    }

    private static String encryptToSHA512(String input) {
        try {
            MessageDigest md = MessageDigest.getInstance("SHA-512");
            md.reset();
            md.update(input.getBytes("utf8"));
            BigInteger bigInteger = new BigInteger(1, md.digest());
            return String.format("%0128x", bigInteger);
        } catch (NoSuchAlgorithmException |
UnsupportedEncodingException e) {
            throw new RuntimeException(e);
        }
    }
}

```

The following describes the steps of calling the preceding script:

1. In the following the script, enter the correct parameters, namely the IP address of ZStack Cloud management node, ZStack Cloud account, and ZStack Cloud account password, to the corresponding locations.

```
public static void main(String[] args) {
    String zstackServerHostname = "Enter the IP address of zstack
    management node.";
    String accountName = "Enter zstack account.";
    String password = "Enter zstack accnount password.";
    ZSClient.configure(
        new ZSConfig.Builder()
            .setHostname(zstackServerHostname)
            .setPort(8080)
            .setContextPath("zstack")
            .build()
    );
}
```

2. The following script is the SDK information of APIs that you call. When you call different APIs, enter the corresponding SDK information. For more information, see the API Reference.

```
QueryVmInstanceAction action = new QueryVmInstanceAction();
action.sessionId = sessionId;
QueryVmInstanceAction.Result result = action.call();
result.throwExceptionIfError();
```

3. After you completed encoding, compile and execute the script.

Use Python SDK to query VM instances

The following is the query script:

```
import time
import os
import sys
import traceback
import hashlib

import zstacklib.utils.log as log

# comment out next line to print detail zstack cli http command to
screen.
log.configure_log('/var/log/zstack/zstack-sdk.log', log_to_console=
False)

import apibinding.api_actions as api_actions
from apibinding import api
import xml.etree.cElementTree as etree
import apibinding.inventory as inventory

zstack_server_ip = os.environ['ZS_SERVER_IP']
# Set the account name or username used to log into the Cloud.
user_name = 'admin'
# Set the password used to log into the Cloud.
user_password = 'password'
# Specify the UUID of the host where the VM instances running.
host_uuid = 'acb492ce8cd640c8bb73bae75ea00adf'
```

```

# Must keep.
def sync_call(apiCmd, session_uuid):
    api_instance = api.Api(host=zstack_server_ip, port='8080')
    if session_uuid:
        api_instance.set_session_to_api_message(apiCmd, session_uuid)
    (name, reply) = api_instance.sync_call(apiCmd, )
    if not reply.success: raise api.ApiError("Sync call at %s: [%s]
meets error: %s." % (
        zstack_server_ip, apiCmd.__class__.__name__, api.error_code
_to_string(reply.error)))
    # print("[Sync call at %s]: [%s] Success" % (zstack_server_ip,
apiCmd.__class__.__name__))
    return reply

# Must keep.
def async_call(apiCmd, session_uuid):
    api_instance = api.Api(host=zstack_server_ip, port='8080')
    api_instance.set_session_to_api_message(apiCmd, session_uuid)
    (name, event) = api_instance.async_call_wait_for_complete(apiCmd)
    time.sleep(1)
    if not event.success: raise api.ApiError("Async call at %s: [%s]
meets error: %s." % (
        zstack_server_ip, apiCmd.__class__.__name__, api.error_code
_to_string(reply.error)))
    # print("[Async call at %s]: [%s] Success" % (zstack_server_ip,
apiCmd.__class__.__name__))
    return event

# Must keep.
def login_as_admin():
    accountName = user_name
    password = user_password
    return login_by_account(accountName, password)

# Must keep.
#tag::login_by_account[]
def login_by_account(name, password, timeout=60000):
    login = api_actions.LoginByAccountAction()
    login.accountName = name
    # Login API will use encrypted password string.
    login.password = hashlib.sha512(password).hexdigest()
    login.timeout = timeout
    session_uuid = async_call(login, None).inventory.uuid
    return session_uuid
#end::login_by_account[]

# logout must be called after session isn't needed.
# Must keep.
#tag::logout[]
def logout(session_uuid):
    logout = api_actions.LogOutAction()
    logout.timeout = 60000
    logout.sessionUuid = session_uuid
    async_call(logout, session_uuid)
#end::logout[]

```

```

# Must keep.
def execute_action_with_session(action, session_uuid, async=True):
    if session_uuid:
        action.sessionUuid = session_uuid
        if async:
            evt = async_call(action, session_uuid)
        else:
            evt = sync_call(action, session_uuid)
    else:
        session_uuid = login_as_admin()
        try:
            action.sessionUuid = session_uuid
            if async:
                evt = async_call(action, session_uuid)
            else:
                evt = sync_call(action, session_uuid)
        except Exception as e:
            traceback.print_exc(file=sys.stdout)
            raise e
        finally:
            # New login must be logout. If the active login session
            # exceed the limit, no account login is allowed.
            # The default active logged session limit is 500.
            logout(session_uuid)

    return evt

# All Query API need conditions. This help to generate common
conditions.
# The op including: =, >, <, in, not in, like etc.
def gen_query_conditions(name, op, value, conditions=[]):
    new_conditions = [{'name': name, 'op': op, 'value': value}]
    new_conditions.extend(conditions)
    return new_conditions

#tag::query_zone[]
def query_zone(conditions=[], session_uuid=None):
    action = api_actions.QueryZoneAction()
    action.timeout = 3000
    action.conditions = conditions
    evt = execute_action_with_session(action, session_uuid)
    print 'Zone infomation: %s ' % evt.inventories
    return evt.inventories
#end::query_zone[]

def query_vm_by_host(host_uuid, conditions=[], session_uuid=None):
    action = api_actions.QueryVmInstanceAction()
    action.conditions = gen_query_conditions('hostUuid', '=',
host_uuid, conditions)
    evt = execute_action_with_session(action, session_uuid)
    return evt.inventories

if __name__ == '__main__':
    session_uuid = login_as_admin()
    vm_list = query_vm_by_host(host_uuid, session_uuid=session_uuid)
    for vm in vm_list:
        print 'Retrieved VM [uuid:%s]\n' % vm.uuid

```

```
logout(session_uuid)
```

The following describes the steps of calling the preceding script:

1. In the preceding script, set the account/user name and password used to log into the Cloud and specify the UUID of the host where the VM instances running.
2. Run the **python \$full path of the script file** command to query VM instances.

The following describes the details of the preceding script:

- Before you call ZStack Cloud APIs, make sure that you have obtained a session UUID. After you complete your task, you need to call the logout API to exit the session.

Note:

The system has predefined the maximum number of sessions that can be concurrently used to 500. You can modify the value in the global setting. If you call large numbers of login APIs in a short period of time while do not log out in time, once the session threshold is reached, you cannot use new sessions.

- The login API script:

```
def login_by_account(name, password, timeout=60000):
    login = api_actions.LogInByAccountAction()
    login.accountName = name
    # Login API will use encrypted password string.
    login.password = hashlib.sha512(password).hexdigest()
    login.timeout = timeout
    session_uuid = async_call(login, None).inventory.uuid
    return session_uuid
```

Note:

The login password is encrypted by using the SHA-512 algorithm.

- The logout API script:

```
def logout(session_uuid):
    logout = api_actions.LogOutAction()
    logout.timeout = 60000
    logout.sessionUuid = session_uuid
    async_call(logout, session_uuid)
```

- The API script of querying VM instances:

```
def query_zone(conditions=[], session_uuid=None):
    action = api_actions.QueryZoneAction()
    action.timeout = 3000
    action.conditions = conditions
    evt = execute_action_with_session(action, session_uuid)
    print 'Zone information: %s ' % evt.inventories
```

```
return evt.inventories
```

- The following describes the preceding three API scripts:
 - The `session_uuid` parameter is optional. You can reuse the session that is in use for login.
 - The `execute_action_with_session` function is an encapsulated API that can be used to execute all ZStack Cloud functions. Even if you do not specify the `session_uuid` parameter, this function can accomplish system login before the API calling and system logout after the calling. Therefore, we recommend that you use this function for completing API callings.
 - For all query APIs, you need to use the `action.conditions` parameter to construct a query condition, for example, `action.conditions = ["name=TestZone", "state=Enabled"]`. If you need to retrieve the information of all resources, you can specify an empty array. For more information, see [Query API](#).
 - The returned value of an API calling indicates the execution results of the API calling. For example, the returned result of a query API is `evt.inventories`, which is an array. You can use the `count` function to calculate the size of the array. For most non-query APIs, the returned result is JSON-formatted data. For example, the returned result of the API `CreateVmInstanceAction` is `evt.inventory`, which is a JSON object. For more information, see [RESTful API Overview](#).

4 API Call with AccessKey

After you created an AccessKey successfully, a third-party platform can call ZStack Cloud private cloud APIs by using the AccessKey. The methods are as follows:

- Use SDK:

Take CreateVmInstance as an example. When you call ZStack Cloud private cloud APIs by using an AccessKey, enter **accessKeyId** and **accessKeySecret**. For example,

- Java SDK

```
CreateVmInstanceAction action = new CreateVmInstanceAction();
action.name = "vm1";
action.instanceOfferingUuid = "ae97ced44efc3314b8f7798972b4ba1a";
action.imageUuid = "da119f7906513eccabf271991c35a65e";
action.l3NetworkUuids = asList("cc0e4c5e77df3af68e59668e7f9e06c5");
action.dataDiskOfferingUuids = asList("19d22d051b063d379a2816daaf431838", "905d94a6abb5398fa1995f6398e3f6fc");
action.clusterUuid = "a0468dc645223f67bd0f2ab95276bbae";
action.description = "this is a vm";
action.strategy = "InstantStart";
action.accessKeyId = "Fnxc7KIQAdGTVxfX80jC";
action.accessKeySecret = "Do0AJUGVPrT9iJZlc1Q0tk7kzEusYidyqJxSmK0b";
CreateVmInstanceAction.Result res = action.call();
```

- Python SDK

```
CreateVmInstanceAction action = CreateVmInstanceAction()
action.name = "vm1"
action.instanceOfferingUuid = "ae97ced44efc3314b8f7798972b4ba1a"
action.imageUuid = "da119f7906513eccabf271991c35a65e"
action.l3NetworkUuids = [cc0e4c5e77df3af68e59668e7f9e06c5]
action.dataDiskOfferingUuids = [19d22d051b063d379a2816daaf431838,
905d94a6abb5398fa1995f6398e3f6fc]
action.clusterUuid = "a0468dc645223f67bd0f2ab95276bbae"
action.description = "this is a vm"
action.strategy = "InstantStart"
action.accessKeyId = "Fnxc7KIQAdGTVxfX80jC"
action.accessKeySecret = "Do0AJUGVPrT9iJZlc1Q0tk7kzEusYidyqJxSmK0b"
CreateVmInstanceAction.Result res = action.call()
```

- Call directly ZStack Cloud private cloud RESTful APIs.

1. Create an AccessKey.

```
CreateAccessKey accountUuid=df4fb9bbff14e97a67ab894c7b8c528
userUuid=df4fb9bbff14e97a67ab894c7b8c528
{
  "inventory": {
    "AccessKeyId": "N3Tf05yXZUmSjCf6mYIB",
    "AccessKeySecret": "XAlrsYvswmnEV3X1KWNs1WfZHD6aBI
IphmI0rX9S",
```

```

        "accountUuid": "dff4fb9bbff14e97a67ab894c7b8c528",
        "createDate": "Sep 6, 2018 1:50:06 PM",
        "lastOpDate": "Sep 6, 2018 1:50:06 PM",
        "userUuid": "dff4fb9bbff14e97a67ab894c7b8c528",
        "uuid": "ae353717ca7b4182bb87fb5d010235e8"
    },
    "success": true
}

```

2. Generate **date**.

```
python get_time.py
Thu, 06 Sep 2018 13:54:10 PRC
```

```

import datetime
import time

date = time.time()
#EEE, dd MMM yyyy HH:mm:ss z
str = datetime.datetime.fromtimestamp(date).strftime('%a, %d %b %Y
%H:%M:%S PRC')
print str

```

Note:

The time format must be **EEE, dd MMM yyyy HH:mm:ss zzz**.

3. Generate **digest**.

```

# python get_accesskey.py "vvSZpmj4cnB53qUDmm6E" "8heumeFTvI
eZxkTGfEYvVi9qVVPd9ffQNDALSPPb" \
"GET" "Fri, 06 Aug 2021 17:58:34 PRC" "/v1/vm-instances"
args: Namespace(aceskey_id='vvSZpmj4cnB53qUDmm6E', aceskey_s
ecret='8heumeFTvIeZxkTGfEYvVi9qVVPd9ffQNDALSPPb', \

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The VM instance name		0.6
instanceOf feringUuid	String	body (contained in the params structure)	The instance offering UUID. Specifies the CPU, memory, and other parameters of the VM instance.		0.6
imageUuid	String	body (contained in the params structure)	The image UUID. Specifies the image from which the root volume of the VM instance is created.		0.6
l3NetworkU uids	List	body (contained in the params structure)	The L3 network UUID list. You can specify one or more L3 networks . Then the VM instance		0.6

Name	Type	Location	Description	Optional Value	Starting Version
			will create a NIC on each network.		
type	String	body (contained in the params structure)	Optional. The VM instance type. This parameter is a reserved field for internal use.	- UserVm - ApplianceVm	0.6
rootDiskOfferingUuid	String	body (contained in the params structure)	Optional. The disk offering UUID of the root volume. - If the image type specified in imageUuid is ISO, you must specify rootDiskOfferingUuid to determine the size of the root volume to be created. - If the image type is not ISO, this parameter is optional.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
dataDiskSizes	List	body (contained in the params structure)	Optional. List of custom volume sizes . You can specify one or more volume sizes (repeatable) to create one or more data volumes for the VM instances.		4.4.24
dataDiskOfferingUuids	List	body (contained in the params structure)	Optional. The disk offering UUID list. You can specify one or more disk offering UUIDs to create one or more data volumes for the VM instance. (The UUIDs can be repeated.)		0.6
zoneUuid	String	body (contained in the params structure)	Optional. The zone UUID. If specified , the VM instance will be created in the		0.6

Name	Type	Location	Description	Optional Value	Starting Version
			specified zone.		
clusterUuid	String	body (contained in the params structure)	Optional. The cluster UUID. If specified, the VM instance will be created in the specified cluster. This parameter can override zoneUuid.		0.6
hostUuid	String	body (contained in the params structure)	Optional. The host UUID. If specified, the VM instance will be created on the specified host. This parameter can override zoneUuid and clusterUuid.		0.6
primaryStorageUuidForRootVolume	String	body (contained in the params structure)	Optional. The primary storage UUID.		1.8

Name	Type	Location	Description	Optional Value	Starting Version
			If specified, the root volume of the VM instance will be created on the specified primary storage.		
description	String	body (contained in the params structure)	Optional. The detailed description of the VM instance.		0.6
defaultL3NetworkUuid	String	body (contained in the params structure)	Optional. The UUID of the default L3 network. - If multiple L3 networks are specified in I3NetworkUuids, this parameter specifies the L3 network that provides default routing. - If not specified, the first		0.6

Name	Type	Location	Description	Optional Value	Starting Version
			network specified in <code>l3NetworkUuids</code> will be used as the default network.		
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID. If specified, the VM instance will use the specified value as UUID.		0.6
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID list.		3.4.0
systemTags	List	body	Optional. The system tags of the VM instance.		0.6
userTags	List	body	Optional. The user tags of the VM instance.		0.6
strategy	String	body (contained in the params structure)	Optional. The VM instance creation strategy. Start the VM instance		0.6

Name	Type	Location	Description	Optional Value	Starting Version
			immediately after creation. Do not start the VM instance after creation.		
dataVolumeSystemTagsOnIndex	Map	body (contained in the params structure)	Optional. The required system label mapping required for data volume index.		4.4.24

**Note:**

- When you create a VM instance in ZStack Cloud, you can specify an affinity group by adding the **affinityGroup** option to **SystemTags**.
 - Format of the **affinityGroup** option: `affinityGroupUuid::UUID`
 - Example: `affinityGroupUuid::5fd71606d5af451d981413f35367a8d6`
- When you create a VM instance in ZStack Cloud, you can specify a PCI device by adding the **PCI** option to **SystemTags**.
 - Format of the **PCI** option: `pciDevice::UUID`
 - Example: `pciDevice::634b48a7bca139d9944a0f95b0c2dddf`
- When you create a VM instance in ZStack Cloud, you can bind a CPU by adding the **vmCpuPinning** option to **SystemTags**.
 - Format of the **vmCpuPinning** option: `vmCpuPinning::binding policy`
 - Example: `vmCpuPinning::1:3;1-3:4-7,^6`
 - Only the administrator can update, create, or delete the SystemTag. When you clone a VM instance, you will also clone this SystemTag.
- When you create a VM instance in ZStack Cloud, you can use the userdata feature by adding the **userdata** option to **SystemTags**.

- Format of the **userdata** option: `userdata::base64 encoded script`
- Example: `userdata::I2Nsb3VkLWNvbWZpZwp1c2VyczoKIC0gbmFtZTogdGVzdAogICBzaGVsbDogL2Jpb290QDEwLTAtMC0x0Apib290Y21k0gogLSBta2RpciAvdG1wL3RlbXAgCndyaXRlX2ZpbGVz0gogLSBwYXRo0iAvdG1wL1pTdGFja19jb25mawcKICAgY29udGVudDogfAogICAgICAgSGVsbG8sd29ybGQhCiAgIHBlcm1pc3Npb25z0iAnMDc1NScKaG9zdG5hbWU6IFBlcmYtdGVzdApkaXNhYmxlX3Jvb3Q6IGZhbHNlCnNzaF9wd2F1dGg6IHllcwpjaHBhc3N3ZDoKICBsaXN00iB8CiAgICAgIHJvb3Q6d29yZAogIGV4cGlyZTogRmFsc2UKcnVuY21k0gogLSBlY2hvIGxzIC1sIC8gPi9yb290L2xpc3Quc2g=`
- When you create a VM instance in ZStack Cloud, you can specify an SSH key by adding the **sshkey** option to **SystemTags**.
 - Format of the **sshkey** option: `sshkey::public key content`
 - Example: `sshkey::ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAQDPAGDmLG2yW1fGQsek4PdBL6wiVMHuLr1566ITPAf8A20i5BaExoUwdPjA960aUSrtlsKlrXUMGEJwN1r1TrL9JdUMg7jww3QysGuS3P+bRsBe1TSGHS8Lnc9JY9HpoL4ZN/j0zTaZfju9eDzbVsbDrF91x3yDeeGH6IG6gWJn96HPfrlg7REfo04eBdfLstaaFC0lAXoB0rnGVnzRdQfwTNRGmMAyFzCV83H0hVzBJuL5VqtAT8a0lSC4QgZTNR0h6zbkTUUYyQu0QS65EaJCTyAhksuidRzyjLX3p3oMileKdJNugRa5IDHhGJXExIK+58Nvaqfj/03yN8If07sj root@hpe-77`
- When you create a VM instance in ZStack Cloud, you can specify the high availability (HA) level by adding the **ha** option to **SystemTags**.
 - Format of the **ha** option: `ha::NeverStop`
 - Example: `ha::NeverStop`
- When you create a VM instance in ZStack Cloud, you can specify the console mode by adding the **vmConsoleMode** option to **SystemTags**.
 - Format of the **vmConsoleMode** option: `vmConsoleMode::console mode`
 - Example: `vmConsoleMode::spice` or `vmConsoleMode::vnc`
- When you create a VM instance in ZStack Cloud, you can specify the USB redirection by adding the **usbRedirect** option to **SystemTags**.

- Format of the **usbRedirect** option: `usbRedirect::true`
- Example: `usbRedirect::true`
- When you create a VM instance in ZStack Cloud, you can specify the console password by adding the **consolePassword** option to **SystemTags**.
 - Format of the **consolePassword** option: `consolePassword::console password`
 - Example: `consolePassword::123456`
- When you create a VM instance in ZStack Cloud, you can specify an IP address for the L3 network by adding the **staticIp** option to **SystemTags**. If the network address type is double stack (IPv4+IPv6), you can add two **staticIp** options, which are IPv4 and IPv6, respectively.
 - Format of the **staticIp** option: `staticIp::L3 network UUID::specified IP`
 - Example: `staticIp::81a21a81cde84c1084c191354053a3b5::172.20.196.0`
- When you create a VM instance in ZStack Cloud, you can specify the MAC address of the corresponding NIC on the L3 network by adding the **customMac** option to **SystemTags**.
 - Format of the **customMac** option: `customMac::L3 network UUID::specified MAC address`
 - Example: `customMac::81a21a81cde84c1084c191354053a3b5::fa:00:37:ee:9f:00`
- When you create a VM instance in ZStack Cloud, you can specify the volume provisioning strategy by adding the **volumeProvisioningStrategy** option to **SystemTags**. The SystemTag is passed by using the **rootVolumeSystemTags** parameter.
 - Format of the **volumeProvisioningStrategy** option: `volumeProvisioningStrategy::ThinProvisioning, volumeProvisioningStrategy::ThickProvisioning`
 - Example: `volumeProvisioningStrategy::ThinProvisioning, volumeProvisioningStrategy::ThickProvisioning`
- When you create a VM instance in ZStack Cloud, you can specify the Ceph pool where the root volume is located by adding the **rootPoolName** option to **SystemTags**. The SystemTag is passed by using the **rootPoolName** parameter.
 - Format of the **rootPoolName** option: `ceph::rootPoolName::xxx. Here, xxx is the pool name.`
 - Example: `ceph::rootPoolName::pri-v-r-26e11ca6814d4e1ba504d845f7848db3`

- When you create a VM instance in ZStack Cloud, you can specify the mother board type by adding the **vmMachineType** option to **SystemTags**. The SystemTag is passed by using the **vmMachineType** parameter.
 - Format of the **vmMachineType** option: `vmMachineType::xx`. Here, `xx` is `pc` or `q35`.
 - Example: `vmMachineType::pc`
- When you create a VM instance in ZStack Cloud, you can specify the CD-ROM list by adding the **cdroms** option to **SystemTags**. The SystemTag is passed by using the **cdroms** parameter.
 - Format of the **cdroms** option: `cdroms::${cdrom-1 config}::${cdrom-2 config}::${cdrom-3 config}`. The CD-ROM configuration (cdrom config) has three options: `iso uuid` (the UUID of the ISO to be attached by the CD-ROM), `empty` (do not select any ISO), and `none` (do not configure the CD-ROM).
 - Examples:
 - Create an empty list: `cdrom: cdroms::empty::none::none`
 - Create three empty lists: `cdrom: cdroms::empty::empty::empty`
 - Create three lists with ISO attached: `cdrom: cdroms::iso_1_uuid::iso_2_uuid::iso_3_uuid`
- When you create a VM instance in ZStack Cloud, you can choose not to create any CD-ROM by adding the **createWithoutCdRom** option to **SystemTags**. The SystemTag is passed by using the **createWithoutCdRom** parameter.
 - Format of the **createWithoutCdRom** option: `createWithoutCdRom::true`
 - Example: `createWithoutCdRom::true`
- When you create a VM instance in ZStack Cloud, you can specify a MDEV device by adding the **mdevDevice** option to **SystemTags**.
 - Format of the **mdevDevice** option: `mdevDevice::MDEV_DEV_UUID`
 - Example: `mdevDevice::e2af8f869eff49d2a3d6f86cadcd27090`
- When you create a VM instance in ZStack Cloud, you can specify whether to automatically uninstall the physical PCI device allocated from the device specifications when the VM instance is shut down. You can also delete or change the configurations of existing VM instances. Note that you can add the **autoReleaseSpecRelatedPhysicalPciDevice** option to **SystemTags**.

- Format of the **autoReleaseSpecReleatedPhysicalPciDevice** option: `autoReleaseSpecReleatedPhysicalPciDevice`
- Example: `autoReleaseSpecReleatedPhysicalPciDevice`
- When you create a VM instance in ZStack Cloud, you can specify whether to automatically uninstall the virtual PCI device allocated from the device specifications when the VM instance is shut down. You can also delete or change the configurations of existing VM instances. Note that you can add the **autoReleaseSpecReleatedVirtualPciDevice** option to **SystemTags**.
 - Format of the **autoReleaseSpecReleatedVirtualPciDevice** option: `autoReleaseSpecReleatedVirtualPciDevice`
 - Example: `autoReleaseSpecReleatedVirtualPciDevice`
- When you create a VM instance in ZStack Cloud, you can specify the MDEV device specification and the device count allocated from the specification by adding the **mdevDeviceSpec** option to **SystemTags**.
 - Format of the **mdevDeviceSpec** option: `mdevDeviceSpec::MDEV_SPEC_UUID::MDEV_DEV_NUM`
 - Example: `mdevDeviceSpec::e2af8f869eff49d2a3d6f86cadcd27090::4`
- When you create a VM instance in ZStack Cloud, you can specify the PCI device specification and the device count allocated from the specification by adding the **pciDeviceSpec** option to **SystemTags**.
 - Format of the **pciDeviceSpec** option: `pciDeviceSpec::PCI_SPEC_UUID::PCI_DEV_NUM`
 - Example: `pciDeviceSpec::e2af8f869eff49d2a3d6f86cadcd27090::4`
- When you create a VM instance in ZStack Cloud, you can specify the resource priority by adding the **vmPriority** option to **SystemTags**.
 - Format of the **vmPriority** option: `vmPriority::PRIORITY_LEVEL`. Here, `PRIORITY_LEVEL` can be Normal or High.
 - Example: `vmPriority::Normal`
- When you create a VM instance in ZStack Cloud, the cloud records the version of the GuestTools ISO installed in the VM instance, compares the ISO version with that of the host, and decides whether to upgrade the GuestTools ISO. Note that you can add the **GuestTools** option to **SystemTags**.

- Format of the **GuestTools** option: `GuestTools::TOOLS_VERSION`. Here, the initial value of `TOOLS_VERSION` is 1.0.0. This value will change as the version of GuestTools is upgraded.
- Example: `GuestTools::1.0.0`
- Note: When a VM instance is created from an image, if the image has the GuestTools tag, the value of the GuestTools tag will be copied from the image to the new VM instance.
- When you create a VM instance in ZStack Cloud, you can set a cross-cluster HA policy by adding the **resourceBindings** option to **SystemTags**.
 - Format of the **resourceBindings** option: `resourceBindings::Cluster:clusterUuid`. Here, `clusterUuid` is the UUID of the cluster.
 - Example: `resourceBindings::Cluster:2sdasf231jvznsdak`
- When you create a VM instance in ZStack Cloud, you can specify a hostname by adding the **hostname** option to **SystemTags**.
 - Format of the **hostname** option: `hostname::xxxxx`. Here, `xxxxx` is the hostname.
 - Example: `hostname::host.zstack.org`
- When you create a VM instance in ZStack Cloud, you can enable SR-IOV by adding the **enableSRIOV** option to **SystemTags**.
 - Format of the **enableSRIOV** option: `enableSRIOV:: {L3_NETWORK_UUID}`
 - Example: `enableSRIOV::9e19dafef81c64fed8e34f72e27582339`
- When you create a VM instance in ZStack Cloud, you can use the **systemTags** parameter to specify whether the VM instance uses the **virtio** driver. You can set the value of the **systemTags** parameter to **driver**.
 - Format: `driver::virtio`.
 - Example: `driver::virtio`.
- When you create a VM instance in ZStack Cloud, you can set vNUMA for the VM instance. You can set the value of the **systemTags** parameter to **vmNumaEnable**.
 - Format: `vmNumaEnable::boolean`
 - Example: `vmNumaEnable::true`
- When you create a VM instance in ZStack Cloud, you can set EmulatorPin for the VM instance. You can set the value of the **systemTags** parameter to **vmEmulatorPinning**.
 - Format: `vmEmulatorPinning::CPU`

- Example: `vmEmulatorPinning::1,2,3,4,5,6,7`
- When you create a VM instance in ZStack Cloud, you can attach an XML Hook to the VM instance. You can set the value of the **systemTags** parameters to **xmlHook**.
 - Format: `xmlhook::{xmlhookUuid}`
 - Example: `xmlhook::35a678b482514da5aee22a6ab17d71e1`

cpuSpeed	Long	The CPU speed.	0.6

Name	Type	Description	Starting Version
allocatorStrategy	String	The allocator strategy.	0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6
state	String	The state of the VM instance.	0.6
vmNics	List	See vmNics .	0.6
allVolumes	List	See allVolumes .	0.6

#vmNics

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
vmInstanceUuid	String	The VM instance UUID.	0.6
l3NetworkUuid	String	The L3 network UUID.	0.6
ip	String	The IP address.	0.6
mac	String	The MAC address.	0.6
netmask	String	The netmask.	0.6
gateway	String	The gateway.	0.6
metaData	String	The reserved field for internal use.	0.6
deviceId	Integer	The device ID. - An integer that indicates the order of NICs in the Ethernet device of the guest operating system. - For example, 0 usually means eth0 , and 1 usually means eth1.	0.6
createDate	Timestamp	The creation date.	0.6

Name	Type	Description	Starting Version
lastOpDate	Timestamp	The last operation date.	0.6

#allVolumes

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
name	String	The resource name.	0.6
description	String	The detailed description of the resource.	0.6
primaryStorageUuid	String	The primary storage UUID.	0.6
vmInstanceUuid	String	The VM instance UUID.	0.6
diskOfferingUuid	String	The disk offering UUID.	0.6
rootImageUuid	String	The UUID of the root volume image.	0.6
installPath	String	The installation path.	0.6
type	String	The volume type.	0.6
format	String	The volume format.	0.6
size	Long	The virtual size of the volume.	0.6
actualSize	Long	The actual size of the volume.	0.6
deviceId	Integer	The device ID.	0.6
state	String	The state of the volume.	0.6
status	String	The status of the volume.	0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6

Name	Type	Description	Starting Version
isShareable	Boolean	Whether the volume can be shared.	0.6

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The resource name.		3.10.0
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		3.10.0
instanceOfferingUuid	String	body (contained in the params structure)	Optional. The instance offering UUID . Note: This parameter is optional if you choose the CPU number		3.10.0

Name	Type	Location	Description	Optional Value	Starting Version
			and memory size.		
cpuNum	Integer	body (contained in the params structure)	Optional. The CPU number or memory size		3.10.0
memorySize	Long	body (contained in the params structure)	. Note: This parameter is optional if you choose instanceOf feringUuid.		3.10.0
l3NetworkUuids	List	body (contained in the params structure)	The L3 network UUID. Specifies one or more L3 networks . The VM instance will create one NIC on each L3 network.		3.10.0
type	String	body (contained in the params structure)	Optional. The VM type. The reserved field, which is no need to specify.	- UserVm - ApplianceVm	3.10.0
volumeUuid	String	body (contained in the params structure)	The volume UUID.		4.1.0
platform	String	body (contained in	Optional. The volume	- Linux - Windows	3.10.0

Name	Type	Location	Description	Optional Value	Starting Version
		the params structure)	system platform.	Other	
zoneUuid	String	body (contained in the params structure)	Optional. The zone UUID. If specified , the VM instance will will be created in the specified zone.		3.10.0
clusterUuid	String	body (contained in the params structure)	Optional. The cluster UUID. If specified, the VM instance will be created in the specified cluster. The resource priority of this parameter is higher than zoneUuid.		3.10.0
hostUuid	String	body (contained in the params structure)	Optional. The host UUID. If specified, the VM instance will be created in the specified		3.10.0

Name	Type	Location	Description	Optional Value	Starting Version
			host. The resource priority of this parameter is higher than zoneUuid and clusterUuid .		
primaryStorageUuid	String	body (contained in the params structure)	Optional. The primary storage UUID. If specified, the root volume of the VM instance will be created in the specified primary storage.		3.10.0
defaultL3NetworkUuid	String	body (contained in the params structure)	Optional. The default L3 network UUID. When l3NetworkUuids specifies multiple L3 networks, this parameter specifies to provide the		3.10.0

Name	Type	Location	Description	Optional Value	Starting Version
			default L3 network. If not specified, the first network of <code>l3NetworkUids</code> will be selected as the default network.		
strategy	String	body (contained in the params structure)	Optional. The VM creation strategy. - After the VM instance is created, the VM instance is started immediately. - After the VM instance is created, the VM instance will not be started.	- InstantStart - CreateStopped	3.10.0
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID. If specified, the VM instance will use this		3.10.0

Name	Type	Location	Description	Optional Value	Starting Version
			field as UUID.		
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID list.		3.10.0
systemTags	List	body	Optional. The system tags.		3.10.0
userTags	List	body	Optional. The user tags.		3.10.0

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
name	String	body (contained in the params structure)	The resource name.		4.1.0
description	String	body (contained in the params structure)	The detailed description of the resource.		4.1.0
instanceOf feringUuid	String	body (contained in the params structure)	The instance offering UUID.		4.1.0
cpuNum	Integer	body (contained in the params structure)	Optional. The number of CPU cores.		4.1.0
memorySize	Long	body (contained in the params structure)	Optional. The memory size.		4.1.0
l3NetworkU uids	List	body (contained in the params structure)	The L3 network UUID.		4.1.0
type	String	body (contained in the params structure)	Optional. The VM type.	- UserVm - ApplianceV m	4.1.0
volumeSnap shotGroupU uid	String	url	The snapshot group UUID.		4.1.0
zoneUuid	String	body (contained in the params structure)	Optiona. The zone UUID.		4.1.0
clusterUuid	String	body (contained in	Optional. The cluster UUID		4.1.0

Name	Type	Location	Description	Valid Value	Starting Version
		the params structure)			
hostUuid	String	body (contained in the params structure)	Optional. The host UUID.		4.1.0
primaryStorageUuidForRootVolume	String	body (contained in the params structure)	The UUID of the primary storage where the root volume resides.		4.1.0
defaultL3NetworkUuid	String	body (contained in the params structure)	Optional. The default L3 network UUID.		4.1.0
strategy	String	body (contained in the params structure)	Optional. The policy that specifies whether to start a VM instance when the instance is created.	- InstantStart - CreateStopped	4.1.0
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		4.1.0
tagUuids	List	body (contained in the params structure)	Optional. The tag UUIDs.		4.1.0
systemTags	List	body	Optional. The system tags.		4.1.0
userTags	List	body	Optional. The user tags.		4.1.0

Parameters

Name	Type	Location	Description	Optional Value	Starting Version
xmlBase64	String	body(contained in the params structure)	The resource name.		4.4.6
jsonImageInfos	String	body(contained in the params structure)	The JSON string that describes the relationship between disk ID and the image file.		4.4.6
backupStorageUuid	String	body(contained in the params structure)	The UUID of the backup storage that stores the uploaded image file.		4.4.6

Name	Type	Location	Description	Optional Value	Starting Version
jsonCreateVmParam	String	body(contained in the params structure)	The JSON string that contains the parameters used to create a VM instance.		4.4.6
deleteImageAfterSuccess	boolean	body(contained in the params structure)	Optional. Specifies whether to delete the image file after the deployment is completed.		4.4.6
deleteImageOnFail	boolean	body(contained in the params structure)	Optional. Specifies whether to delete the image file after the deployment fails.		4.4.6
resourceUuid	String	body(contained in the params structure)	Optional. The resource UUID.		4.4.6
tagUuids	List	body(contained in the params structure)	Optional. The tag UUIDs.		4.4.6
systemTags	List	body	Optional. The system tags.		4.4.6
userTags	List	body	Optional. The user tags.		4.4.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.4.6
description	String	The brief description of the error.	4.4.6
details	String	The details about the error.	4.4.6
elaboration	String	The reserved field. Default value: null.	4.4.6

Name	Type	Description	Starting Version
opaque	LinkedHashMap	The reserved field. Default value: null.	4.4.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.4.6

#ovfInfo

Name	Type	Description	Starting Version
vmName	String	The VM name.	4.4.6
disks	List	See disks .	4.4.6
networks	List	See networks .	4.4.6
cpu	OvfCpuInfo	See cpu .	4.4.6
memory	OvfMemoryInfo	See memory .	4.4.6
os	OvfOSInfo	See os .	4.4.6
systemInfo	OvfSystemInfo	See systemInfo .	4.4.6
nics	List	See nics .	4.4.6
cdDrivers	List	See cdDrivers .	4.4.6
volumes	List	See volumes .	4.4.6

#disks

Name	Type	Description	Starting Version
index	int	The disk number.	4.4.6
diskId	String	The disk ID.	4.4.6
fileRef	String	The file reference.	4.4.6
fileName	String	The image file name.	4.4.6
format	String	The image file format.	4.4.6
populatedSize	Long	The image file size.	4.4.6
capacity	Long	The disk capacity. Unit : byte.	4.4.6

#networks

Name	Type	Description	Starting Version
name	String	The network name.	4.4.6

#cpu

Name	Type	Description	Starting Version
instanceId	String	The instance ID.	4.4.6
quantity	Integer	The number of CPU cores.	4.4.6
coresPerSocket	Integer	The number of cores per CPU.	4.4.6

#memory

Name	Type	Description	Starting Version
instanceId	String	The instance ID.	4.4.6
quantity	Long	The memory size. Unit : byte.	4.4.6

#os

Name	Type	Description	Starting Version
id	Integer	The OS ID.	4.4.6
version	String	The OS version.	4.4.6
osType	String	The OS type.	4.4.6
description	String	The OS description.	4.4.6

#systemInfo

Name	Type	Description	Starting Version
virtualSystemType	String	The system type.	4.4.6
firmwareType	String	The firmware type.	4.4.6

#nics

Name	Type	Description	Starting Version
networkName	String	The network name.	4.4.6
nicModel	String	The NIC model.	4.4.6
nicName	String	The NIC name.	4.4.6
autoAllocation	Boolean	Indicates whether the NIC is auto allocated.	4.4.6

#cdDrivers

Name	Type	Description	Starting Version
autoAllocation	Boolean	Indicates whether the CD driver is auto allocated.	4.4.6
driverType	String	The driver type.	4.4.6
subType	String	The sub-type.	4.4.6
name	String	The driver name.	4.4.6

#volumes

Name	Type	Description	Starting Version
name	String	The disk name.	4.4.6
diskId	String	The disk ID.	4.4.6
driverType	String	The disk driver type.	4.4.6

SDK Sample

Java SDK

```
ParseOvfAction action = new ParseOvfAction();
action.xmlBase64 = "Base64 encoded ovf file content.";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
ParseOvfAction.Result res = action.call();
```

Python SDK

```
ParseOvfAction action = ParseOvfAction()
action.xmlBase64 = "Base64 encoded ovf file content."
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
ParseOvfAction.Result res = action.call()
```

5.1.1.8 DestroyVmInstance

API Request

URLs

```
DELETE zstack/v1/vm-instances/{uuid}?deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 8d618c25ba3b4eb7bc6dda7e47d1b6b4" \
-X DELETE http://localhost:8080/zstack/v1/vm-
instances/5e22e2b1c4ab40739cd0b7717368dfa7?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The VM instance UUID		0.6
deleteMode	String	body	Optional. The delete mode.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DestroyVmInstanceAction action = new DestroyVmInstanceAction();
action.uuid = "c0b82973fbed42a09f3a30ce142fb168";
action.deleteMode = "Permissive";
action.sessionId = "97ddb4b10e34452c90d8591927cf3de5";
DestroyVmInstanceAction.Result res = action.call();
```

Python SDK

```
DestroyVmInstanceAction action = DestroyVmInstanceAction()
action.uuid = "0de3629902f1449d86256934552d5b3d"
action.deleteMode = "Permissive"
action.sessionId = "931c9e7e586c4b5fa44ed1155985ac1a"
DestroyVmInstanceAction.Result res = action.call()
```

5.1.1.9 RecoverVmInstance

API Request

URLs

```
PUT zstack/v1/vm-instances/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "recoverVmInstance": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"recoverVmInstance":{}}' \
```

```
http://localhost:8080/zstack/v1/vm-
instances/0eb6f6f88ff93da48cfc5bca0dbd5c18/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The VM instance UUID		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

SDK Sample

Java SDK

```
RecoverVmInstanceAction action = new RecoverVmInstanceAction();
action.uuid = "526fac8545fb4aa0aa2c78209378d63f";
action.sessionId = "a52aa10c9d5d445cb44593e21c3895f3";
RecoverVmInstanceAction.Result res = action.call();
```

Python SDK

```
RecoverVmInstanceAction action = RecoverVmInstanceAction()
action.uuid = "d0b44ed4139f4a7fa50951b99c9b2fd3"
action.sessionId = "078d6751ce124bd5a1fb00015116db8b"
RecoverVmInstanceAction.Result res = action.call()
```

5.1.1.10 ExpungeVmInstance

API Request

URLs

```
PUT zstack/v1/vm-instances/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "expungeVmInstance": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"expungeVmInstance":{}}' \
http://localhost:8080/zstack/v1/vm-instances/
e57788f713963e98a99a9f6b0bd8482c/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The VM instance UUID		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
ExpungeVmInstanceAction action = new ExpungeVmInstanceAction();
action.uuid = "f3b0b9538e6a49a88e189ba2c42b728e";
action.sessionId = "332f2d77997446fbaef62df0411b2635";
ExpungeVmInstanceAction.Result res = action.call();
```

Python SDK

```
ExpungeVmInstanceAction action = ExpungeVmInstanceAction()
action.uuid = "1cc86ac86211480485a251a48bc1928e"
action.sessionId = "6af024d8e8bf44709b42ffa623e96073"
```

```
ExpungeVmInstanceAction.Result res = action.call()
```

5.1.1.11 QueryVmInstance

API Request

URLs

```
GET zstack/v1/vm-instances
GET zstack/v1/vm-instances/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 06771ba1b893402bb4c715b7acf3606e" \
-X GET http://localhost:8080/zstack/v1/vm-instances?
q=name=vm1&q=vmNics.ip=192.168.20.100
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 95c7b190063f423ea6b305f054af8bf5" \
-X GET http://localhost:8080/zstack/v1/vm-
instances/3b9c1b2bca5848459881bfad378540b5
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryVmInstance`, and pressing the **Tab** key.

name	String	The resource name.	0.6

Name	Type	Description	Starting Version
description	String	The detailed description of the resource.	0.6
zoneUuid	String	The zone UUID.	0.6
clusterUuid	String	The cluster UUID.	0.6
imageUuid	String	The image UUID.	0.6
hostUuid	String	The host UUID.	0.6
lastHostUuid	String		0.6
instanceOfferingUuid	String	The instance offering UUID.	0.6
rootVolumeUuid	String	The root volume UUID.	0.6
platform	String		0.6
architecture	String	The architecture type.	4.5.0
defaultL3NetworkUuid	String		0.6
type	String	The VM instance type. Options: • UserVm • ApplianceVm	0.6
hypervisorType	String		0.6
memorySize	Long		0.6
cpuNum	Integer		0.6
cpuSpeed	Long		0.6
allocatorStrategy	String		0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6
state	String	The state of the VM instance. Options: • Created • Starting • Running • Stopping	0.6

Name	Type	Description	Starting Version
		• Stopped • Rebooting • Destroying • Destroyed • Migrating • Expunging • Pausing • Paused • Resuming • VolumeMigrating • Unknown	
guestOsType	String	The Operating System type.	4.5.0
vmNics	List	See vmNics .	0.6
allVolumes	List	See allVolumes .	0.6
vmCdRoms	List	See vmCdRoms	4.5.0

**Note:**

The state of a VM instance can be changed as follows:

- A VM instance in the Created state can be changed to the Starting, Destroying, or Destroyed state.
- A VM instance in the Starting state can be changed to the Running, Stopped, Paused, Destroying, or Unknown state.
- A VM instance in the Running state can be changed to the Destroying, Stopping, Stopped, Rebooting, Migrating, Pausing, Paused, or Unknown state.
- A VM instance in the Stopping state can be changed to the Stopped, Destroying, Running, or Unknown state.
- A VM instance in the Stopped state can be changed to the Starting, Running, Paused, Destroying, VolumeMigrating, or Unknown state.
- A VM instance in the Migrating state can be changed to the Running, Stopped, Unknown, or Destroying state.
- A VM instance in the VolumeMigrating state can be changed to the Stopped, Unknown, or Destroying state.

- A VM instance in the Rebooting state can be changed to the Running, Stopped, Unknown, or Destroying state.
- A VM instance in the Paused state can be changed to the Resuming, Stopped, Running, Stopping, Destroying, Unknown, or Migrating state.
- A VM instance in the Pausing state can be changed to the Paused, Destroying, Running, or Unknown state.
- A VM instance in the Resuming state can be changed to the Running, Destroying, Paused, or Unknown state.
- A VM instance in the Unknown state can be changed to the Destroying, Stopping, Paused, Running, or Stopped state.
- A VM instance in the Destroying state can be changed to the Unknown, Destroyed, Running, or Expunging state.
- A VM instance in the Destroyed state can be changed to the Stopped state.

#vmNics

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
vmInstanceUuid	String	The VM instance UUID.	0.6
l3NetworkUuid	String	The L3 network UUID.	0.6
ip	String	The IP address.	0.6
mac	String	The MAC address.	0.6
hypervisorType	String	The hypervisor type.	0.6
netmask	String	The netmask.	0.6
gateway	String	The gateway.	0.6
metaData	String		0.6
ipVersion	Integer	The IP version.	0.6
deviceId	Integer	The device ID.	0.6
type	String	The NIC type.	0.6
usedIps	List	For more information, see usedIps	0.6
createDate	Timestamp	The creation date.	0.6

Name	Type	Description	Starting Version
lastOpDate	Timestamp	The last operation date.	0.6

#usedIps

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
ipRangeUuid	String	The IP range UUID.	0.6
l3NetworkUuid	String	The L3 network UUID.	0.6
ipVersion	Integer	The IP version.	3.1
ip	String	The IP address.	0.6
netmask	String	The netmask.	0.6
gateway	String	The gateway.	0.6
usedFor	String		0.6
ipInLong	long		0.6

isoInstallPath	String	The mount path of the ISO image.	4.5.0
name	String	The resource name.	4.5.0
description	String	The detailed description of the resource.	4.5.0
createDate	Timestamp	The creation date.	4.5.0

Name	Type	Description	Starting Version
lastOpDate	Timestamp	The last operation date.	4.5.0

SDK Sample

Java SDK

```
QueryVmInstanceAction action = new QueryVmInstanceAction();
action.conditions = asList("name=vm1", "vmNics.ip=192.168.20.100");
action.sessionId = "1a2f35770a8e4e53b4bfb9d0d7ae7e50";
QueryVmInstanceAction.Result res = action.call();
```

Python SDK

```
QueryVmInstanceAction action = QueryVmInstanceAction()
action.conditions = ["name=vm1", "vmNics.ip=192.168.20.100"]
action.sessionId = "0dd4f4ec663f4502ba3fedda9d0ebc1b"
QueryVmInstanceAction.Result res = action.call()
```

5.1.1.12 StartVmInstance

API Request

URLs

```
PUT zstack/v1/vm-instances/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "startVmInstance": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"startVmInstance":{}}' \
```

```
http://localhost:8080/zstack/v1/vm-
instances/647db3dbf974372ead60d4ba1c9efac3/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The VM instance UUID.		0.6
clusterUuid	String	body (contained in the startVmInstance structure)	Optional. The cluster UUID. If specified, the VM instance will be started in the specified cluster.		0.6
hostUuid	String	body (contained in the startVmInstance structure)	Optional. The host UUID. If specified, the VM instance will be started on the specified host. This parameter can override clusterUuid .		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

**Note:**

- When you start a VM instance in ZStack Cloud, the cloud records whether a VPC vRouter is added to an HA group. Note that you can add the **haUuid** option to **SystemTags**.
 - Format of the **haUuid** option: `haUuid::HA_GROUP_UUID`
 - Example: `haUuid::e2af8f869eff49d2a3d6f86cad27090`

SDK Sample

Java SDK

```
StopVmInstanceAction action = new StopVmInstanceAction();
action.uuid = "b3edccc737664a24b6b8be3a249b87fb";
action.type = "grace";
action.sessionId = "7f36a5bff7ae49c185302dca91470133";
StopVmInstanceAction.Result res = action.call();
```

Python SDK

```
StopVmInstanceAction action = StopVmInstanceAction()
action.uuid = "a6162b0be4104d069ab42f708d7da150"
action.type = "grace"
action.sessionId = "d369764a2e29479c9e70f86a3b4662e3"
StopVmInstanceAction.Result res = action.call()
```

5.1.1.14 RebootVmInstance

API Request

URLs

```
PUT zstack/v1/vm-instances/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "rebootVmInstance": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"rebootVmInstance":{}}' \
http://localhost:8080/zstack/v1/vm-
instances/5bae2edd13e73805a552df9a2aa8d4c9/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The VM instance UUID		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

SDK Sample

Java SDK

```
ResumeVmInstanceAction action = new ResumeVmInstanceAction();
action.uuid = "c1304094962b4254b4d36c6e2744c2d5";
action.sessionId = "45e29136a13c49108df2fc7671c72431";
ResumeVmInstanceAction.Result res = action.call();
```

Python SDK

```
ResumeVmInstanceAction action = ResumeVmInstanceAction()
action.uuid = "24876a8330574db78649efaf8bce7e62"
action.sessionId = "10f42b569887433fabdbb82672d32269"
ResumeVmInstanceAction.Result res = action.call()
```

5.1.1.17 ReimageVmInstance

API Request

URLs

```
PUT zstack/v1/vm-instances/{vmInstanceId}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "reimageVmInstance": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"reimageVmInstance":{}}' \
http://localhost:8080/zstack/v1/vm-instances/
f38615d717a438c39eca3b8b560a00ef/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vmInstance Uuid	String	url	The VM instance UUID		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

URLs

```
DELETE zstack/v1/delete/directory
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/delete/directory
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	body	The resource UUID.		4.6.0
deleteMode	String	body	Optional. The deletion mode.	• Permissive • Enforcing • Permissive	4.6.0
systemTags	List	body	Optional. The system tags.		4.6.0
userTags	List	body	Optional. The user tags.		4.6.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DeleteDirectoryAction action = new DeleteDirectoryAction();
action.uuid = "7e0f83ed1d1c3e0b81b4d93afa882ead";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteDirectoryAction.Result res = action.call();
```

Python SDK

```
DeleteDirectoryAction action = DeleteDirectoryAction()
action.uuid = "7e0f83ed1d1c3e0b81b4d93afa882ead"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteDirectoryAction.Result res = action.call()
```

5.1.1.20 AddResourcesToDirectory

API Request

URLs

```
POST zstack/v1/add/resources/directory
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "resourceUuids": [
      "ac852a8d7c8f3e15811e8f647f24d0f7",
      "5bde5466936638648574ac73fa0abeb0"
    ],
    "directoryUuid": "1eb4cb0f7ed33305aba79b4af9ac4594"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"resourceUids":
["ac852a8d7c8f3e15811e8f647f24d0f7", "5bde5466936638648574ac73fa0abeb0"], "directory
http://localhost:8080/zstack/v1/add/resources/directory
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
resourceUids	List	body (contained in the params structure)	The resource UUID.		4.6.0
directoryUuid	String	body (contained in the params structure)	The directory UUID.		4.6.0
systemTags	List	body	Optional. The system tags.		4.6.0
userTags	List	body	Optional. The user tags.		4.6.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
AddResourcesToDirectoryAction action = new AddResourcesToDirectoryAction();
action.resourceUids = asList("ac852a8d7c8f3e15811e8f647f24d0f7", "5bde5466936638648574ac73fa0abeb0");
action.directoryUuid = "1eb4cb0f7ed33305aba79b4af9ac4594";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
AddResourcesToDirectoryAction.Result res = action.call();
```

Python SDK

```
AddResourcesToDirectoryAction action = AddResourcesToDirectoryAction()
action.resourceUuids = [ac852a8d7c8f3e15811e8f647f24d0f7, 5bde546693
6638648574ac73fa0abeb0]
action.directoryUuid = "1eb4cb0f7ed33305aba79b4af9ac4594"

action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
MoveResourcesToDirectoryAction.Result res = action.call()
```

5.1.1.22 RemoveResourcesFromDirectory

API Request

URLs

```
DELETE zstack/v1/remove/resources/directory
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/remove/resources/directory
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
resourceUuids	List	body (contained in the params structure)	The resource UUID.		4.6.0
directoryUuid	String	body (contained in the params structure)	The directory UUID.		4.6.0
systemTags	List	body	Optional. The system tags.		4.6.0
userTags	List	body	Optional. The user tags.		4.6.0

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
  }
}
```

```

    "details": "Create VM on KVM timeout after 300s"
  }
}

```

SDK Sample

Java SDK

```

RemoveResourcesFromDirectoryAction action = new RemoveResourcesFromDirectoryAction();
action.resourceUuids = asList("564a0f94cf5432fea482f3b415730984", "6278513ce2ad336f9083ef62a49c614c");

RemoveResourcesFromDirectoryAction.Result res = action.call();

```

Python SDK

```

RemoveResourcesFromDirectoryAction action = RemoveResourcesFromDirectoryAction()
action.resourceUuids = [564a0f94cf5432fea482f3b415730984, 6278513ce2ad336f9083ef62a49c614c]
action.directoryUuid = "5612979b05e438aabefc6c7978aed875"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
RemoveResourcesFromDirectoryAction.Result res = action.call()

```

5.1.1.23 UpdateDirectory

API Request

URLs

```
PUT zstack/v1/update/directory
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```

{
  "updateDirectory": {
    "uuid": "66a79f93fd5d3d269302297dc1459f6e",
    "name": "test"
  },
  "systemTags": [],
  "userTags": []
}

```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateDirectory":
{"uuid":"66a79f93fd5d3d269302297dc1459f6e","name":"test"}}' http://
localhost:8080/zstack/v1/update/directory
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	body (contained in the params structure)	The resource UUID.		4.6.0
name	String	body (contained in the params structure)	The resource name.		4.6.0
systemTags	List	body	Optional. The system tags.		4.6.0
userTags	List	body	Optional. The user tags.		4.6.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "ce9c80c271df30eba545af5b7efc6b09",
    "name": "test",
    "groupName": "admin/first/second",
    "parentUuid": "5cc7f45b66783385b3f4a9d1ef109a5d",
    "rootDirectoryUuid": "57290934e96a305fbdad6ccb33bb64b8",
    "zoneUuid": "b103949274663c19b9675ea6f6505dd5",
    "type": "default"
  }
}
```

Name	Type	Description	Starting Version
success	boolean		4.6.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For	4.6.0

Name	Type	Description	Starting Version
		more information, see error .	
inventory	VmNicInventory	See inventory .	4.6.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.6.0
description	String	The brief description of the error.	4.6.0
details	String	The details about the error.	4.6.0
elaboration	String	The reserved field. Default value: null.	4.6.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.6.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.6.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	4.6.0
name	String	The resource name.	4.6.0
groupName	String	The name of the group that the directory is affiliated to.	4.6.0

Name	Type	Description	Starting Version
parentUuid	String	The parent directory UUID.	4.6.0
rootDirectoryUuid	String	The root directory UUID.	4.6.0
zoneUuid	String	The zone UUID.	4.6.0
type	String	The directory type.	4.6.0
createDate	Timestamp	The creation time.	4.6.0
lastOpDate	Timestamp	The last operation time	4.6.0

SDK Sample

Java SDK

```
UpdateDirectoryAction action = new UpdateDirectoryAction();
action.uuid = "66a79f93fd5d3d269302297dc1459f6e";
action.name = "test";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateDirectoryAction.Result res = action.call();
```

Python SDK

```
UpdateDirectoryAction action = UpdateDirectoryAction()
action.uuid = "66a79f93fd5d3d269302297dc1459f6e"
action.name = "test"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateDirectoryAction.Result res = action.call()
```

5.1.1.24 QueryDirectory

API Request

URLs

```
GET zstack/v1/directories
GET zstack/v1/directories/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X GET http://localhost:8080/zstack/v1/directories?
q=uuid=39b8a9d8cb2e32b893bd82c5c2be7e24
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/
directories/4cfe730d431f3550994064911c1c6e0e
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryDirectory`, and pressing the **Tab** key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "uuid": "b3c48edddae03e05b328a5b0926ae353",
      "name": "test",
      "groupName": "admin/test",
      "parentUuid": "d0dc05fcf5753c6888d0b082bc0f9caf",
      "rootDirectoryUuid": "3830935ca3823d05b9010f242139fad4",
      "zoneUuid": "0f7266aa26f339cb8f0b47a73d0ddc30",
      "type": "vminstance"
    }
  ]
}
```

Name	Type	Description	Starting Version
success	Boolean		5.3.20
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	5.3.20
inventories	List	See inventories .	5.3.20

#inventories

Name	Type	描述	起始版本
uuid	String	The resource UUID.	5.3.20
name	String	The resource name.	5.3.20
groupName	String	The group name.	5.3.20

Name	Type	描述	起始版本
parentUuid	String	The parent directory UUID.	5.3.20
rootDirectoryUuid	String	The root directory UUID.	5.3.20
zoneUuid	String	The zone UUID.	5.3.20
type	String	The directory type.	5.3.20
createDate	Timestamp	The creation time.	5.3.20
lastOpDate	Timestamp	The last operation time	5.3.20

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	5.3.20

elaboration	String	The reserved field. Default value: null.	5.3.20
opaque	LinkedHashMap	The reserved field. Default value: null.	5.3.20
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	5.3.20

SDK Sample

Java SDK

```
QueryDirectoryAction action = new QueryDirectoryAction();
action.conditions = asList("uuid=b07055c553733af095d0714456157626");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryDirectoryAction.Result res = action.call();
```

Python SDK

```
QueryDirectoryAction action = QueryDirectoryAction()
action.conditions = ["uuid=e38b6311766c3f88ab31c2d02db4e58f"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryDirectoryAction.Result res = action.call()
```

5.1.1.25 MigrateVm

API Request

URLs

```
PUT zstack/v1/vm-instances/{vmInstanceUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "migrateVm": {
    "hostUuid": "7571fb72e52b3fcab1a6992e7eef4cce",
    "migrateFromDestination": false,
    "allowUnknown": false,
    "downTime": 300
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \-X PUT -d
'{"migrateVm":
{"hostUuid":"7571fb72e52b3fcab1a6992e7eef4cce", "migrateFromDestination":false, "a
\
```

```
http://localhost:8080/zstack/v1/vm-instances/
c53c9b6235703b8ab96c1cc35859242d/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vmInstanceUuid	String	url	The VM instance UUID.		0.6
hostUuid	String	body (contained in the migrateVm structure)	Optional. The host UUID.		0.6
migrateFromDestination	Boolean	body (contained in the migrateVm structure)	Optional. Initiates the migration command from the destination host.		2.3
allowUnknown	boolean	body (contained in the migrateVm structure)	Optional. Whether allow VM instances whose state is unknown.		4.6.21
strategy	String	body (contained in the migrateVm structure)	Optional.	auto-converge	4.6.21
downTime	Integer	body (contained in the migrateVm structure)	Optional. The VM down time during the hot migration.		4.6.21
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

```

5.1.1.26 QueryShareableVolumeVmInstanceRef

API Request

URLs

```
GET zstack/v1/volumes/vm-instances/refs
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 9f5a9540d63e4ade922c141078b95af9" \
```

```
-X GET http://localhost:8080/zstack/v1/volumes/vm-instances/refs?
q=0c917562d5954544b37bf5e0ed0735a6&q=cddc1c17e94a43b5b50e1df53e076d11&q=2&q=Jan
22, 2017 2:41:37 PM&q=Jan 22, 2017 2:43:18 PM
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryShareableVolumeVmInstanceRef`, and pressing the **Tab** key.

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
QueryShareableVolumeVmInstanceRefAction action = new QueryShare
ableVolumeVmInstanceRefAction();
action.conditions = asList("0c917562d5954544b37bf5e0ed0735a6", "

SDK Sample

Java SDK

```
GetCandidateVmForAttachingIsoAction action = new GetCandidateVmForAttachingIsoAction();
action.isoUuid = "c7824c614de74f908bc7d82e6f16ebe7";
action.sessionId = "24b72cf532ce4e87be824b510dfe8289";
GetCandidateVmForAttachingIsoAction.Result res = action.call();
```

Python SDK

```
GetCandidateVmForAttachingIsoAction action = GetCandidateVmForAttachingIsoAction()
action.isoUuid = "3916247f217c44de99603f16ebe141bd"
action.sessionId = "a43eacd5ff59473f844257917e0b705c"
GetCandidateVmForAttachingIsoAction.Result res = action.call()
```

5.1.1.31 AttachIsoToVmInstance

API Request

URLs

```
POST zstack/v1/vm-instances/{vmInstanceUuid}/iso/{isoUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST http://localhost:8080/zstack/v1/vm-instances/
b1105c5dd00f323d99aa182dee237628/iso/8f36a77ab76e3425a571a7f75fca2d69
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vmInstanceUuid	String	url	The VM instance UUID.		0.6
isoUuid	String	url	The ISO UUID.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

**Note:**

- When you attach an ISO image to a VM instance in ZStack Cloud, you can specify the target CD-ROM by adding the **cdromUuid** option to **SystemTags**. The SystemTag is passed by using the **cdromUuid** parameter.
 - Format of the **cdromUuid** option: `cdromUuid::cdrom_xx_uuid`
 - Example: `cdromUuid::cdrom_xx_uuid`

#infoList

Name	Type	Description	Starting Version
hypervisor	String	The hypervisor. Generally, the value is qemu-kvm	4.6.21

Name	Type	Description	Satrting Version
currentVersion	String	The version of the hypervisor used by the VM instance or the host.	4.6.21
expectVersion	String	The expected hypervisor version. We recommend that you keep the hypervisor version of a VM instance consistent with that of the host it is running on and the hypervisor version of a host consistent with the MN recommended version.	4.6.21
matchState	String	Whether the current hypervisor version is consistent with the expected version. If the system cannot get the current version or the expected version, the value is Unknown here.	4.6.21

SDK Sample

Java SDK

```
GetVirtualizerInfoAction action = new GetVirtualizerInfoAction();
action.uuids = asList("b5432fcc423434e7a5f5876f1fe1e910", "67e54311bbe3b43b9c523b349b08ca9", "d64aeea721f7331aa15e7fb95eee7390");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetVirtualizerInfoAction.Result res = action.call();
```

Python SDK

```
GetVirtualizerInfoAction action = GetVirtualizerInfoAction()
action.uuids = [b5432fcc423434e7a5f5876f1fe1e910, 67e54311bbe3b43b9c523b349b08ca9, d64aeea721f7331aa15e7fb95eee7390]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
GetVirtualizerInfoAction.Result res = action.call()
```

5.1.1.36 AttachL3NetworkToVm

API Request

URLs

```
POST zstack/v1/vm-instances/{vmInstanceUuid}/l3-networks/
{l3NetworkUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "attachL3NetworkToVm": {
    "driverType": "E1000"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{}}' \
http://localhost:8080/zstack/v1/vm-instances/
f526e22f739838f4bcdffd20f0ba8a73/l3-
networks/00fab8159d1d3534802c588c2bd9a28b
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
vmInstanceUuid	String	url	The VM instance UUID.		0.6
l3NetworkUuid	String	url	The L3 network UUID.		0.6

Name	Type	Location	Description	Valid Value	Starting Version
staticIp	String	body (contained in the params structure)	Optional. Specifies the IP address to be allocated to the VM instance.		0.6
driverType	String	body	The NIC driver type.	The NIC driver type. Valid values: - E1000E - E1000 - Vmxnet3 - Sriov	4.0.0
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

**Note:**

- When you attach an L3 network to a VM instance in ZStack Cloud, you can enable SR-IOV by adding the **enableSRIOV** option to **SystemTags**.
 - Format of the **enableSRIOV** option: `enableSRIOV:: {L3_NETWORK_UUID}`
 - Example: `enableSRIOV::9e19dafe81c64fed8e34f72e27582339`
- When you create a VM instance in ZStack Cloud, you can specify an IP address for the L3 network by adding the **staticIp** option to **SystemTags**. If the network address type is double stack (IPv4+IPv6), you can add two **staticIp** options, which are IPv4 and IPv6, respectively.
 - Format of the **staticIp** option: `staticIp::L3 network UUID::specified IP`
 - Example: `staticIp::81a21a81cde84c1084c191354053a3b5::172.20.196.0`

```

5.1.1.38 CreateVmNic

API Request

URLs

```
POST zstack/v1/nics
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "l3NetworkUuid": "cbb5d7cd7f51332cb18c124ea430863f"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"l3NetworkUuid":"cbb5d7cd7f51332cb18c124ea430863f"}}' http://
localhost:8080/zstack/v1/nics
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
l3NetworkUuid	String	body(contained in the params structure)	The L3 network UUID.		4.0.0
ip	String	body(contained in the params structure)	Optional.		4.0.0

```

5.1.1.39 ChangeVmNicState

API Request

URLs

```
PUT zstack/v1/vm-instances/nics/{vmNicUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeVmNicState": {
    "state": "disable"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json; charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"changeVmNicState":{"state":"disable"}}'
http://localhost:8080/zstack/v1/vm-instances/
nics/17d47a3b35813bb5a90f9643200a0f40/actions
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
vmNicUuid	String	url	The VM NIC UUID.		4.6.0

Name	Type	Location	Description	Valid Value	Starting Version
state	String	body	The VM NIC state.		4.6.0
systemTags	List	body	Optional. The system tags.		4.6.0
userTags	List	body	Optional. The user tags.		4.6.0

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
uuid	String	url	The VM NIC UUID.		4.0.0
deleteMode	String	body	Optional.		4.0.0
systemTags	List	body	Optional. The system tags.		4.0.0
userTags	List	body	Optional. The user tags.		4.0.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteVmNicAction action = new DeleteVmNicAction();
action.uuid = "e99db1aeb43c3d82ae1ba427308200";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteVmNicAction.Result res = action.call();
```

Python SDK

```
DeleteVmNicAction action = DeleteVmNicAction()
action.uuid = "e99db1aeb43c3d82ae1ba427308200"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteVmNicAction.Result res = action.call()
```

5.1.1.42 QueryVmNic

API Request

URLs

```
GET zstack/v1/vm-instances/nics
```

```
GET zstack/v1/vm-instances/nics/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth: 185cf639b8b64150a2aa22ec84e2517b" \
-X GET http://localhost:8080/zstack/v1/vm-instances/nics?
q=ip=172.20.100.100
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth: 2e9d7313cbb6495ebb3ee5d0d5d20fde" \
-X GET http://localhost:8080/zstack/v1/vm-instances/
nics/7363f51baaab41538d5fe402a69d2529
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryVmNic**, and pressing the **Tab** key.

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
QueryVmNicAction action = new QueryVmNicAction();
action.conditions = asList("ip=172.20.100.100");
action.sessionId = "ca4e59e18f014c21afcdde859b2fba3a";
QueryVmNicAction.Result res = action.call();
```

Python SDK

```
QueryVmNicAction action = QueryVmNicAction()
action.conditions = ["ip=172.20.100.100"]
action.sessionId = "8549e75dbbe548348ca2848692fb7fd8"
```

```
QueryVmNicAction.Result res = action.call()
```

5.1.1.43 GetVmNicAttachedNetworkService

API Request

URLs

```
GET zstack/v1/vm-instances/nics/{vmNicUuid}/attached-networkservices
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/vm-instances/
nics/8c193a29a4a43fccab83fea5a7281856/attached-networkservices
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
vmNicUuid	String	url	The VM NIC UUID.		4.1.0
systemTags	List	query	Optional. The system tags.		4.1.0
userTags	List	query	Optional. The user tags.		4.1.0

API Response

Sample Response

```
{
  "networkServices": [
    "Eip"
  ]
}
```

Name	Type	Description	Starting Version
networkServices	List		4.1.0
error	ErrorCode	The error code. If not null, the operation	4.1.0

Name	Type	Description	Starting Version
		fails, or vice versa. For more information, see error .	

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.1.0
description	String	The brief description of the error.	4.1.0
details	String	The details about the error.	4.1.0
elaboration	String	The reserved field. Default value: null.	4.1.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.1.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.1.0

SDK Sample

Java SDK

```
GetVmNicAttachedNetworkServiceAction action = new GetVmNicAttachedNetworkServiceAction();
action.vmNicUuid = "8c193a29a4a43fccab83fea5a7281856";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetVmNicAttachedNetworkServiceAction.Result res = action.call();
```

Python SDK

```
GetVmNicAttachedNetworkServiceAction action = GetVmNicAttachedNetworkServiceAction()
action.vmNicUuid = "8c193a29a4a43fccab83fea5a7281856"
```

```
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetVmNicAttachedNetworkServiceAction.Result res = action.call()
```

5.1.1.44 ChangeVmNicNetwork

API Request

URLs

```
POST zstack/v1/vm-instances/nics/{vmNicUuid}/l3-networks/
{l3NetworkUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{}}' http://localhost:8080/zstack/v1/vm-
instances/nics/1183a0462aa83243a659ff91326888fb/l3-networks/
e46ab07103763f0dbd3e99af2e3be4b0
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
vmNicUuid	String	url	The VM NIC UUID.		4.1.0
destL3NetworkUuid	String	body (contained in the params structure)			4.1.0

Name	Type	Location	Description	Valid Value	Starting Version
systemTags	List	body	Optional. The system tags.		4.1.0
userTags	List	body	Optional. The user tags.		4.1.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "9d4cdab9192b3de3b2495b1e326910c7",
    "vmInstanceUuid": "0ae9a1992fb436a58e820bdc4dd17c4",
    "usedIpUuid": "c0c5860c05ce3e70b14b4f501fedff71",
    "l3NetworkUuid": "9390346b3a8a3c829b05dbe30569390a",
    "ip": "192.168.1.10",
    "mac": "00:0c:29:bd:99:fc",
    "netmask": "255.255.255.0",
    "gateway": "192.168.1.1",
    "deviceId": 0.0
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.1.0
inventory	VmNicInventory	See inventory .	4.1.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.1.0
description	String	The brief description of the error.	4.1.0

Name	Type	Description	Starting Version
details	String	The details about the error.	4.1.0
elaboration	String	The reserved field. Default value: null.	4.1.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.1.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.1.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	4.1.0
vmInstanceUuid	String	The VM UUID.	4.1.0
l3NetworkUuid	String	The L3 network UUID.	4.1.0
ip	String	The IP address.	4.1.0
mac	String	The MAC address.	4.1.0
hypervisorType	String	The hypervisor type.	4.1.0
netmask	String	The netmask.	4.1.0
gateway	String	The gateway.	4.1.0
metaData	String		4.1.0
ipVersion	Integer	The IP version.	4.1.0
deviceId	Integer	The device ID.	4.1.0
type	String	The NIC type.	4.1.0
createDate	Timestamp	The creation time.	4.1.0
lastOpDate	Timestamp	The last update time.	4.1.0
usedIps	List	See usedIps	4.1.0

#usedIps

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	4.1.0
ipRangeUuid	String	The IP range UUID.	4.1.0
l3NetworkUuid	String	The L3 network UUID.	4.1.0
ipVersion	Integer	The IP version.	4.1.0
ip	String	The IP address.	4.1.0
netmask	String	The netmask.	4.1.0
gateway	String	The gateway.	4.1.0
usedFor	String		4.1.0
ipInLong	long		4.1.0
vmNicUuid	String	The VM NIC UUID.	4.1.0
createDate	Timestamp	The creation time.	4.1.0
lastOpDate	Timestamp	The last update time.	4.1.0

SDK Sample

Java SDK

```
ChangeVmNicNetworkAction action = new ChangeVmNicNetworkAction();
action.vmNicUuid = "1183a0462aa83243a659ff91326888fb";
action.destL3NetworkUuid = "e46ab07103763f0dbd3e99af2e3be4b0";

GetCandidateL3NetworksForChangeVmNicNetworkAction.Result res = action.
call();
```

Python SDK

```
GetCandidateL3NetworksForChangeVmNicNetworkAction action = GetCandida
tel3NetworksForChangeVmNicNetworkAction()
action.vmNicUuid = "3382601183c9319384d5aa17ec956a3f"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
GetCandidateL3NetworksForChangeVmNicNetworkAction.Result res = action.call()
```

5.1.1.46 SetNicQos

API Request

URLs

```
PUT zstack/v1/vm-instances/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "setNicQos": {
    "outboundBandwidth": 819200.0,
    "inboundBandwidth": 819200.0
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"setNicQos":
{"outboundBandwidth":819200.0,"inboundBandwidth":819200.0}}' \
http://localhost:8080/zstack/v1/vm-
instances/1d86edf8c2e73980b83005e946449c57/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The VM NIC UUID.		0.6
outboundBandwidth	Long	body (contained in	Optional. The outbound bandwidth.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
		the params structure)			
inboundBandwidth	Long	body (contained in the params structure)	Optional. The inbound bandwidth.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
SetNicQoSAction action = new SetNicQoSAction();
action.uuid = "00cc6445774649b488f6a03b023d6701";
action.outboundBandwidth = 819200.0;
action.inboundBandwidth = 819200.0;
action.sessionId = "d5a1b6a5424e4b1c8cc23f77e8ba6d58";
SetNicQoSAction.Result res = action.call();
```

Python SDK

```
SetNicQoSAction action = SetNicQoSAction()
action.uuid = "71548ce2c00240a3a5b065080d47f399"
action.outboundBandwidth = 819200.0
action.inboundBandwidth = 819200.0
action.sessionId = "a86b3caf907045b9a82e3a0cb0597330"
```

```
SetNicQoSAction.Result res = action.call()
```

5.1.1.47 GetNicQos

API Request

URLs

```
GET zstack/v1/vm-instances/{uuid}/nic-qos
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 2715e1f9803745c79e73079012aea97e" \
-X GET http://localhost:8080/zstack/v1/vm-instances/
e3594dc6c70e4d6f8488c4d7c69807e6/nic-qos
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The VM NIC UUID.		0.6
systemTags	List	query	Optional. The system tags.		0.6
userTags	List	query	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "outboundBandwidth": 100000.0,
  "inboundBandwidth": 200000.0,
  "outboundBandwidthUpthreshold": 300000.0,
  "inboundBandwidthUpthreshold": 300000.0
}
```

Name	Type	Description	Starting Version
outboundBandwidth	long		0.6
inboundBandwidth	long		0.6

Name	Type	Description	Starting Version
success	boolean		0.6
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

GetNicQoSAction.Result res = action.call()
```

5.1.1.48 DeleteNicQos

API Request

URLs

```
DELETE zstack/v1/vm-instances/{uuid}/nic-qos?direction={direction}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "direction": "example"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json; charset=UTF-8" \
-H "Authorization: OAuth 2c879e6be1c64b079aec599845576657" \
-X DELETE http://localhost:8080/zstack/v1/vm-
instances/9f9a2eb79c9b4fe5881b109033020899/nic-QoS?direction=in
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The VM NIC UUID.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
direction	String	url	The direction , including inbound and outbound.	- in - out	0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteNicQoSAction action = new DeleteNicQoSAction();
action.uuid = "27b5b55e69284a8ea07871661de562a4";
action.direction = "example";
action.sessionId = "d83ac78201fc4ad38b17261bba4dc17b";
DeleteNicQoSAction.Result res = action.call();
```

Python SDK

```
DeleteNicQoSAction action = DeleteNicQoSAction()
action.uuid = "efb14319aaf14069a1066f2b07a0e328"
action.direction = "example"
action.sessionId = "a0a6598343404cc38356abfc58877bd8"
```

```
DeleteNicQoSAction.Result res = action.call()
```

5.1.1.49 GetInterdependentL3NetworksImages

API Request

URLs

```
GET zstack/v1/images-l3networks/dependencies
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "zoneUuid": "55852cdc71ef4774a9dc1eaf85a29c42",
    "imageUuid": "012be26a00ac4e9583afb5ef9d8dc322"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth ecd5117a63cf444cb71bba734e7458c4" \
-X GET http://localhost:8080/zstack/v1/images-l3networks/dependencies?
\
zoneUuid=55466c2e90ae46d88df91c4f72c3e304&imageUuid=40b1783bc2614500bf0926499bdc9
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
zoneUuid	String	query	The zone UUID. This parameter is required to specify the dependency between the L3 network and image.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
l3NetworkUuids	List	query	Optional. The L3 network UUID list.		0.6
imageUuid	String	query	Optional. The image UUID.		0.6
systemTags	List	query	Optional. The system tags.		0.6
userTags	List	query	Optional. The user tags.		0.6

API Response

Sample Response

```

opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

SDK Sample

Java SDK

```
GetVmSshKeyAction action = new GetVmSshKeyAction();
action.uuid = "71e1defb50aa42128605fc702cc00137";
action.sessionId = "2f3fe0048fc6485f9123541a1244411f";
GetVmSshKeyAction.Result res = action.call();
```

Python SDK

```
GetVmSshKeyAction action = GetVmSshKeyAction()
action.uuid = "c66da31c27004804b59f672002d4371c"
action.sessionId = "2b883a9c99e942f295beab6761ff8657"
```

```
GetVmSshKeyAction.Result res = action.call()
```

5.1.1.52 DeleteVmSshKey

API Request

URLs

```
DELETE zstack/v1/vm-instances/{uuid}/ssh-keys
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth: 2698b6ec6f4241e696c75416e8e31b48" \
-X DELETE http://localhost:8080/zstack/v1/vm-instances/
add84c70ff0f4c98b897d6a3d7ba475c/ssh-keys
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	Optional. The VM instance UUID.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

SDK Sample

Java SDK

```
DeleteVmSshKeyAction action = new DeleteVmSshKeyAction();
action.uuid = "59ab1ff13ea947769b7522cd95311837";
action.sessionId = "ad1c38b4ce1343a28a06d3eb08ae1123";
DeleteVmSshKeyAction.Result res = action.call();
```

Python SDK

```
DeleteVmSshKeyAction action = DeleteVmSshKeyAction()
action.uuid = "22b709aa71ec47a2a0e0f758b55e844e"
action.sessionId = "f70cfa4d6dc04f2aa567621501247954"
```

```
DeleteVmSshKeyAction.Result res = action.call()
```

5.1.1.53 ChangeVmPassword

API Request

URLs

```
PUT zstack/v1/vm-instances/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeVmPassword": {
    "password": "password",
    "account": "root"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"changeVmPassword":
{"password":"password","account":"root"}}' \
http://localhost:8080/zstack/v1/vm-
instances/6401e6a584b43fcfaebe401fd07f6f92/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
password	String	body (contained in the changeVmPa	The password.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
		ssword structure)			
account	String	body (contained in the changeVmPa ssword structure)	The account.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
ChangeVmPasswordAction action = new ChangeVmPasswordAction();
action.uuid = "68bbdbf738884c3486f0fc0faf42c42c";
action.password = "password";
action.account = "root";
action.sessionId = "815834f2143b45c0a16fab615616795a";
ChangeVmPasswordAction.Result res = action.call();
```

Python SDK

```
ChangeVmPasswordAction action = ChangeVmPasswordAction()
action.uuid = "39f2732b2c214fe29fb2fa82f748a4f6"
action.password = "password"
action.account = "root"
action.sessionId = "fee2d467d9af4dc5b541a56a736cb457"
```

```
ChangeVmPasswordAction.Result res = action.call()
```

5.1.1.54 SetVmConsolePassword

API Request

URLs

```
PUT zstack/v1/vm-instances/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "setVmConsolePassword": {
    "consolePassword": "password"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"setVmConsolePassword":{"consolePassword":"password"}}' \
http://localhost:8080/zstack/v1/vm-instances/18a8034dbb483acbad9400916fe1e56c/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The VM instance UUID		0.6
consolePassword	String	body (contained in the setVmConso	The console password, which is a		0.6

Name	Type	Location	Description	Optional Value	Starting Version
		lePassword structure)	plain text string.		
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6

Name	Type	Description	Starting Version
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

SDK Sample

Java SDK

```
DeleteVmConsolePasswordAction action = new DeleteVmConsolePasswordAction();
action.uuid = "ac34ea877bc24c0bb36e8d52d1046479";
action.sessionId = "dbd8f0f101bf4318bd44814c7f3b03da";
DeleteVmConsolePasswordAction.Result res = action.call();
```

Python SDK

```
DeleteVmConsolePasswordAction action = DeleteVmConsolePasswordAction()
action.uuid = "9cefd9cf5c2a409f91ff902931eade7b"
action.sessionId = "9514a4d5eacd4c4f9a5dccc7bd99e3"
DeleteVmConsolePasswordAction.Result res = action.call()
```

5.1.1.57 GetVmConsoleAddress

API Request

URLs

```
GET zstack/v1/vm-instances/{uuid}/console-addresses
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 5c66c9a616334283b055d150680fff98" \
-X GET http://localhost:8080/zstack/v1/vm-instances/
bf2211ae8eaf408b817d3a05c19e2226/console-addresses
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The VM instance UUID.		0.6
systemTags	List	query	Optional. The system tags.		0.6
userTags	List	query	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "hostIp": "192.168.10.100",
  "port": 5900.0,
  "protocol": "vnc",
  "vdiPortInfo": {
    "vncPort": 5900.0
  }
}
```

Name	Type	Description	Starting Version
hostIp	String	The IP address of the host where the VM instance is running.	0.6
port	int	The console port of the VM instance.	0.6
protocol	String	The console protocol of the VM instance. Options: - vnc - spice - vncAndSpice	0.6
success	boolean	Whether the operation succeeds.	0.6
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For	0.6

Name	Type	Description	Starting Version
		more information, see error .	
vdiPortInfo	vdiPortInfo	See vdiPortInfo .	3.7.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#vdiPortInfo

Name	Type	Description	Starting Version
vncPort	Integer	The VNC port No.	3.7.0
spicePort	Integer	The SPICE port No.	3.7.0
spiceTlsPort	Integer	If TLS encryption is enabled for SPICE, two ports will be available: spiceTlsPort and spicePort.	3.7.0

Name	Type	Description	Starting Version
		To connect the VM instance by using a SPICE client, use <code>spiceTlsPort</code> .	

SDK Sample

Java SDK

```
GetVmConsoleAddressAction action = new GetVmConsoleAddressAction();
action.uuid = "d6bb8b652c1445969b5c4227385956d3";
action.sessionId = "1c0ec00749234a96978591d641e0c64d";
GetVmConsoleAddressAction.Result res = action.call();
```

Python SDK

```
GetVmConsoleAddressAction action = GetVmConsoleAddressAction()
action.uuid = "f6b7fe2da3ae4c929ad1c8ed14f37c8e"
action.sessionId = "5f127b3df90245ed93ef9da531442fdc"
GetVmConsoleAddressAction.Result res = action.call()
```

5.1.1.58 SetVmHostname

API Request

URLs

```
PUT zstack/v1/vm-instances/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "setVmHostname": {
    "hostname": "vm1.zstack.org"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"setVmHostname":{"hostname":"vm1.zstack.org"}}' \
http://localhost:8080/zstack/v1/vm-
instances/0d71345add0230f2a893e7789a831b81/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The VM instance UUID		0.6
hostname	String	body (contained in the setVmHostname structure)	The hostname, which must conform to the RFC 1123 specification.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
SetVmHostnameAction action = new SetVmHostnameAction();
action.uuid = "ce11eb85ff0f417c9f1255f43e0bb124";
action.hostname = "vm1.zstack.org";
action.sessionId = "fc2d7aab6f0545029fa52fa068dabfbb";
```

```
SetVmHostnameAction.Result res = action.call();
```

Python SDK

```
SetVmHostnameAction action = SetVmHostnameAction()
action.uuid = "7f11dce627ce4a0db39f20ce2e1afc57"
action.hostname = "vm1.zstack.org"
action.sessionId = "cb33487362ca41599fc2b43a119d8bc6"
SetVmHostnameAction.Result res = action.call()
```

5.1.1.59 GetVmHostname

API Request

URLs

```
GET zstack/v1/vm-instances/{uuid}/hostnames
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth: 0e3cbe22c03a43bc9b7b3ae76c57a0e7" \
-X GET http://localhost:8080/zstack/v1/vm-instances/
c5c6665ccbe2444e9cfa393366cdb5d4/hostnames
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The VM instance UUID		0.6
systemTags	List	query	Optional. The system tags.		0.6
userTags	List	query	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "hostname": "vm1.zstack.orgl"
```

}

Name	Type	Description	Starting Version
hostname	String	The VM instance hostname.	0.6
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

SDK Sample

Java SDK

```
GetVmHostnameAction action = new GetVmHostnameAction();
action.uuid = "82c0f5918de14f65abe7ba5d37c28502";
action.sessionId = "24f9301f25784707a477483c5702c034";
```

```
GetVmHostnameAction.Result res = action.call();
```

Python SDK

```
GetVmHostnameAction action = GetVmHostnameAction()
action.uuid = "5070e337b731448ca0698f83c7fc4c26"
action.sessionId = "f13e0ed993134a8ea35a3d382a971b14"
GetVmHostnameAction.Result res = action.call()
```

5.1.1.60 DeleteVmHostname

API Request

URLs

```
DELETE zstack/v1/vm-instances/{uuid}/hostnames?deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth efe37b8868b54c6c93b9f83a04ffe27c" \
-X DELETE http://localhost:8080/zstack/v1/vm-instances/\
55fefc89f98b49f99e96bb01765d42ed/hostnames?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The VM instance UUID.		0.6
deleteMode	String	body	Optional. The delete mode.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
```

```

    "error": {
      "code": "SYS.1001",
      "description": "A message or a operation timeout",
      "details": "Create VM on KVM timeout after 300s"
    }
  }
}

```

SDK Sample

Java SDK

```

DeleteVmHostnameAction action = new DeleteVmHostnameAction();
action.uuid = "ab14af23812445e891695e0c9ef7b635";
action.deleteMode = "Permissive";
action.sessionId = "25d8bc148fcb4061b0aa340d1e4c68a8";
DeleteVmHostnameAction.Result res = action.call();

```

Python SDK

```

DeleteVmHostnameAction action = DeleteVmHostnameAction()
action.uuid = "0f4ad3768b1e4e8bb1ec33646a3067de"
action.deleteMode = "Permissive"
action.sessionId = "fb18f70b6fc24b5f955817aaabbae4cc"
DeleteVmHostnameAction.Result res = action.call()

```

5.1.1.61 CreateStartVmInstanceScheduler

API Request

URLs

```
POST zstack/v1/vm-instances/{vmUuid}/schedulers/starting
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```

{
  "params": {
    "schedulerName": "create-vm-scheduler",
    "schedulerDescription": "for test create vm scheduler",
    "type": "simple",
    "interval": 5.0,
    "repeatCount": 10.0,
    "startTime": 0.0
  },
  "systemTags": [],
  "userTags": []
}

```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth: cf1274ab34e448cdb7f8aabd8461683e" \
-X POST -d '{"params":{"schedulerName":"create-vm-
scheduler","schedulerDescription":\
"for test create vm
scheduler","type":"simple","interval":5.0,"repeatCount":10.0,"startTime":0.0}}'
http://localhost:8080/zstack/v1/vm-
instances/0a8a39e89a104282b0ff78446515d7f1/schedulers/starting
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vmUuid	String	url	The VM instance UUID.		0.6
clusterUuid	String	body (contained in the params structure)	Optional. The cluster UUID.		0.6
hostUuid	String	body (contained in the params structure)	Optional. The host UUID.		0.6
schedulerName	String	body (contained in the params structure)	The scheduler name.		1.6
schedulerDescription	String	body (contained in the params structure)	Optional. The scheduler description.		1.6
type	String	body (contained in the params structure)	The scheduler type, including: simple and cron.	• simple • cron	1.6

Name	Type	Location	Description	Optional Value	Starting Version
interval	Integer	body (contained in the params structure)	Optional. The scheduler interval. Unit: second.		1.6
repeatCount	Integer	body (contained in the params structure)	Optional. The scheduler repeat count. This parameter is applied to only schedulers of the simple type.		1.6
startTime	Long	body (contained in the params structure)	Optional. The scheduler start time, which must conform to the Unix timestamp format. If set to 0, the scheduler starts immediately.		1.6
cron	String	body (contained in the params structure)	Optional. The Cron expression, which must conform to the Java Quartz Cron format.		1.6
resourceUuid	String	body (contained in the params structure)	Optional. The UUID that is used to create a scheduler.		0.6
systemTags	List	body	Optional. The system tags.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "3e27a74894fb47b5a3c86c2b44409ccb",

```

5.1.1.63 CreateRebootVmInstanceScheduler

API Request

URLs

```
POST zstack/v1/vm-instances/{vmUuid}/schedulers/rebooting
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "schedulerName": "vm-scheduler",
    "schedulerDescription": "for test restart vm scheduler",
    "type": "simple",
    "interval": 5.0,
    "repeatCount": 10.0,
    "startTime": 0.0
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth fa354b2ef2b34f109f268d264eee4d87" \
-X POST http://localhost:8080/zstack/v1/vm-
instances/08eaedbeb14841c5bb8564663319fed9/\
schedulers/rebooting?
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vmUuid	String	url	The VM instance UUID		0.6

Name	Type	Location	Description	Optional Value	Starting Version
schedulerName	String	body (contained in the params structure)	The scheduler name.		1.6
schedulerDescription	String	body (contained in the params structure)	Optional. The scheduler description.		1.6
type	String	body (contained in the params structure)	The scheduler type, including: simple and cron.	• simple • cron	1.6
interval	Integer	body (contained in the params structure)	Optional. The scheduler interval. Unit: second.		1.6
repeatCount	Integer	body (contained in the params structure)	Optional. The scheduler repeat count. This parameter is applied to only schedulers of the simple type.		1.6
startTime	Long	body (contained in the params structure)	Optional. The scheduler start time, which must conform to the Unix timestamp format. If set to 0, the scheduler starts immediately.		1.6

Name	Type	Location	Description	Optional Value	Starting Version
cron	String	body (contained in the params structure)	Optional. The Cron expression, which must conform to the Java Quartz Cron format.		1.6
resourceUuid	String	body (contained in the params structure)	Optional. The UUID that is used to create a scheduler.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {

5.1.1.64 GetVmBootOrder

API Request

URLs

```
GET zstack/v1/vm-instances/{uuid}/boot-orders
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
```

```
-H "Authorization: OAuth: 458995c072644d28b32b26f69e512c2c" \
-X GET http://localhost:8080/zstack/v1/vm-
instances/426cff83f17d4a5aa7c752484d730f20/boot-orders
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The VM instance UUID.		0.6
systemTags	List	query	Optional. The system tags.		0.6
userTags	List	query	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "order": [
    "HardDisk",
    "CdRom"
  ]
}
```

Name	Type	Description	Starting Version
orders	List	The boot device list.	0.6
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6

Name	Type	Description	Starting Version
elaboration	String	The reserved field. Default value: null .	0.6
opaque	LinkedHashMap	The reserved field. Default value: null .	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

SDK Sample

Java SDK

```
GetVmBootOrderAction action = new GetVmBootOrderAction();
action.uuid = "914ab429715b40d59efa76c1ccfe64d8";
action.sessionId = "0472be4a6e2c4e7c9d7bcf3da2938313";
GetVmBootOrderAction.Result res = action.call();
```

Python SDK

```
GetVmBootOrderAction action = GetVmBootOrderAction()
action.uuid = "cba88e6e561049c8b7beaeccf4d46279"
action.sessionId = "bd37fd5e33e847d4bef4bb536d6410ea"
GetVmBootOrderAction.Result res = action.call()
```

5.1.1.65 SetVmBootOrder

API Request

URLs

```
PUT zstack/v1/vm-instances/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "setVmBootOrder": {
    "bootOrder": [
      "CdRom",
      "HardDisk"
    ]
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"setVmBootOrder":{"bootOrder":["CdRom","HardDisk"]}}' \
http://localhost:8080/zstack/v1/vm-instances/
f757785b3980305095c89eb2b4e1b785/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The VM instance UUID.		0.6
bootOrder	List	body (contained in the setVmBootOrder structure)	Optional. The boot device. Options: • CdRom: CD-ROM • HardDisk: hard disk • Network: network If not specified, the default boot order (HardDisk, CdRom, CdRom) will be used.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

**Note:**

- When you set the boot order for a VM instance in ZStack Cloud, you can specify whether to make the setting take effect only once on the next VM boot by adding the **bootOrderOnce** option to **SystemTags**. Valid values: true and false.
 - Syntax: `bootOrderOnce:: {%s}`
 - Example: `bootOrderOnce:: true`

GetVmStartingCandidateClustersHostsAction.Result res = action.call();
```

Python SDK

```
GetVmStartingCandidateClustersHostsAction action = GetVmStartingCandidateClustersHostsAction()
action.uuid = "0cb8127bcfb8431497562f7464ee9920"
action.sessionId = "9320fb483c3c4926a7870ffa045088b2"
```

```
GetVmStartingCandidateClustersHostsAction.Result res = action.call()
```

5.1.1.68 SetVmStaticIp

API Request

URLs

```
PUT zstack/v1/vm-instances/{vmInstanceUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "setVmStaticIp": {
    "l3NetworkUuid": "61e66d487dff454f9509a1f19606d274",
    "ip": "192.168.10.10"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"setVmStaticIp":
{"l3NetworkUuid": "9fcbd78edb58391f8d9b879ea87598fd", "ip": "192.168.10.10"}}'
http://localhost:8080/zstack/v1/vm-instances/
e3749802228a36038d0e17041414fd17/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vmInstanceUuid	String	url	The VM instance UUID.		0.6
l3NetworkUuid	String	body (contained in the	The L3 network UUID.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
		setVmStaticIp structure)			
ip	String	body (contained in the setVmStaticIp structure)	Optional. The specified IP address.		4.6.21
ip6	String	body (contained in the setVmStaticIp structure)	Optional. The specified IPv6 address.		3.10.0
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6
netmask	String	body (contained in the setVmStaticIp structure)	Optional. The IPv4 netmask.		4.6.21
gateway	String	body (contained in the setVmStaticIp structure)	Optional. The IPv4 gateway.		4.6.21
ipv6Gateway	String	body (contained in the setVmStaticIp structure)	Optional. The IPv6 gateway.		4.6.21
ipv6Prefix	String	body (contained in the setVmStaticIp structure)	Optional. The IPv6 prefix.		4.6.21

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
SetVmStaticIpAction action = new SetVmStaticIpAction();
action.vmInstanceUuid = "e3749802228a36038d0e17041414fd17";
action.l3NetworkUuid = "9fcdbd78edb58391f8d9b879ea87598fd";
action.ip = "192.168.10.10";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
SetVmStaticIpAction.Result res = action.call();
```

Python SDK

```
SetVmStaticIpAction action = SetVmStaticIpAction()
action.vmInstanceUuid = "e3749802228a36038d0e17041414fd17"
action.l3NetworkUuid = "9fcdbd78edb58391f8d9b879ea87598fd"
action.ip = "192.168.10.10"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
SetVmStaticIpAction.Result res = action.call()
```

5.1.1.69 DeleteVmStaticIp

API Request

URLs

```
DELETE zstack/v1/vm-instances/{vmInstanceUuid}/static-ips?
l3NetworkUuid={l3NetworkUuid}&deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "l3NetworkUuid": "0a52c0bd8b4049699ff5b772f3f3eb59",
    "deleteMode": "Permissive"
  },
  "systemTags": [],
}
```

```
"userTags": []
}
```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 64d0600e594944eca1f49970ab4ca25c" \
-X DELETE http://localhost:8080/zstack/v1/vm-
instances/faf465c53e7f47898b8f41c5e90e46d3/static-ips?
l3NetworkUuid=4ef401fb452e3b48af5914bcd336d670&deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vmInstanceUuid	String	url	The VM instance UUID.		0.6
l3NetworkUuid	String	body	The L3 network UUID.		0.6
deleteMode	String	body	Optional. The delete mode.		0.6
systemTags	List	body	Optional. The system tags.		0.6

action.sessionId = "71df5d9cf30845dba8d1ef804bdf2108"
GetVmCapabilitiesAction.Result res = action.call()
```

5.1.1.71 UpdateVmInstance

API Request

URLs

```
PUT zstack/v1/vm-instances/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateVmInstance": {
    "name": "new vm name"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateVmInstance":{"name":"new vm name"}}' http://localhost:8080/zstack/v1/vm-instances/dfa2feae60f431ac8d5f071f5594cfc1/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The VM instance UUID.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the updateVmInstance structure)	Optional. The VM instance name.		0.6
description	String	body (contained in the updateVmInstance structure)	Optional. The detailed description of the VM instance.		0.6
state	String	body (contained in the updateVmInstance structure)	Optional. The state of the VM instance. - Generally, the state of a VM instance cannot be updated directly. Otherwise, ZStack Cloud might misjudge the state of the VM instance. - This parameter can be used only when the actual state of the VM instance is inconsistent with the state recorded by ZStack Cloud, and the synchronization mechanism of ZStack Cloud has expired (which is usually a bug). - The administrator must fully understand the consequences of using this parameter.	- Stopped - Running	0.6
defaultL3NetworkUuid	String	body (contained in the	Optional. The UUID of the default L3 network.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
		updateVmInstance structure)			
platform	String	body (contained in the updateVmInstance structure)	Optional. The platform type of the VM instance.	- Linux - Windows - WindowsVirtio - Other - Paravirtualization	0.6
cpuNum	Integer	body (contained in the updateVmInstance structure)	Optional. - The CPU count of the VM instance. You must stop or enable the VM instance for the setting of this parameter to take effect. - The VM instance that is created when NUMA is set to true in global settings can be adjusted.		0.6
memorySize	Long	body (contained in the updateVmInstance structure)	Optional. - The memory size of the VM instance. You must stop or enable the VM instance for the setting of this parameter to take effect. - The VM instance that is created when NUMA is set to true in global settings can be adjusted.		0.6
guestOsType	String	body (contained	Optional.		4.1.0

Name	Type	Location	Description	Optional Value	Starting Version
		in the updateVmIn stance structure)			
systemTags	List	body	Optional. The system tags .		0.6
userTags	List	body	Optional. The user tags.		0.6

SDK Sample

Java SDK

```
UpdateVmInstanceAction action = new UpdateVmInstanceAction();
action.uuid = "c424899cef6f4723baf0aae3acbe6020";
action.name = "new vm name";
action.sessionId = "4320eeda74fa41788522c75ed42ec889";
UpdateVmInstanceAction.Result res = action.call();
```

Python SDK

```
UpdateVmInstanceAction action = UpdateVmInstanceAction()
action.uuid = "fb287c6cb9134d208d1ed054577ad249"
action.name = "new vm name"
action.sessionId = "2f01595d029449dbbf6c052ad1914271"
UpdateVmInstanceAction.Result res = action.call()
```

5.1.1.72 CloneVmInstance

API Request

URLs

```
PUT zstack/v1/vm-instances/{vmInstanceUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "cloneVmInstance": {
    "strategy": "InstantStart",
    "names": [
      "vm1",
      "vm2"
    ],
    "full": false
  },
  "systemTags": [],
```

```
"userTags": []
}
```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"cloneVmInstance":{"strategy":"InstantStart","names":
["vm1","vm2"],"full":false}}' \
http://localhost:8080/zstack/v1/vm-instances/
c4d628c203433f64b062ad07c8edf10d/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vmInstance Uuid	String	url	The VM instance UUID		0.6
strategy	String	body (contained in the cloneVmInstance structure)	Optional. The strategy.	- CreateStopped - InstantStart - JustCreate Note: JustCreate creates only a VM record without any initialization, and this VM is not displayed on the UI.	0.6
names	List	body (contained in the cloneVmInstance structure)	The VM instance name list.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
		tance structure)			
full	Boolean	body (contained in the cloneVmlns tance structure)	Optional. Whether to clone the data volume that is attached to the VM instance.		2.5.0
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6
primaryStorageUuidForRootVolume	String	body (contained in the cloneVmlns tance structure)	Optional.		4.6.21
primaryStorageUuidForDataVolume	String	body (contained in the cloneVmlns tance structure)	Optional		4.6.21
rootVolumeSystemTags	List	body (contained in the cloneVmlns tance structure)	Optional		4.6.21
dataVolumeSystemTags	List	body (contained in the cloneVmlns tance structure)	Optional.		4.6.21

Name	Type	Location	Description	Optional Value	Starting Version
clusterUuid	String	body (contained in the cloneVmInstance structure)	Optional. The cluster UUID.		4.6.21
hostUuid	String	body (contained in the cloneVmInstance structure)	Optional. The host UUID.		4.6.21
vmNicParams	List	body (contained in the cloneVmInstance structure)	Optional. The VM NIC parameter.		5.1.0

  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT '{"setVmClockTrack":
{"track":"guest","syncAfterVMResume":true,"intervalInSeconds":60.0}}'
http://localhost:8080/zstack/v1/vm-instances/
cc0a313462243900b6c843ff427b7f0e/actions
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
uuid	String	url	The resource UUID.		4.1.0
track	String	body (contained in the setVmClockTrack structure)		• guest • host	4.1.0
syncAfterVMResume	Boolean	body (contained in the setVmClockTrack structure)	Optional. Specifies whether to sync time when VM instances resume running.		4.4.24
intervalInSeconds	Integer	body (contained in the setVmClockTrack structure)	Optional. The interval of time sync.	• 0 • 60 • 600 • 1800 • 3600 • 7200 • 21600	4.4.24

Name	Type	Location	Description	Valid Value	Starting Version
				43200 86400	
systemTags	List	body	Optional. The system tags.		4.1.0
userTags	List	body	Optional. The user tags.		4.1.0

API Response

If the API succeeded, an empty JSON structure {} is returned. If the API failed, the returned JSON structure includes an error field. For example,

```
{
  "inventory": {
    "uuid": "19d64f55a9723e59849c0f9357a0dded",

rootImageUuid	String	The root volume image UUID.	4.1.0
installPath	String	The installation path of the volume on the primary storage.	4.1.0
type	String	The volume type.	4.1.0
format	String	The volume type.	4.1.0
size	Long	The volume size.	4.1.0
actualSize	Long	The actual size of the volume.	4.1.0

Name	Type	Description	Starting Version
deviceId	Integer		4.1.0
state	String	Indicates whether the disk is enabled.	4.1.0
status	String	The volume status.	4.1.0
createDate	Timestamp	The creation time.	4.1.0
lastOpDate	Timestamp	The last update time.	4.1.0
isShareable	Boolean	Indicates whether the volume is a shared volume.	4.1.0
volumeQos	String	The volume QoS, for example, total=1048576	4.1.0

SDK Sample

Java SDK

```
SetVmClockTrackAction action = new SetVmClockTrackAction();
action.uuid = "cc0a313462243900b6c843ff427b7f0e";
action.track = "guest";
action.syncAfterVMResume = true;
action.intervalInSeconds = 60.0;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
SetVmClockTrackAction.Result res = action.call();
```

Python SDK

```
SetVmClockTrackAction action = SetVmClockTrackAction()
action.uuid = "cc0a313462243900b6c843ff427b7f0e"
action.track = "guest"
action.syncAfterVMResume = true
action.intervalInSeconds = 60.0
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
SetVmClockTrackAction.Result res = action.call()
```

5.1.1.74 SyncVmClock

API Requests

URLs

```
PUT zstack/v1/vm-instances/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "syncVmClock": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Samples

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"syncVmClock":{}}' http://localhost:8080/zstack/v1/vm-
instances/b9b970400c1f4a6dad1976be1c63f698/actions
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
uuid	String	url	The resource UUID.		4.4.24
systemTags	List	body	Optional. The system tags.		4.4.24
userTags	List	body	Optional. The user tags.		4.4.24

API Response

If the API succeeded, an empty JSON structure `{}` is returned. If the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
SyncVmClockAction action = new SyncVmClockAction();
action.uuid = "bbf94dc05840489cbf8f5b5d1d0984dc";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
SyncVmClockAction.Result res = action.call();
```

Python SDK

```
SyncVmClockAction action = SyncVmClockAction()
action.uuid = "0ce0a34f854d487281b32b8fd3608390"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
SyncVmClockAction.Result res = action.call()
```

5.1.1.75 SetVmInstanceHaLevel

API Request

URLs

```
POST zstack/v1/vm-instances/{uuid}/ha-levels
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "level": "NeverStop"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"level":"NeverStop"}}' \
http://localhost:8080/zstack/v1/vm-
instances/76d39c6862b840a3aa4568d83db99022/ha-levels
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The VM instance UUID.		0.6
level	String	body (contained in the params structure)	The HA level of the VM instance. Option: NeverStop: The VM instance will never be stopped.	NeverStop	0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

If the API succeeded, an empty JSON structure `{}` is returned. If the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
SetVmInstanceHaLevelAction action = new SetVmInstanceHaLevelAction();
action.uuid = "76d39c6862b840a3aa4568d83db99022";
action.level = "NeverStop";
action.sessionId = "673a3db55e4a43739aa2b701462547f3";
SetVmInstanceHaLevelAction.Result res = action.call();
```

Python SDK

```
SetVmInstanceHaLevelAction action = SetVmInstanceHaLevelAction()
action.uuid = "76d39c6862b840a3aa4568d83db99022"
action.level = "NeverStop"
action.sessionId = "f631227267ef445a9d8066e163c6618a"
SetVmInstanceHaLevelAction.Result res = action.call()
```

5.1.1.76 GetVmInstanceHaLevel

API Request

URLs

```
GET zstack/v1/vm-instances/{uuid}/ha-levels
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 92f80693e3d641c68c014d4f762c0b70" \
-X GET http://localhost:8080/zstack/v1/vm-
instances/76d39c6862b840a3aa4568d83db99022/ha-levels
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The VM instance UUID		0.6
systemTags	List	query	Optional. The system tags.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
userTags	List	query	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "level": "NeverStop"
}
```

Name	Type	Description	Starting Version
level	String	The HA level of the VM instance, including NeverStop and OnHostFailure.	0.6
success	boolean		0.6
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6

Name	Type	Description	Starting Version
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

SDK Sample

Java SDK

```
GetVmInstanceHaLevelAction action = new GetVmInstanceHaLevelAction();
action.uuid = "76d39c6862b840a3aa4568d83db99022";
action.sessionId = "ed55da0421704d2ca59ff0106cae94bb";
GetVmInstanceHaLevelAction.Result res = action.call();
```

Python SDK

```
GetVmInstanceHaLevelAction action = GetVmInstanceHaLevelAction()
action.uuid = "76d39c6862b840a3aa4568d83db99022"
action.sessionId = "559a84ded13d4e88a7fdb01f2dfd47f0"
GetVmInstanceHaLevelAction.Result res = action.call()
```

5.1.1.77 DeleteVmInstanceHaLevel

API Request

URLs

```
DELETE zstack/v1/instances/{uuid}/ha-levels
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 038c30608df54956bea7e06d6adf7ffe" \
-X DELETE http://localhost:8080/zstack/v1/vm-
instances/76d39c6862b840a3aa4568d83db99022/ha-levels?
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The VM instance UUID.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteVmInstanceHaLevelAction action = new DeleteVmInstanceHaLevelAction();
action.uuid = "76d39c6862b840a3aa4568d83db99022";
action.sessionId = "0cc42e2185664cd6a762ea527075e9f9";
DeleteVmInstanceHaLevelAction.Result res = action.call();
```

Python SDK

```
DeleteVmInstanceHaLevelAction action = DeleteVmInstanceHaLevelAction()
action.uuid = "76d39c6862b840a3aa4568d83db99022"

```

```
DeleteVmInstanceHaLevelAction.Result res = action.call()
```

5.1.1.78 GetVmQga

API Request

URLs

```
GET zstack/v1/vm-instances/{uuid}/qga
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 34fc90e40acb4b59b0051485dc625b34" \
-X GET http://localhost:8080/zstack/v1/vm-instances/
ab76c455f44b4b1b8a33ecdde1a98eb3/qga
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
systemTags	List	query	Optional. The system tags.		0.6
userTags	List	query	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "uuid": "889251004c244ec6aaafd2df09b8cfcdbd",
  "enable": true
}
```

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
enable	boolean		0.6
error	ErrorCode	The error code. If not null, the operation	0.6

Name	Type	Description	Starting Version
		fails, or vice versa. For more information, see error .	

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6

cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

SDK Sample

Java SDK

```
GetVmQgaAction action = new GetVmQgaAction();
action.uuid = "f2e1551d87d6495faa2bbf3059f060c6";
action.sessionId = "1759cb82bcb44dd9b06cac166513ea41";
GetVmQgaAction.Result res = action.call();
```

Python SDK

```
GetVmQgaAction action = GetVmQgaAction()
action.uuid = "d9772f9d072f4412954e52516111cc3c"
action.sessionId = "9f1efc92185649659a77f8de8ea5d886"
```

```
GetVmQgaAction.Result res = action.call()
```

5.1.1.79 SetVmQga

API Request

URLs

```
PUT zstack/v1/vm-instances/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "setVmQga": {
    "enable": false
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"setVmQga":{"enable":false}}' \
http://localhost:8080/zstack/v1/vm-
instances/8f37ceee285c3418b28247388508601a/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
enable	boolean	body (contained in the params structure)			0.6

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
SetVmQgaAction action = new SetVmQgaAction();
action.uuid = "771991c9b47f45a392bddeadba95ab2b";
action.enable = false;
action.sessionId = "6dc45ce48e8345f89c8487bb9a5180f8";
SetVmQgaAction.Result res = action.call();
```

Python SDK

```
SetVmQgaAction action = SetVmQgaAction()
action.uuid = "084bb6e8ecd9497fb261049cce04b116"
action.enable = false
action.sessionId = "5e78bf8076a84933928ee8d2ef04eca9"
SetVmQgaAction.Result res = action.call()
```

5.1.1.80 QueryGuestToolsState

API Request

URLs

```
GET zstack/v1/guesttools
```

```
GET zstack/v1/guesttools/state
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \  
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \  
-X GET http://localhost:8080/zstack/v1/guesttools
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \  
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \  
-X GET http://localhost:8080/zstack/v1/guesttools/state
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using the CLI command tool, entering **QueryGuestToolsState**, and pressing the **Tab** key.

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{  
  "error": {  
    "code": "SYS.1001",  
    "description": "A message or a operation timeout",  
    "details": "Create VM on KVM timeout after 300s"  
  }  
}
```

SDK Sample

Java SDK

```
QueryGuestToolsStateAction action = new QueryGuestToolsStateAction();  
action.conditions = asList();  
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";  
QueryGuestToolsStateAction.Result res = action.call();
```

Python SDK

```
QueryGuestToolsStateAction action = QueryGuestToolsStateAction()  
action.conditions = []  
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
QueryGuestToolsStateAction.Result res = action.call()
```

5.1.1.81 UpdateGuestToolsState

API Request

URLs

```
PUT zstack/v1/vm-instances/{vmInstanceUuid}/guesttools-state
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateGuestToolsState": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateGuestToolsState":{}}' \
http://localhost:8080/zstack/v1/vm-
instances/5222bedcc3333b848b4cfb67e14bcc2d/guesttools-state
```

Required Parameters

Name	Type	Location	Description	Valid Values	Starting Version
vmInstanceUuid	String	url	The VM instance UUID		4.6.21
systemTags	List	body	Optional. The system tags.		4.6.21
userTags	List	body	Optional. The user UUIDs.		4.6.21

API Response

Response Sample

```
{
  "inventory": {
    "vmInstanceUuid": "321e85ca08b335e09f172041f7e710b5",
    "qgaState": "Running",
    "zwatchState": "Running",
    "version": "4.6.11",
    "platform": "Kylin",
    "osType": "Kylin"
  }
}
```

Name	Type		起始版本
success	boolean		4.6.21
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.6.21
inventory	GuestToolsStateInventory	See inventory .	4.6.21

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.6.21
description	String	The brief description of the error.	4.6.21
details	String	The details about the error.	4.6.21
elaboration	String	The reserved field. Default value: null.	4.6.21
opaque	LinkedHashMap	The reserved field. Default value: null.	4.6.21

Name	Type	Description	Starting Version
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.6.21

#inventory

Name	Type	Description	Starting Version
vmInstanceUuid	String	The VM instance UUID.	4.6.21
version	String	The VM GuestTools version.	4.6.21
platform	String	The VM OS platform type.	4.6.21
osType	String	The VM OS type.	4.6.21
createDate	Timestamp	The creation date.	4.6.21
lastOpDate	Timestamp	The last operation date.	4.6.21
qgaState	GuestToolsQgaState	See qgaState .	4.6.21
zwatchState	GuestToolsZWatchState	See zwatchState .	4.6.21

#qgaState

Name	Type	Description	Starting Version
NotInstalled	GuestToolsQgaState	The QGA is not installed.	4.6.21
Running	GuestToolsQgaState	The QGA is running.	4.6.21
NotRunning	GuestToolsQgaState	The QGA is stopped.	4.6.21
NotUpgraded	GuestToolsQgaState	The QGA needs to be upgraded.	4.6.21

#zwatchState

Name	Type	Description	Starting Version
NotInstalled	GuestTools ZWatchState	The zwatch is not installed.	4.6.21
Running	GuestTools ZWatchState	The zwtach is running.	4.6.21
NotRunning	GuestTools ZWatchState	The zwatch is not running.	4.6.21

SDK Sample

Java SDK

```
UpdateGuestToolsStateAction action = new UpdateGuestToolsStateAction
();
action.vmInstanceUuid = "5222bedcc3333b848b4cfb67e14bcc2d";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateGuestToolsStateAction.Result res = action.call();
```

Python SDK

```
UpdateGuestToolsStateAction action = UpdateGuestToolsStateAction()
action.vmInstanceUuid = "5222bedcc3333b848b4cfb67e14bcc2d"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateGuestToolsStateAction.Result res = action.call()
```

5.1.1.82 UpdateVmNetworkConfig

API Request

URLs

```
PUT zstack/v1/vm-instances/{vmInstanceUuid}/update-nic-config
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateVmNetworkConfig": {
    "vmNicUuids": [
      "afb48d4bfd193c6b9d46b866cb29a767"
    ]
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateVmNetworkConfig":{"vmNicUuids":
["afb48d4bfd193c6b9d46b866cb29a767"]}}' \
http://localhost:8080/zstack/v1/vm-
instances/1c8470e916873fe6ae0251c3f592a6c4/update-nic-config
```

Required Parameters

Name	Type	Location	Description	Valid Values	Starting Version
vmInstance Uuid	String	url	The VM instance UUID		4.6.21
vmNicUuids	List	body (contained in the updateVmNetworkConfig structure).			4.6.21
systemTags	List	body	Optional. The system tags.		4.6.21
userTags	List	body	Optional. The user tags.		4.6.21

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
UpdateVmNetworkConfigAction action = new UpdateVmNetworkConfigAction
();
action.vmInstanceId = "1c8470e916873fe6ae0251c3f592a6c4";
action.vmNicUuids = asList("afb48d4bfd193c6b9d46b866cb29a767");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateVmNetworkConfigAction.Result res = action.call();
```

Python SDK

```
UpdateVmNetworkConfigAction action = UpdateVmNetworkConfigAction()
action.vmInstanceId = "1c8470e916873fe6ae0251c3f592a6c4"
action.vmNicUuids = [afb48d4bfd193c6b9d46b866cb29a767]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateVmNetworkConfigAction.Result res = action.call()
```

5.1.1.83 GetVmRDP

API Request

URLs

```
GET zstack/v1/vm-instances/{uuid}/rdp
```

Headers

```
Authorization: OAuth the-session-uuid
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth c38710f23af942819cc2c431bd94407b" \
-X GET http://localhost:8080/zstack/v1/vm-
instances/78494eb669424e97b6f18920a920adbf/rdp
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.1
systemTags	List	query	Optional. The system tags.		2.1
userTags	List	query	Optional. The user tags.		2.1

API Response

Sample Response

```
{
  "enable": true
}
```

Name	Type	Description	Starting Version
enable	boolean	Whether the RDP switch is enabled for the VM instance. That is, whether the VM instance can be accessed through RDP.	2.1
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.1

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	2.1
description	String	The brief description of the error.	2.1
details	String	The details about the error.	2.1
elaboration	String	The reserved field. Default value: null.	2.1
opaque	LinkedHashMap	The reserved field. Default value: null.	2.1
cause	ErrorCode	The root error, which is the associated root	2.1

Name	Type	Description	Starting Version
		cause of the current error. If no root error exists, this parameter is null.	

SDK Sample

Java SDK

```
GetVmRDPAction action = new GetVmRDPAction();
action.uuid = "2503d2eb486e43469fef0e4864fb6c90";
action.sessionId = "380901023c664283a2a3edc0c52817f2";
GetVmRDPAction.Result res = action.call();
```

Python SDK

```
GetVmRDPAction action = GetVmRDPAction()
action.uuid = "4cec955330e44ac980b99f20c811f1cc"
action.sessionId = "2971ac1171da458b964bf689032ba778"
GetVmRDPAction.Result res = action.call()
```

5.1.1.84 SetVmRDP

API Request

URLs

```
PUT zstack/v1/vm-instances/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "setVmRDP": {
    "enable": true
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"setVmRDP":{"enable":true}}' \
http://localhost:8080/zstack/v1/vm-instances/
f523cb5736b630acb643dda6d31be5a0/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.2
enable	boolean	body (contained in the setVmRDP structure)	Whether the RDP switch is enabled for the VM instance. That is, whether the VM instance can be accessed through RDP.		2.2
systemTags	List	body	Optional. The system tags.		2.2
userTags	List	body	Optional. The user tags.		2.2

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
SetVmRDPAction action = new SetVmRDPAction();
action.uuid = "e2889e09bb0a4f1b9f2757d8bd0c1fc6";
action.enable = true;
action.sessionId = "595b40e65a1f4755a68573ab9ef6802c";
SetVmRDPAction.Result res = action.call();
```

Python SDK

```
SetVmRDPAction action = SetVmRDPAction()
action.uuid = "dc71514a6e1a490b9985b1dcb4faaff11"
action.enable = true
action.sessionId = "aee17676e2604d9ab50a4b8907c31568"
SetVmRDPAction.Result res = action.call()
```

5.1.1.85 GetVmMonitorNumber

API Request

URLs

```
GET zstack/v1/vm-instances/{uuid}/monitorNumber
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 536c3b51e70f441190204e645a3d2d76" \
-X GET http://localhost:8080/zstack/v1/vm-instances/
deb35f3b8ebf4b7e9765726a9c8e3505/monitorNumber
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.2
systemTags	List	query	Optional. The system tags.		2.2
userTags	List	query	Optional. The user tags.		2.2

API Response

Sample Response

```
{
  "monitorNumber": 2.0
}
```

Name	Type	Description	Starting Version
monitorNumber	Integer		2.2
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.2

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	2.2
description	String	The brief description of the error.	2.2
details	String	The details about the error.	2.2
elaboration	String	The reserved field. Default value: null.	2.2
opaque	LinkedHashMap	The reserved field. Default value: null.	2.2
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	2.2

SDK Sample

Java SDK

```
GetVmMonitorNumberAction action = new GetVmMonitorNumberAction();
action.uuid = "6415ca5909524c00b7b66c9662b45df1";
action.sessionId = "4bf39c422c2d4e01b5ab88da17096d0d";
GetVmMonitorNumberAction.Result res = action.call();
```

Python SDK

```
GetVmMonitorNumberAction action = GetVmMonitorNumberAction()
action.uuid = "dc6e40115e674ccab14d9425d0028428"
action.sessionId = "3f5d36676ca94b9183b567470a22ed19"
GetVmMonitorNumberAction.Result res = action.call()
```

5.1.1.86 SetVmMonitorNumber

API Request

URLs

```
PUT zstack/v1/vm-instances/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "setVmMonitorNumber": {
    "monitorNumber": 2.0
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"setVmMonitorNumber":{"monitorNumber":2.0}}' \
http://localhost:8080/zstack/v1/vm-instances/7cc2eec452593010bd2691f88385de7a/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.2
monitorNumber	Integer	body (contained in the setVmMonitorNumber structure)	The number of monitors.		2.2
systemTags	List	body	Optional. The system tags.		2.2
userTags	List	body	Optional. The user tags.		2.2

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
SetVmMonitorNumberAction action = new SetVmMonitorNumberAction();
action.uuid = "eb57f91af28a48dcb6c56220a9b6d24";
action.monitorNumber = 2.0;
action.sessionId = "d8b870a03f97490fa6c39085cec24da7";
SetVmMonitorNumberAction.Result res = action.call();
```

Python SDK

```
SetVmMonitorNumberAction action = SetVmMonitorNumberAction()
action.uuid = "9a07d71b055e4da7a2f172e4cf7f337f"
action.monitorNumber = 2.0
action.sessionId = "56766234a9a54fe3b70c0e28b22fea5c"
```

```
SetVmMonitorNumberAction.Result res = action.call()
```

5.1.1.87 ChangeVmImage

API Request

URLs

```
PUT zstack/v1/vm-instances/{vmInstanceUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeVmImage": {
    "imageUuid": "dbfd52c2f87c39cda8c8945fca8d6a5a"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"changeVmImage":
{"imageUuid":"dbfd52c2f87c39cda8c8945fca8d6a5a"}}' \
http://localhost:8080/zstack/v1/vm-instances/
af9e42b52dc836dfac3ee89b08c47488/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vmInstanceUuid	String	url	The VM instance UUID.		2.2
imageUuid	String	body (contained in the	The image UUID.		2.2

Name	Type	Location	Description	Optional Value	Starting Version
		changeVmlmage structure)			
resourceUuid	String	body (contained in the changeVmlmage structure)	Optional. The resource UUID.		2.2
systemTags	List	body	Optional. The system tags.		2.2
userTags	List	body	Optional. The user tags.		2.2

**Note:**

- When you change the root volume of a VM instance in ZStack Cloud, you can specify the Ceph pool where the root volume is located by adding the **rootPoolName** option to **SystemTags**. The SystemTag is passed by using the **rootPoolName** parameter.
 - Format of the **rootPoolName** option: `ceph::rootPoolName::xxx`. Here, `xxx` is the name of the Ceph pool.
 - Example: `ceph::rootPoolName::pri-v-r-26e11ca6814d4e1ba504d845f7848db3`

SDK Sample

Java SDK

```
GetImageCandidatesForVmToChangeAction action = new GetImageCa
ndidatesForVmToChangeAction();
action.vmInstanceUuid = "54f0aeb7a2536978aafb9eb7a95003e";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetImageCandidatesForVmToChangeAction.Result res = action.call();
```

Python SDK

```
GetImageCandidatesForVmToChangeAction action = GetImageCandidatesFo
rVmToChangeAction()
action.vmInstanceUuid = "54f0aeb7a2536978aafb9eb7a95003e"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetImageCandidatesForVmToChangeAction.Result res = action.call()
```

5.1.1.89 UpdateVmNicMac

API Request

URLs

```
PUT zstack/v1/vm-instances/nics/{vmNicUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateVmNicMac": {
```

```

    "mac": "fa:4c:ee:9a:76:00"
  },
  "systemTags": [],
  "userTags": []
}

```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateVmNicMac":{"mac":"fa:4c:ee:9a:76:00"}}' \
http://localhost:8080/zstack/v1/vm-instances/nics/
c6a34d551b36322ab83b87f7eab6bd41/actions

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vmNicUuid	String	url	The VM NIC UUID.		2.3
mac	String	body (contained in the updateVmNicMac structure)	The MAC address.		2.3
systemTags	List	body	Optional. The system tags.		2.3
userTags	List	body	Optional. The user tags.		2.3

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```

{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}

```

```
}
```

SDK Sample

Java SDK

```
UpdateVmNicMacAction action = new UpdateVmNicMacAction();
action.vmNicUuid = "c6a34d551b36322ab83b87f7eab6bd41";
action.mac = "fa:4c:ee:9a:76:00";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateVmNicMacAction.Result res = action.call();
```

Python SDK

```
UpdateVmNicMacAction action = UpdateVmNicMacAction()
action.vmNicUuid = "c6a34d551b36322ab83b87f7eab6bd41"
action.mac = "fa:4c:ee:9a:76:00"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateVmNicMacAction.Result res = action.call()
```

5.1.1.90 SetVmCleanTraffic

API Request

URLs

```
PUT zstack/v1/vm-instances/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "setVmCleanTraffic": {
    "enable": true
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X PUT -d '{"setVmCleanTraffic":{"enable":true}}'
http://localhost:8080/zstack/v1/vm-instances/
db90c27c8cc743e39ea7fa97a91617ba/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.1.0
enable	boolean	body (contained in the setVmCleanTraffic structure)	Whether to enable clean-traffic for the VM instance.	- enable - disable	3.1.0
systemTags	List	body	Optional. The system tags.		3.1.0
userTags	List	body	Optional. The user tags.		3.1.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
SetVmCleanTrafficAction action = new SetVmCleanTrafficAction();
action.uuid = "1e62596491bb4a708e737f1ec626a08e";
action.enable = true;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
SetVmCleanTrafficAction.Result res = action.call();
```

Python SDK

```
SetVmCleanTrafficAction action = SetVmCleanTrafficAction()
action.uuid = "69294c4a4e654535bbfd7fd92f4b52e9"
```

```

action.enable = true
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
SetVmCleanTrafficAction.Result res = action.call()

```

5.1.1.91 CreateVmCdRom

API Request

URLs

```
POST zstack/v1/vm-instances/cdroms
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```

{
  "params": {
    "name": "cd-1",
    "vmInstanceUuid": "157321b6fb043d8a923aca66e6388086",
    "description": "this is a cd-rom"
  },
  "systemTags": [],
  "userTags": []
}

```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":

action.uuid = "407c8e5cee4b3430bbb9f0f4d4c8a422";
action.name = "cd-2";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateVmCdRomAction.Result res = action.call();
```

Python SDK

```
UpdateVmCdRomAction action = UpdateVmCdRomAction()
action.uuid = "407c8e5cee4b3430bbb9f0f4d4c8a422"
action.name = "cd-2"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateVmCdRomAction.Result res = action.call()
```

5.1.1.94 SetVmInstanceDefaultCdRom

API Request

URLs

```
PUT zstack/v1/vm-instances/{vmInstanceUuid}/cdroms/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "setVmInstanceDefaultCdRom": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"setVmInstanceDefaultCdRom": {}' http://localhost:8080/zstack/v1/vm-
```

```
instances/d447a8ba0a7739ebb9ea4328740cb6df/
cdroms/65a54c4273433d74970e8bac4c406cd8/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.3.0
vmInstanceUuid	String	url	The VM instance UUID.		3.3.0
systemTags	List	body	Optional. The system tags.		3.3.0
userTags	List	body	Optional. The user tags.		3.3.0

API Response

Sample Response

```

```
QueryVmCdRomAction action = new QueryVmCdRomAction();
action.conditions = asList("name=cd-1");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryVmCdRomAction.Result res = action.call();
```

Python SDK

```
QueryVmCdRomAction action = QueryVmCdRomAction()
action.conditions = ["name=cd-1"]
```

```
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryVmCdRomAction.Result res = action.call()
```

5.1.1.96 UpdateVmPriority

API Request

URLs

```
PUT zstack/v1/vm-instances/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateVmPriority": {
    "priority": "High"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateVmPriority":{"priority":"High"}}'
http://localhost:8080/zstack/v1/vm-instances/
f308c452113832df898fb62ea87b2afc/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.7.0
priority	String	body (contained in the updateVmPr			3.7.0

Name	Type	Location	Description	Optional Value	Starting Version
		riority structure)			
systemTags	List	body	Optional. The system tags.		3.7.0
userTags	List	body	Optional. The user tags.		3.7.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
UpdateVmPriorityAction action = new UpdateVmPriorityAction();
action.uuid = "f308c452113832df898fb62ea87b2afc";
action.priority = "High";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateVmPriorityAction.Result res = action.call();
```

Python SDK

```
UpdateVmPriorityAction action = UpdateVmPriorityAction()
action.uuid = "f308c452113832df898fb62ea87b2afc"
action.priority = "High"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
UpdateVmPriorityAction.Result res = action.call()
```

5.1.1.97 SetVmQxlMemory

API Request

URLs

```
PUT zstack/v1/vm-instances/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "setVmQxlMemory": {
    "ram": 65536.0,
    "vram": 32768.0,
    "vgamem": 16384.0
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"setVmQxlMemory":
{"ram":65536.0,"vram":32768.0,"vgamem":16384.0}}'
http://localhost:8080/zstack/v1/vm-instances/
cc590b2129c437a487311b0f9a8a0dbc/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The VM instance UUID		3.7.0
ram	Integer	body (contained	Optional. The Random		3.7.0

Name	Type	Location	Description	Optional Value	Starting Version
		in the setVmQxlMemory structure)	Access Memory (RAM) size. Default value: 65536.		
vram	Integer	body (contained in the setVmQxlMemory structure)	Optional. The video RAM (VRAM) size. Default value: 32768.		3.7.0
vgamem	Integer	body (contained in the setVmQxlMemory structure)	Optional. The Video Graphics Array (VGA) memory size. Default value: 16384.		3.7.0
systemTags	List	body	Optional. The system tags.		3.7.0
userTags	List	body	Optional. The user tags.		3.7.0

**Note:**

- When you create a VM instance in ZStack Cloud, you can set the QXL memory size by adding the **qxlMemory** option to **SystemTags**. The SystemTag is passed by using the **qxlMemory** parameter.
 - Format of the **qxlMemory** option: `qxlMemory::ram::vram::vgamem`
 - Example: `qxlMemory::65536::32768::16384`

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
  }
}
```

```

    "details": "Create VM on KVM timeout after 300s"
  }
}

```

SDK Sample

Java SDK

```

SetVmQxlMemoryAction action = new SetVmQxlMemoryAction();
action.uuid = "cc590b2129c437a487311b0f9a8a0dbc";
action.ram = 65536.0;
action.vram = 32768.0;
action.vgamem = 16384.0;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
SetVmQxlMemoryAction.Result res = action.call();

```

Python SDK

```

SetVmQxlMemoryAction action = SetVmQxlMemoryAction()
action.uuid = "cc590b2129c437a487311b0f9a8a0dbc"
action.ram = 65536.0
action.vram = 32768.0
action.vgamem = 16384.0
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
SetVmQxlMemoryAction.Result res = action.call()

```

5.1.1.98 SetVmSoundType

API Request

URLs

```
PUT zstack/v1/vm-instances/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```

{
  "setVmSoundType": {
    "soundType": "ac97"
  },
  "systemTags": [],
  "userTags": []
}

```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"setVmSoundType":{"soundType":"ac97"}}' http://
localhost:8080/zstack/v1/vm-
instances/0ae1191601f430d88e1707716d24ff39/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The VM instance UUID		3.7.0
soundType	String	body (contained in the setVmSoundType structure)	The virtual sound card type. Default type: ICH6.	- ac97 - ich6	3.7.0
systemTags	List	body	Optional. The system tags.		3.7.0
userTags	List	body	Optional. The user tags.		3.7.0

**Note:**

- When you create a VM instance in ZStack Cloud, you can set the virtual sound card type by adding the **soundType** option to **SystemTags**. The SystemTag is passed by using the **soundType** parameter.
 - Format of the **soundType** option: `soundType::type`
 - Example: `soundType::ac97`
 - Note: The system compatibility varies depending on different Windows versions. Windows XP only supports the AC97 driver. In Windows 10, ICH6 is driver-free. Windows 7 supports both AC97 and ICH6 drivers.

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
SetVmSoundTypeAction action = new SetVmSoundTypeAction();
action.uuid = "0ae1191601f430d88e1707716d24ff39";
action.soundType = "ac97";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
SetVmSoundTypeAction.Result res = action.call();
```

Python SDK

```
SetVmSoundTypeAction action = SetVmSoundTypeAction()
action.uuid = "0ae1191601f430d88e1707716d24ff39"
action.soundType = "ac97"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
SetVmSoundTypeAction.Result res = action.call()
```

5.1.1.99 GetSpiceCertificates

API Request

URLs

```
GET zstack/v1/spice/certificates
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/spice/certificates
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	query	Optional. The system tags.		3.7.0
userTags	List	query	Optional. The user tags.		3.7.0

API Response

SDK Sample

Java SDK

```
GetSpiceCertificatesAction action = new GetSpiceCertificatesAction();  
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";  
GetSpiceCertificatesAction.Result res = action.call();
```

Python SDK

```
GetSpiceCertificatesAction action = GetSpiceCertificatesAction()  
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
GetSpiceCertificatesAction.Result res = action.call()
```

5.1.1.100 AttachGuestToolsIsoToVm

API Request

URLs

```
PUT zstack/v1/vm-instances/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "attachGuestToolsIsoToVm": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"attachGuestToolsIsoToVm":{}}'
http://localhost:8080/zstack/v1/vm-instances/
f58d939e32073aa49acc4897bf81ae45/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.7.0
systemTags	List	body	Optional. The system tags.		3.7.0
userTags	List	body	Optional. The user tags.		3.7.0

**Note:**

- After you attach the GuestTools to a VM instance in ZStack Cloud, the cloud records the GuestTools version. Note that you can add the **GuestTools** option to **SystemTags**.
 - Format of the **GuestTools** option: `GuestTools::TOOLS_VERSION`. Here, the initial value of `TOOLS_VERSION` is 1.0.0. This value will change as the version of GuestTools is upgraded.
 - Example: `GuestTools::1.0.0`
 - The cloud records the version of the GuestTools ISO installed on a host, compares the version with that in the `/opt/zstack-dvd` directory of the management node, and then decides whether to upgrade the GuestTools ISO.

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
AttachGuestToolsIsoToVmAction action = new AttachGuestToolsIsoToVmAction();
action.uuid = "f58d939e32073aa49acc4897bf81ae45";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
AttachGuestToolsIsoToVmAction.Result res = action.call();
```

Python SDK

```
AttachGuestToolsIsoToVmAction action = AttachGuestToolsIsoToVmAction()
action.uuid = "f58d939e32073aa49acc4897bf81ae45"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
AttachGuestToolsIsoToVmAction.Result res = action.call()
```

5.1.1.101 GetLatestGuestToolsForVm

API Request

URLs

```
GET zstack/v1/vm-instances/{uuid}/latest-guest-tools
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/vm-instances/
f7be56d67fb731ac9e201c69428c6a69/latest-guest-tools
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.7.0
systemTags	List	query	Optional. The system tags.		3.7.0
userTags	List	query	Optional. The user tags.		3.7.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "281ed8f30eff42c4a8d788384b782977",
    "managementNodeUuid": "9fbb4361b1e2466f933558d45746bb59",
    "architecture": "x86_64",
    "hypervisorType": "kvm",
    "version": "1.0.0",
    "createDate": "Oct 9, 2019 7:37:57 PM",
    "lastOpDate": "Oct 9, 2019 7:37:57 PM"
  }
}
```

}

Name	Type	Description	Starting Version
success	boolean	Whether the operation succeeds.	3.7.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.7.0
inventory	GuestToolsInventory	See inventory .	3.7.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.7.0
description	String	The brief description of the error.	3.7.0
details	String	The details about the error.	3.7.0
elaboration	String	The reserved field. Default value: null.	3.7.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.7.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.7.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.7.0
name	String	The resource name.	3.7.0
description	String	The detailed description of the resource.	3.7.0
management NodeUuid	String	The management node UUID.	3.7.0
architecture	String	The architecture.	3.7.0
hypervisorType	String	The hypervisor type.	3.7.0
version	String	The version.	3.7.0
createDate	Timestamp	The creation date.	3.7.0
lastOpDate	Timestamp	The last operation date.	3.7.0

SDK Sample

Java SDK

```
GetLatestGuestToolsForVmAction action = new GetLatestGuestToolsForVmAction();
action.uuid = "f7be56d67fb731ac9e201c69428c6a69";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetLatestGuestToolsForVmAction.Result res = action.call();
```

Python SDK

```
GetLatestGuestToolsForVmAction action = GetLatestGuestToolsForVmAction()
action.uuid = "f7be56d67fb731ac9e201c69428c6a69"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
GetLatestGuestToolsForVmAction.Result res = action.call()
```

5.1.1.102 GetVmGuestToolsInfo

API Request

URLs

```
GET zstack/v1/vm-instances/{uuid}/guest-tools-infos
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/vm-
instances/5ecc83bf3f5033b9b78b4f9406c01f8f/guest-tools-infos
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.7.0
systemTags	List	query	Optional. The system tags.		3.7.0
userTags	List	query	Optional. The user tags.		3.7.0

Note:

- ZStack Cloud records the version of the GuestTools ISO installed in the VM instance, compares the ISO version with that of the host, and then decides whether to upgrade the GuestTools ISO. Note that you can add the **GuestTools** option to **SystemTags**.
 - Format of the **GuestTools** option: `GuestTools::TOOLS_VERSION`. Here, the initial value of `TOOLS_VERSION` is 1.0.0. This value will change as the version of GuestTools is upgraded.
 - Example: `GuestTools::1.0.0`

- Note: This API is used to obtain the version and running status of the GuestTools installed in the VM instance. If the requested information is returned but the VM instance does not have a GuestTools tag, then a GuestTools tag will be created. If the requested information is returned but the returned GuestTools information is different from the current GuestTools tag value of the VM instance, then the tag will be updated.

API Response

Sample Response

```
{
  "version": "1.0.0",
  "status": "Running"
}
```

Name	Type	Description	Starting Version
version	String	The version of the GuestTools.	3.7.0
status	String	The status of the GuestTools.	3.7.0
features	Map	The features that GuestTools supports and the status of the features.	4.2.0
success	boolean	Whether the operation succeeds.	3.7.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.7.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.7.0

Name	Type	Description	Starting Version
description	String	The brief description of the error.	3.7.0
details	String	The details about the error.	3.7.0
elaboration	String	The reserved field. Default value: null.	3.7.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.7.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.7.0

SDK Sample

Java SDK

```
GetVmGuestToolsInfoAction action = new GetVmGuestToolsInfoAction();
action.uuid = "5ecc83bf3f5033b9b78b4f9406c01f8f";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetVmGuestToolsInfoAction.Result res = action.call();
```

Python SDK

```
GetVmGuestToolsInfoAction action = GetVmGuestToolsInfoAction()
action.uuid = "5ecc83bf3f5033b9b78b4f9406c01f8f"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
GetVmGuestToolsInfoAction.Result res = action.call()
```

5.1.1.103 GetVmInstanceFirstBootDevice

API Request

URLs

```
GET zstack/v1/vm-instances/{uuid}/first-boot-device
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/vm-
instances/50d8c8ed7d4737fd99a2e323cefeac81/first-boot-device
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.7.0
systemTags	List	query	Optional. The system tags.		3.7.0
userTags	List	query	Optional. The user tags.		3.7.0

API Response

Sample Response

```
{
  "firstBootDevice": "CdRom"
}
```

Name	Type	Description	Starting Version
firstBootDevice	String	The first boot device of the VM instance.	3.7.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For	3.7.0

Name	Type	Description	Starting Version
		more information, see error .	

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.7.0
description	String	The brief description of the error.	3.7.0
details	String	The details about the error.	3.7.0
elaboration	String	The reserved field. Default value: null.	3.7.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.7.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.7.0

SDK Sample

Java SDK

```
GetVmInstanceFirstBootDeviceAction action = new GetVmInstanceFirstBo
otDeviceAction();
action.uuid = "50d8c8ed7d4737fd99a2e323cefeac81";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetVmInstanceFirstBootDeviceAction.Result res = action.call();
```

Python SDK

```
GetVmInstanceFirstBootDeviceAction action = GetVmInstanceFirstBo
otDeviceAction()
action.uuid = "50d8c8ed7d4737fd99a2e323cefeac81"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
GetVmInstanceFirstBootDeviceAction.Result res = action.call()
```

5.1.1.104 UpdateVmNicDriver

API Request

URLs

```
PUT zstack/vm-instances/{vmInstanceId}/actions?vmNicUuid={vmNicUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateVmNicDriver": {
    "vmNicUuid": "1954794b830e32edbcf17f36344bbd14",
    "driverType": "e1000"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateVmNicDriver":
{"vmNicUuid":"1954794b830e32edbcf17f36344bbd14","driverType":"e1000"}}'
http://localhost:8080/zstack/v1/vm-instances/
ca775a57e8d73a3ca85f490b53647b80/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vmInstanceId	String	url	The VM instance UUID.		3.9.0
vmNicUuid	String	url	The VM NIC UUID.		3.9.0

Name	Type	Location	Description	Optional Value	Starting Version
driverType	String	body (contained in the params structure)	The type of the VM NIC driver.	- virtio - e1000 - rtl8139	3.9.0
systemTags	List	body	Optional. The system tags.		3.9.0
userTags	List	body	Optional. The user tags.		3.9.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "b6af955c36b23be693fca2db0df03737",
    "vmInstanceUuid": "ed3f3ea119883726b1a97ec3cc4b1583",
    "usedIpUuid": "78b119bae906373d825fa7e68faf6a0b",
    "l3NetworkUuid": "307365f47f933bf09ff951cb67b52c5b",
    "ip": "192.168.1.10",
    "mac": "00:0c:29:bd:99:fc",
    "netmask": "255.255.255.0",
    "gateway": "192.168.1.1",
    "driverType": "e1000",
    "deviceId": 0.0
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.9.0
inventory	VmNicInventory	See inventory .	3.9.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error	3.9.0

Name	Type	Description	Starting Version
		. For example, SYS.1000, HOST.1001.	
description	String	The brief description of the error.	3.9.0
details	String	The details about the error.	3.9.0
elaboration	String	The reserved field. Default value: null.	3.9.0

action.driverType = "e1000";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateVmNicDriverAction.Result res = action.call();
```

Python SDK

```
UpdateVmNicDriverAction action = UpdateVmNicDriverAction()
action.vmInstanceUuid = "ca775a57e8d73a3ca85f490b53647b80"
action.vmNicUuid = "1954794b830e32edbcf17f36344bbd14"
action.driverType = "e1000"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
UpdateVmNicDriverAction.Result res = action.call()
```

5.1.1.105 GetVmDeviceAddress

API Request

URLs

```
GET zstack/v1/vm-instances/devices
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/vm-instances/devices?
uuid=a761ac08ca483af4a81d9ed3d9930ef4&resourceTypes=VolumeVO
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
uuid	String	query	The VM UUID.		3.10.0
resourceTypes	List	query	The resource type.	VolumeVO	3.10.0
systemTags	List	query	Optional. The system tags.		3.10.0
userTags	List	query	Optional. The user tags.		3.10.0

API Response

Sample Response

```
{
  "addresses": {
    "VolumeVO": [
      {
        "address": "0000:01:00:0",
        "addressType": "pci",
        "deviceType": "disk",
        "resourceType": "VolumeVO"
      }
    ]
  }
}
```

}

Name	Type	Description	Starting Version
addresses	Map	The device addresses.	3.10.0
success	boolean		3.10.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.10.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.10.0
description	String	The brief description of the error.	3.10.0
details	String	The details about the error.	3.10.0
elaboration	String	The reserved field. Default value: null.	3.10.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.10.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.10.0

SDK Sample

Java SDK

```
GetVmDeviceAddressAction action = new GetVmDeviceAddressAction();
action.uuid = "a761ac08ca483af4a81d9ed3d9930ef4";
```

```
action.resourceTypes = asList("VolumeV0");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetVmDeviceAddressAction.Result res = action.call();
```

Python SDK

```
GetVmDeviceAddressAction action = GetVmDeviceAddressAction()
action.uuid = "a761ac08ca483af4a81d9ed3d9930ef4"
action.resourceTypes = [VolumeV0]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetVmDeviceAddressAction.Result res = action.call()
```

5.1.1.106 GetVmsCapabilities

API Request

URLs

```
POST zstack/v1/vm-instances/capabilities
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "vmUuids": [
      "86db798b3a0530b187380da6c9c58190"
    ]
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"vmUuids":
["86db798b3a0530b187380da6c9c58190"]}}' http://localhost:8080/zstack/
v1/vm-instances/capabilities
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
vmUuids	String	body(contained in the params structure)	The UUID of the VM instance to be queried.		4.0.0
systemTags	List	body	Optional. The system tags.		4.0.0
userTags	List	body	Optional. The user tags.		4.0.0

API Response

Sample Response

```
{
  "vmsCaps": {
    "68e8ed0735333faab95816b3e8596cea": {
      "supportLiveMigration": true,
      "supportVolumeMigration": true,
      "supportReimage": true,
      "supportMemorySnapshot": false
    }
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.0.0
vmsCaps	Map	For more information, see vmsCaps .	4.0.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error	4.0.0

Name	Type	Description	Starting Version
		. For example, SYS.1000, HOST.1001.	
description	String	The brief description of the error.	4.0.0
details	String	The details about the error.	4.0.0
elaboration	String	The reserved field. Default value: null.	4.0.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.0.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.0.0

#vmsCaps

Name	Type	Description	Starting Version
supportLiveMigration	boolean		4.0.0
supportVolumeMigration	boolean		4.0.0
supportReimage	boolean		4.0.0
supportMemorySnapshot	boolean		4.0.0

SDK Sample

Java SDK

```
GetVmsCapabilitiesAction action = new GetVmsCapabilitiesAction();
action.vmUuids = asList("86db798b3a0530b187380da6c9c58190");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetVmsCapabilitiesAction.Result res = action.call();
```

Python SDK

```
GetVmsCapabilitiesAction action = GetVmsCapabilitiesAction()
action.vmUuids = [86db798b3a0530b187380da6c9c58190]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
GetVmsCapabilitiesAction.Result res = action.call()
```

5.1.1.107 SetVmNuma

API Request

URLs

```
PUT zstack/v1/vm-instances/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "setVmNuma": {
    "enable": true
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"setVmNuma":{"enable":true}}'
http://localhost:8080/zstack/v1/vm-instances/
f523cb5736b630acb643dda6d31be5a0/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The VM UUID.		4.3.12
enable	boolean	body (contained in the setVmNum structure)body	Specifies whether to enable vNUMA for the VM instance.		4.3.12

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	body	Optional. The system tags.		4.3.12
userTags	List	body	Optional. The user tags.		4.3.12

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
SetVmNumaAction action = new SetVmNumaAction();
action.uuid = "f523cb5736b630acb643dda6d31be5a0";
action.enable = true;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
SetVmNumaAction.Result res = action.call();
```

Python SDK

```
SetVmNumaAction action = SetVmNumaAction()
action.uuid = "f523cb5736b630acb643dda6d31be5a0"
action.enable = true
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
SetVmNumaAction.Result res = action.call()
```

5.1.1.108 GetVmNuma

API Request

URLs

```
GET zstack/v1/vm-instances/{uuid}/vnuma
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/vm-
instances/1dd7af3a42403a1d9b3734f5ed573103/vnuma
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The VM UUID.		4.3.12
systemTags	List	body	Optional. The system tags.		4.3.12
userTags	List	body	Optional. The user tags.		4.3.12

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "enable": true
}
```

Name	Type	Description	Starting Version
enable	boolean	Indicates whether vNUMA is enabled for the VM instance.	4.3.12

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.3.12

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	4.3.12
description	String	The brief description of the error.	4.3.12
details	String	The details about the error.	4.3.12
elaboration	String	The reserved field. Default value: null.	4.3.12
opaque	LinkedHashMap	The reserved field. Default value: null.	4.3.12
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.3.12

SDK Sample

Java SDK

```
GetVmNumaAction action = new GetVmNumaAction();
action.uuid = "1dd7af3a42403a1d9b3734f5ed573103";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
GetVmNumaAction.Result res = action.call();
```

Python SDK

```
GetVmNumaAction action = GetVmNumaAction()
action.uuid = "1dd7af3a42403a1d9b3734f5ed573103"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetVmNumaAction.Result res = action.call()
```

5.1.1.109 GetVmvNUMATopology

API Request

URLs

```
GET zstack/v1/vm-instances/{uuid}/vnuma-topology
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/vm-
instances/21529457e42c30f0a9b2a137915a0b28/vnuma-topology
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The VM UUID.		4.3.12

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "hostUuid": "7fd86bbe6ca94a8d810aa1d33e29932c",
  "topology": [
    {
      "CPUsID": ["0", "1", "2", "3"],
      "distance": ["10", "21"],
      "nodeID": 0,
      "memSize": 1024,
      "phyNodeID": 0
    },
    {
      "CPUsID": ["4", "5", "6", "7"],
      "distance": ["21", "10"],

```

```

        "nodeID": 1,
        "memSize": 2048,
        "phyNodeID": 1
    },
    "name": "vm0",
    "uuid": "71b30db8bca34e9191ed09bff2990e80"
}

```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.3.12
name	String	The VM name.	4.3.12
uuid	String	The VM UUID.	4.3.12
hostUuid	String	The host UUID.	4.3.12
topology	array[json]	The vNUMA topology. For more information, see topology .	4.3.12

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.3.12
description	String	The brief description of the error.	4.3.12
details	String	The details about the error.	4.3.12
elaboration	String	The reserved field. Default value: null.	4.3.12
opaque	LinkedHashMap	The reserved field. Default value: null.	4.3.12
cause	ErrorCode	The root error, which is the associated root	4.3.12

Name	Type	Description	Starting Version
		cause of the current error. If no root error exists, this parameter is null.	

#topology

Name	Type	Description	Starting Version
nodeID	int	The vNUMA node ID.	4.3.12
CPUsID	array[string]	The vCPU IDs in the vNUMA node.	4.3.12
phyNodeID	int	The pNUMA node ID.	4.3.12
distance	array[string]	The distance information of the vNUMA node.	4.3.12
memSize	long	The memory size of the vNUMA node, in the unit of B.	4.3.12

SDK Sample

Java SDK

```
GetVmvNUMATopologyAction action = new GetVmvNUMATopologyAction()
action.uuid = "ff6d905e75d63e18ab0a9fc2ac14951c"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetVmvNUMATopologyAction.Result res = action.call()
```

Python SDK

```
GetVmvNUMATopologyAction action = new GetVmvNUMATopologyAction()
action.uuid = "ff6d905e75d63e18ab0a9fc2ac14951c"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
GetVmvmNUMATopologyAction.Result res = action.call()
```

5.1.1.110 SetVmEmulatorPinning

API Request

URLs

```
PUT zstack/v1/vm-instances/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "setVmEmulatorPinning": {
    "emulatorPinning": "1-4"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"setVmEmulatorPinning":{"emulatorPinning":"1-4"}}'
http://localhost:8080/zstack/v1/vm-instances/
f523cb5736b630acb643dda6d31be5a0/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		4.3.12
emulatorPinning	String	body(contained in the setVmEmulatorPinning structure)	The emulator pinning. Format: ([^] ?(\d+)(-\d+)?)?.		4.3.12

Name	Type	Location	Description	Optional Value	Starting Version
			For example: (0-1,16)		
systemTags	List	body	Optional. The system tags.		4.3.12
userTags	List	body	Optional. The user tags.		4.3.12

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
SetVmEmulatorPinningAction action = new SetVmEmulatorPinningAction();
action.uuid = "f523cb5736b630acb643dda6d31be5a0";
action.enable = true;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
SetVmEmulatorPinningAction.Result res = action.call();
```

Python SDK

```
SetVmEmulatorPinningAction action = SetVmEmulatorPinningAction()
action.uuid = "f523cb5736b630acb643dda6d31be5a0"
action.enable = true
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
SetVmEmulatorPinningAction.Result res = action.call()
```

5.1.1.111 GetVmEmulatorPinning

API Request

URLs

```
GET zstack/v1/vm-instances/{uuid}/emulator-pinning
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/vm-
instances/1dd7af3a42403a1d9b3734f5ed573103/emulator-pinning
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		4.3.12
systemTags	List	body	Optional. The system tags.		4.3.12
userTags	List	body	Optional. The user tags.		4.3.12

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{"emulatorPinning": "12,13"}
```

Name	Type	Description	Starting Version
emulatorPinning	String	The emulator pinning	4.3.12
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For	4.3.12

Name	Type	Description	Starting Version
		more information, see error .	

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.3.12
description	String	The brief description of the error.	4.3.12
details	String	The details about the error.	4.3.12
elaboration	String	The reserved field. Default value: null.	4.3.12
opaque	LinkedHashMap	The reserved field. Default value: null.	4.3.12
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.3.12

SDK Sample

Java SDK

```
GetVmEmulatorPinningAction action = new GetVmEmulatorPinningAction();
action.uuid = "1dd7af3a42403a1d9b3734f5ed573103";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetVmEmulatorPinningAction.Result res = action.call();
```

Python SDK

```
GetVmEmulatorPinningAction action = GetVmEmulatorPinningAction()
action.uuid = "1dd7af3a42403a1d9b3734f5ed573103"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
GetVmEmulatorPinningAction.Result res = action.call()
```

5.1.1.112 QueryVmSchedHistory

API Requests

URLs

```
GET zstack//v1/vm/sched-history
```

```
GET zstack//v1/vm/sched-history/{vmInstanceUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Samples

```
curl -H "Content-Type: application/json; charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \

action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryVmSchedHistoryAction.Result res = action.call()
```

5.1.1.113 FlattenVmInstance

API Request

URLs

```
PUT zstack/v1/vm-instances/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "flattenVmInstance": {
    "full": true,
    "dryRun": false
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"flattenVmInstance":{"full":true,"dryRun":false}}'
http://localhost:8080/zstack/v1/vm-instances/
cb728238f38a3adcadac91425f9534b3/actions
```

Request Parameters

Name	Typ	Location	Description	Valid Value	Starting Version
uuid	String	url	The resource UUID.		4.7.0
full	boolean	body (contained in the flattenVmInstance structure)	Optional. Flatten all volumes attached to the VM instance.		4.7.0
dryRun	boolean	body (contained in the flattenVmInstance structure)	Optional. Trial . Predicate the data usage.		4.7.0
systemTags	List	body	Optional. The system tags.		4.7.0
userTags	List	body	Optional. The user tags.		4.7.0

description	String	The resource description.	4.7.0
createDate	Timestamp	The creation date.	4.7.0

Name	Type	Description	Starting Version
lastOpDate	Timestamp	The last operation date.	4.7.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	4.7.0
description	String	The brief description of the error.	4.7.0
details	String	The details about the error.	4.7.0
elaboration	String	The reserved field. Default value: null.	4.7.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.7.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.7.0

SDK Sample

Java SDK

```

FlattenVmInstanceAction action = new FlattenVmInstanceAction();
action.uuid = "cb728238f38a3adcadac91425f9534b3";
action.full = true;
action.dryRun = false;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
FlattenVmInstanceAction.Result res = action.call();

```

Python SDK

```

FlattenVmInstanceAction action = FlattenVmInstanceAction()
action.uuid = "cb728238f38a3adcadac91425f9534b3"
action.full = true

```

```
action.dryRun = false
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
FlattenVmInstanceAction.Result res = action.call()
```

5.1.1.114 ExecuteGuestVmCommand

API Request

URLs

```
PUT zstack/v1/vm-instances/commands/exec
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "vmInstanceUuid": "af89f31332ac3457874450311affadc2",
    "platform": "Linux",
    "command": "echo helloworld",
    "commandTimeout": 20
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"vmInstanceUuid": "af89f31332ac3457874450311affadc2", "platform": "Linux", "command":
"helloworld", "commandTimeout": 20}}' http://localhost:8080/zstack/v1/
vm-instances/commands/exec
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
vmInstance Uuid	String	body (contained in	The VM instance UUID		5.2.0

Name	Type	Location	Description	Valid Value	Starting Version
		the params structure)			
platform	String	body (contained in the params structure)	The platform.	- Windows - Linux	5.2.0
command	String	body (contained in the params structure)	The command .		5.2.0
commandTimeout	Integer	body (contained in the params structure)	Optional. The timeout period .		5.2.0
systemTags	List	body	Optional. The system tags.		5.2.0
userTags	List	body	Optional. The user tags.		5.2.0

API Response

Sample Response

```
{
  "stream": "standardStream: hello world, errorStream: 1/0 is not a goodScript",
  "vmInstance": {
    "uuid": "fc022ba201c135d8809c5e02bf6bf156",
    "name": "vm_1"
  }
}
```

Name	Type	Description	Starting Version
success	boolean		5.2.0
stream	String	The stream.	5.2.0
vmInstance	VmInstanceInventory	See vmInstance	5.2.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For	5.2.0

SDK Sample

Java SDK

```
ExecuteGuestVmCommandAction action = new ExecuteGuestVmCommandAction
();
action.vmInstanceId = "af89f31332ac3457874450311affadc2";
action.platform = "Linux";
action.command = "echo helloworld";
action.commandTimeout = 20;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
ExecuteGuestVmCommandAction.Result res = action.call();
```

Python SDK

```
ExecuteGuestVmCommandAction action = ExecuteGuestVmCommandAction()
action.vmInstanceId = "af89f31332ac3457874450311affadc2"
action.platform = "Linux"
action.command = "echo helloworld"
action.commandTimeout = 20
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
ExecuteGuestVmCommandAction.Result res = action.call()
```

5.1.1.115 UploadFileToVm

API Request

URLs

```
POST zstack/v1/upload-file
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "vmInstanceUuids": [
      "358310f6b6b23b9f9bdcf8d34b03719f"
    ],
    "fileContent": "ZWNobyBoZWxsb3dvcmxkCg\u003d\u003d",
    "remotePath": "/var/lib/zstack/uploadfile"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"vmInstanceUuids":
["358310f6b6b23b9f9bdcf8d34b03719f"],"fileContent":"ZWNobyBoZWxsb3dvcmxkCg==", "remotePath":"/var/lib/zstack/uploadfile"}}' http://localhost:8080/zstack/v1/upload-file
```

Request Parameters

Name	Type	Location	Description	Valid Values	Starting Version
vmInstanceUuids	List	body (contained in the params structure)	The VM instances that the files are uploaded to.		5.2.0

Name	Type	Location	Description	Valid Values	Starting Version
fileContent	String	body (contained in the params structure)	The file content which is encoded using Base64.		5.2.0
remotePath	String	body (contained in the params structure)	The absolute path that the files are uploaded to . The path contains the file name.		5.2.0
systemTags	List	body	Optional. The system tags.		5.2.0
userTags	List	body	Optional. The user tags.		5.2.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
UploadFileToVmAction action = new UploadFileToVmAction();
action.vmInstanceUuids = asList("358310f6b6b23b9f9bdcf8d34b03719f");
action.fileContent = "ZWNobyBoZWxsb3dvcmxkCg==";
action.remotePath = "/var/lib/zstack/uploadfile";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UploadFileToVmAction.Result res = action.call();
```

Python SDK

```
UploadFileToVmAction action = UploadFileToVmAction()
action.vmInstanceUuids = [358310f6b6b23b9f9bdcf8d34b03719f]
action.fileContent = "ZWNobyBoZWxsb3dvcmxkCg=="
```

```
action.remotePath = "/var/lib/zstack/uploadfile"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UploadFileToVmAction.Result res = action.call()
```

5.1.2 Volume Operations

5.1.2.1 CreateDataVolume

API Request

URLs

```
POST zstack/v1/volumes/data
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "test-volume",
    "description": "test-data-volume",
    "diskOfferingUuid": "d8732f8e173543ef85a0c2066559ef94",
    "primaryStorageUuid": "ad21b7c7f4ca4d86b348a415347ab1b5",
    "resourceUuid": "e3c9ebe5b5144dd4ba791c5f2959726a"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"name":"test-volume","description":"test-data-volume","diskOfferingUuid":"d88594833a393e119c6fc5a8aa2ad08f","primaryStorageUuid":"d88594833a393e119c6fc5a8aa2ad08f"},"systemTags":[]}' \
http://localhost:8080/zstack/v1/volumes/data
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The volume name.		0.6
description	String	body (contained in the params structure)	Optional. The detailed description of the volume.		0.6
diskOfferingUuid	String	body (contained in the params structure)	The disk offering UUID.		0.6
primaryStorageUuid	String	body (contained in the params structure)	Optional. The primary storage UUID.		0.6
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		0.6
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID list.		3.4.0
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

**Note:**

- When you create a data volume in ZStack Cloud, you can specify the volume provisioning strategy by adding the **volumeProvisioningStrategy** option to **SystemTags**. The SystemTag is passed by using the **dataVolumeSystemTags** parameter.
 - Format of the **volumeProvisioningStrategy** option: `volumeProvisioningStrategy::ThinProvisioning`, `volumeProvisioningStrategy::ThickProvisioning`

- Example: `volumeProvisioningStrategy::ThinProvisioning`, `volumeProvisioningStrategy::ThickProvisioning`

5.1.2.2 DeleteDataVolume

API Request

URLs

```
DELETE zstack/v1/volumes/{uuid}?deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
```

```
-H "Authorization: OAuth 92d7ee354b4e4ed19aea6a7ebb172096" \
-X DELETE http://localhost:8080/zstack/v1/
volumes/3102474ff9514720b79ff3719ab6c8e5?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The volume UUID.		0.6
deleteMode	String	body	Optional. The delete mode . Options: Permissive Enforcing. Default mode: Permissive.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteDataVolumeAction action = new DeleteDataVolumeAction();
action.uuid = "0c9ca7222d914c628d60f5f38b8a5e1e";
action.deleteMode = "Permissive";
action.sessionId = "6b164d54219d4ef8a287fb4937333d54";
DeleteDataVolumeAction.Result res = action.call();
```

Python SDK

```
DeleteDataVolumeAction action = DeleteDataVolumeAction()
```

```

action.uuid = "ba73b65a66ce433790526c3ee146db3b"
action.deleteMode = "Permissive"
action.sessionId = "fce147bb4ab540448ad4f1798e90f3f9"
DeleteDataVolumeAction.Result res = action.call()

```

5.1.2.3 ExpungeDataVolume

API Request

URLs

```
PUT zstack/v1/volumes/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```

{
  "expungeDataVolume": {},
  "systemTags": [],
  "userTags": []
}

```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"expungeDataVolume":{}}' \
http://localhost:8080/zstack/v1/
volumes/6dd47cca96f238c899aacd61867db520/actions

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The volume UUID.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
ExpungeDataVolumeAction action = new ExpungeDataVolumeAction();
action.uuid = "347edf4db9e9482a895f7aab3d7f4c26";
action.sessionId = "cc3787426fdd480f8ae6ad656b37b909";
ExpungeDataVolumeAction.Result res = action.call();
```

Python SDK

```
ExpungeDataVolumeAction action = ExpungeDataVolumeAction()
action.uuid = "2dc23f228294cab80bcd90e0024dc89"
action.sessionId = "86af19d2bda54fa6bee0204b8e33d4de"
ExpungeDataVolumeAction.Result res = action.call()
```

5.1.2.4 RecoverDataVolume

API Request

URLs

```
PUT zstack/v1/volumes/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "recoverDataVolume": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"recoverDataVolume":{}}' \
http://localhost:8080/zstack/v1/
volumes/9f5090fc93ff33e283e0ff3c99fad1e2/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The volume UUID.		0.6

SDK Sample

Java SDK

```
RecoverDataVolumeAction action = new RecoverDataVolumeAction();
action.uuid = "16bc12c40c2242189a9c80a0e908dc21";
action.sessionId = "e444803b7dd047238dca620217929bff";
RecoverDataVolumeAction.Result res = action.call();
```

Python SDK

```
RecoverDataVolumeAction action = RecoverDataVolumeAction()
action.uuid = "d5bd95c8ce764a72b77510f17a2eb3a4"
action.sessionId = "ba4360074009447184682979d1c0fd26"
```

```
RecoverDataVolumeAction.Result res = action.call()
```

5.1.2.5 ChangeVolumeState

API Request

URLs

```
PUT zstack/v1/volumes/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeVolumeState": {
    "stateEvent": "enable"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"changeVolumeState":{"stateEvent":"enable"}}' \
http://localhost:8080/zstack/v1/
volumes/97fa26ec14d9328c9cfada75e3c0307b/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The volume UUID.		0.6
stateEvent	String	body (contained in the changeVolu	Whether to enable or disable the volume.	- enable - disable	0.6

Name	Type	Location	Description	Optional Value	Starting Version
		meState structure)			
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```

SDK Sample

Java SDK

```
ChangeVolumeStateAction action = new ChangeVolumeStateAction();
action.uuid = "67553476ee8643f49ac88304822acd7f";
action.stateEvent = "enable";
action.sessionId = "dc32c1bb220843efb1e3b27b9ca95695";
ChangeVolumeStateAction.Result res = action.call();
```

Python SDK

```
ChangeVolumeStateAction action = ChangeVolumeStateAction()
action.uuid = "d18b8dc1ba91461f995e6904bd6a7fc4"
action.stateEvent = "enable"
action.sessionId = "72301e2f3cf94e57adf10f56a08d1d12"
```

```
ChangeVolumeStateAction.Result res = action.call()
```

5.1.2.6 CreateDataVolumeFromVolumeTemplate

API Request

URLs

```
POST zstack/v1/volumes/data/from/data-volume-templates/{imageUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "data-volume-1",
    "description": "dataVolume-from-volume-template",
    "primaryStorageUuid": "faf07bfbec0944499d566345f0de383e",
    "hostUuid": "c0411ea2b3d949fab31239d200a83faf"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"name":"data-volume-1","description":"dataVolume-from-volume-template","primaryStorageUuid":"849de664b4db321f8eeef65a1aa757c7","hostUuid":"0de664b4db321f8eeef65a1aa757c7"},"systemTags":[],"userTags":[]}' \
http://localhost:8080/zstack/v1/volumes/data/from/data-volume-templates/285f4a49e7403d2dad9545b42c33b837
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
imageUuid	String	url	The image UUID.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The volume name.		0.6
description	String	body (contained in the params structure)	Optional. The detailed description of the volume.		0.6
primaryStorageUuid	String	body (contained in the params structure)	The primary storage UUID.		0.6
hostUuid	String	body (contained in the params structure)	Optional. The host UUID.		0.6
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

**Note:**

- When you create a volume from an image in ZStack Cloud, you can create a shared volume by adding the **shareable** option to **SystemTags**. The SystemTag is passed by using the **shareable** parameter. Note that you will create a shared volume if you add this SystemTag. If you do not add this SystemTag, you will create a normal volume.

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6

Name	Type	Description	Starting Version
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventories

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
name	String	The resource name.	0.6
description	String	The detailed description of the resource.	0.6
primaryStorageUuid	String	The primary storage UUID.	0.6
vmInstanceUuid	String	The VM instance UUID.	0.6
diskOfferingUuid	String	The disk offering UUID.	0.6
rootImageUuid	String		0.6
installPath	String		0.6
type	String		0.6
format	String		0.6
size	Long		0.6
actualSize	Long		0.6
deviceId	Integer		0.6
state	String		0.6

Name	Type	Description	Starting Version
status	String		0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6
isShareable	Boolean		0.6

SDK Sample

Java SDK

```
QueryVolumeAction action = new QueryVolumeAction();
action.conditions = asList();
action.sessionId = "a6c77f7c77dd425e98f3089363725c06";
QueryVolumeAction.Result res = action.call();
```

Python SDK

```
QueryVolumeAction action = QueryVolumeAction()
action.conditions = []
action.sessionId = "8e464fe1562b4fcc80b02596f455e6a8"
QueryVolumeAction.Result res = action.call()
```

5.1.2.9 GetVolumeFormat

API Request

URLs

```
GET zstack/v1/volumes/formats
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 91c86306f8fd45ba9af34c549baa8052" \
-X GET http://localhost:8080/zstack/v1/volumes/formats
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	query	Optional. The system tags.		0.6
userTags	List	query	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "formats": [
    {
      "format": "iso",
      "masterHypervisorType": "KVM",
      "supportingHypervisorTypes": [
        "ESX",
        "KVM"
      ]
    }
  ]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
formats	List	See formats .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6

Name	Type	Description	Starting Version
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#formats

Name	Type	Description	Starting Version
format	String	The volume format.	0.6
masterHypervisorType	String	The default hypervisor type.	0.6
supportingHypervisorTypes	List	The list of supported hypervisor types.	0.6

SDK Sample

Java SDK

```
GetVolumeFormatAction action = new GetVolumeFormatAction();
action.sessionId = "6fda4c2362614bec9ec42a2eb8f4a4b0";
GetVolumeFormatAction.Result res = action.call();
```

Python SDK

```
GetVolumeFormatAction action = GetVolumeFormatAction()
action.sessionId = "a5cd7896806e4717a609899d22a90594"
```

```
GetVolumeFormatAction.Result res = action.call()
```

5.1.2.10 GetVolumeCapabilities

API Request

URLs

```
GET zstack/v1/volumes/{uuid}/capabilities
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 202bde8c03d94942b052da20b48a2301" \
-X GET http://localhost:8080/zstack/v1/
volumes/96646576bd1c44ac845810374ca41c58/capabilities
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The volume UUID.		0.6
systemTags	List	query	Optional. The system tags.		0.6
userTags	List	query	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "capabilities": {
    "MigrationToOtherPrimaryStorage": true,
    "MigrationInCurrentPrimaryStorage": true
  }
}
```

Name	Type	Description	Starting Version
capabilities	Map	The capabilities supported by the volume.	0.6

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

SDK Sample

Java SDK

```
GetVolumeCapabilitiesAction action = new GetVolumeCapabilitiesAction
();
action.uuid = "23c96138a1874aeebcd082be9b21f905";
action.sessionId = "b8980f940bad4558947437d211262e2f";
```

```
GetVolumeCapabilitiesAction.Result res = action.call();
```

Python SDK

```
GetVolumeCapabilitiesAction action = GetVolumeCapabilitiesAction()
action.uuid = "b645da1aa3ed4771b0860d01144929b6"
action.sessionId = "277436d4a8f54942a496ca64b2d7f3f0"
GetVolumeCapabilitiesAction.Result res = action.call()
```

5.1.2.11 SyncVolumeSize

API Request

URLs

```
PUT zstack/v1/volumes/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "syncVolumeSize": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"syncVolumeSize":{}}' \
http://localhost:8080/zstack/v1/
volumes/017a6c821b3433c594285712cd7e69f4/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The volume UUID.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "d0cd0413d1b241fca524322b56f4687d",
    "name": "test-volume",

action.sessionId = "48363f37efe6484abfff927059cedae3"  
SyncVolumeSizeAction.Result res = action.call()
```

5.1.2.12 BatchSyncVolumeSize

API Request

URLs

```
POST zstack/v1/volumes/batch-sync-volumes
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \  
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \  

```

```
-X POST http://localhost:8080/zstack/v1/volumes/batch-sync-volumes
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
clusterUuid	String	body	The cluster UUID.		4.5.3
systemTags (可选)	List	body	The system tag.		4.5.3
userTags (可选)	List	body	The user tag.		4.5.3

API Response

Sample Response

```
{
  "failCount": 3,
  "successCount": 3
}
```

Name	Type	Description	Starting Version
failCount	int	The failure count.	4.5.3
successCount	int	The success count.	4.5.3
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error	4.5.3

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	4.5.3
description	String	The brief description of the error.	4.5.3

Name	Type	Description	Starting Version
details	String	The details about the error.	4.5.3
elaboration	String	The reserved field. Default value: null.	4.5.3
opaque	LinkedHashMap	The reserved field. Default value: null.	4.5.3
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.5.3

SDK Sample

Java SDK

```
BatchSyncVolumeSizeAction action = new BatchSyncVolumeSizeAction();
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
action.clusterUuid = "5hs8kc3m867kg4x46k8l04dv461vps9e";
BatchSyncVolumeSizeAction.Result res = action.call();
```

Python SDK

```
BatchSyncVolumeSizeAction action = BatchSyncVolumeSizeAction()
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
action.clusterUuid = "5hs8kc3m867kg4x46k8l04dv461vps9e"
BatchSyncVolumeSizeAction.Result res = action.call()
```

5.1.2.13 ResizeRootVolume

API Request

URLs

```
PUT zstack/v1/volumes/resize/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "resizeRootVolume": {
    "size": 1.0E7
  }
}
```

```

    },
    "systemTags": [],
    "userTags": []
  }

```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"resizeRootVolume":{"size":1.0E7}}' \
http://localhost:8080/zstack/v1/volumes/
resize/16a052d270983392bd2824c06a44253f/actions

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.2
size	long	body (contained in the resizeRootVolume structure)	The new size.		2.2
systemTags	List	body	Optional. The system tags.		2.2
userTags	List	body	Optional. The user tags.		2.2

API Response**Sample Response**

isShareable	Boolean		0.6

SDK Sample

Java SDK

```
UpdateVolumeAction action = new UpdateVolumeAction();
action.uuid = "cebcb28540d9474ebf0be79fc9c7efe4";
action.name = "volume-1";
action.description = "data-volume";
action.sessionId = "e5e68d56602441d187139189dce441f7";
UpdateVolumeAction.Result res = action.call();
```

Python SDK

```
UpdateVolumeAction action = UpdateVolumeAction()
action.uuid = "d429120df78e4b7290fd4f50adfa2f2e"
action.name = "volume-1"
action.description = "data-volume"
action.sessionId = "31a278c3b4024dc48b952196c0ae34a0"
```

```
UpdateVolumeAction.Result res = action.call()
```

5.1.2.16 SetVolumeQoS

API Request

URLs

```
POST zstack/v1/volumes/{uuid}/QoS
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "setVolumeQos": {
    "totalBandwidth": 10000.0,
    "totalIOPS": 1000.0
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"setVolumeQos":
{"totalBandwidth":10000.0,"totalIOPS":1000.0}}' http://
localhost:8080/zstack/v1/volumes/384f99ce0b7a307685856b23f75c5167/
actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The volume UUID.		0.6
volumeBand width	Long	body (contained in the params structure)	The volume bandwidth.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
mode	String	body (contained in the setVolumeQos structure)	Optional. The mode.	- total - read - write	3.1.0
readBandwidth	Long	body (contained in the setVolumeQos structure)			4.4.0
writeBandwidth	Long	body (contained in the setVolumeQos structure)			4.4.0
totalBandwidth	Long	body (contained in the setVolumeQos structure)			4.4.0
readIOPS	Long	body (contained in the setVolumeQos structure)			4.4.0
writeIOPS	Long	body (contained in the setVolumeQos structure)			4.4.0
totalIOPS	Long	body (contained in the setVolumeQos structure)	Optional.		4.4.0
systemTags	List	body	Optional. The system tags.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
userTags	List	body	Optional. The user tags.		0.6

**Note:**

- ZStack Cloud allows you to set the QoS read bandwidth for a volume by adding the **volumeReadBandwidth** option to **SystemTags**.
 - Format of the **volumeReadBandwidth** option: `volumeReadBandwidth::xxx`. Here, `xxx` is the read bandwidth.
 - Example: `volumeReadBandwidth::20971520`
- ZStack Cloud allows you to set the QoS write bandwidth for a volume by adding the **volumeWriteBandwidth** option to **SystemTags**.
 - Format of the **volumeWriteBandwidth** option: `volumewriteBandwidth::xxx`. Here, `xxx` is the write bandwidth.
 - Example: `vvolumewriteBandwidth::20971520`

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
SetVolumeQoSAction action = new SetVolumeQoSAction();
action.uuid = "ac4fdd09c5884f58a5b38b805b5ddb78";
action.mode = "total";
action.volumeBandwidth = 10000.0;
action.sessionId = "aeec637635af476b94356f4f8fe714be";
```

```
SetVolumeQoSAction.Result res = action.call();
```

Python SDK

```
SetVolumeQoSAction action = SetVolumeQoSAction()
action.uuid = "26d462d809b54d52b2814bbf1302f305"
action.mode = "total"
action.volumeBandwidth = 10000.0
action.sessionId = "eb791fa4bdfb4be28ff279651cde78f9"
SetVolumeQoSAction.Result res = action.call()
```

5.1.2.17 GetVolumeQoS

API Request

URLs

```
GET zstack/v1/volumes/{uuid}/qos
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/
volumes/66adb238cf70369089b3da287e6633bb/qos
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The volume UUID.		0.6
forceSync	Boolean	body	Optional. Whether to synchronize the data on the host.		3.3.0
systemTags	List	query	Optional.		0.6
userTags	List	query	Optional.		0.6

Note:

- ZStack Cloud allows you to obtain the QoS read bandwidth of a volume by adding the **volumeReadBandwidth** option to **SystemTags**.
 - Format of the **volumeReadBandwidth** option: `volumeReadBandwidth::xxx`. Here, xxx is the read bandwidth.
 - Example: `volumeReadBandwidth::20971520`
- ZStack Cloud allows you to obtain the QoS write bandwidth of a volume by adding the **volumeWriteBandwidth** option to **SystemTags**.
 - Format of the **volumeWriteBandwidth** option: `volumeWriteBandwidth::xxx`. Here, xxx is the write bandwidth.
 - Example: `volumeWriteBandwidth::20971520`

API Response

Sample Response

```
{
  "volumeUuid": "1dc9ff4cedae33eb84651468db5734ae",
  "volumeBandwidth": 100000.0,
  "volumeBandwidthRead": -1.0,
  "volumeBandwidthWrite": -1.0,
  "iopsTotal": -1.0,
  "iopsRead": 10000.0,
  "iopsWrite": 10000.0,
  "volumeBandwidthUpthreshold": 200000.0,
  "volumeBandwidthReadUpthreshold": -1.0,
  "volumeBandwidthWriteUpthreshold": -1.0,
  "iopsTotalUpthreshold": -1.0,
  "iopsReadUpthreshold": 20000.0,
  "iopsWriteUpthreshold": 15000.0
}
```

Name	Type	Description	Starting Version
volumeUuid	String	The volume UUID.	3.10
volumeBandwidth	long	The volume bandwidth . Default value: -1.	0.6
volumeBandwidthRead	long	The volume read bandwidth. Default value: -1.	3.10
volumeBandwidthWrite	long	The volume write bandwidth. Default value: -1.	3.10
volumeBandwidthUpthreshold	long	The volume bandwidth . Default value: -1.	3.10

Name	Type	Description	Starting Version
volumeBand widthReadUpthreshold	long	The maximum volume read bandwidth. Default value: -1.	3.10
volumeBand widthWriteUpthreshold	long	The maximum volume write bandwidth. Default value: -1.	3.10
iopsTotalUpthreshold	long	The volume IOPS. Default value: -1. This value indicates that the volume IOPS is unlimited.	4.4.0
iopsReadUpthreshold	long	The read IOPS of a volume. Default value: -1. This value indicates that the read IOPS is unlimited.	4.4.0
iopsWriteUpthreshold	long	The write IOPS of a volume. Default value: -1. This value indicates that the write IOPS is unlimited.	4.4.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6

Name	Type	Description	Starting Version
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

SDK Sample

Java SDK

```
GetVolumeQosAction action = new GetVolumeQosAction();
action.uuid = "66adb238cf70369089b3da287e6633bb";
action.forceSync = false;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetVolumeQosAction.Result res = action.call();
```

Python SDK

```
GetVolumeQosAction action = GetVolumeQosAction()
action.uuid = "66adb238cf70369089b3da287e6633bb"
action.forceSync = false
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetVolumeQosAction.Result res = action.call()
```

5.1.2.18 DeleteVolumeQos

API Request

URLs

```
DELETE zstack/v1/volumes/{uuid}/qos
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
```

```
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/volumes/
f468b0dd61c538b0bbe85327f7deadcd/qos?
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The volume UUID.		0.6
mode	String	body	Optional. The mode.	- total - read - write - all - overwrite	4.4.0
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

Note:

- ZStack Cloud allows you to delete the QoS read bandwidth of a volume by adding the **volumeReadBandwidth** option to **SystemTags**.
 - Format of the **volumeReadBandwidth** option: `volumeReadBandwidth::xxx`. Here, `xxx` is the read bandwidth.
 - Example: `volumeReadBandwidth::20971520`
- ZStack Cloud allows you to delete the QoS read bandwidth of a volume by adding the **volumeWriteBandwidth** option to **SystemTags**.
 - Format of the **volumeWriteBandwidth** option: `volumewriteBandwidth::xxx`. Here, `xxx` is the write bandwidth.
 - Example: `vvolumewriteBandwidth::20971520`

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
```

```
"error": {
  "code": "SYS.1001",
  "description": "A message or a operation timeout",
  "details": "Create VM on KVM timeout after 300s"
}
```

SDK Sample

Java SDK

```
DeleteVolumeQosAction action = new DeleteVolumeQosAction();
action.uuid = "f468b0dd61c538b0bbe85327f7deadcd";
action.mode = "total";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteVolumeQosAction.Result res = action.call();
```

Python SDK

```
DeleteVolumeQosAction action = DeleteVolumeQosAction()
action.uuid = "f468b0dd61c538b0bbe85327f7deadcd"
action.mode = "total"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteVolumeQosAction.Result res = action.call()
```

5.1.2.19 GetVolumeloThreadPin

API Request

URLs

```
GET zstack/v1/volumes/{uuid}/io-thread-pin
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/
volumes/93150452524b3b548cc597c8405fda21/io-thread-pin
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		4.7.0

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	query	Optional. The system tags.		4.7.0
userTags	List	query	Optional. The user tags.		4.7.0

API Response

Sample Response

```
{
  "volumeUuid": "a8ba696310303ccebb08e128759ecbf8",
  "pin": "3-6",
  "ioThreadId": "1"
}
```

Name	Type	Description	Starting Version
success	boolean		4.7.0
volumeUuid	String	The volume UUID.	4.7.0
ioThreadId	String	The IO thread id.	4.7.0
pin	String	The CPU pinning range.	4.7.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.7.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.7.0
description	String	The brief description of the error.	4.7.0

Name	Type	Description	Starting Version
details	String	The details about the error.	4.7.0
elaboration	String	The reserved field. Default value: null.	4.7.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.7.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.7.0

SDK Sample

Java SDK

```
GetVolumeIoThreadPinAction action = new GetVolumeIoThreadPinAction();
action.uuid = "93150452524b3b548cc597c8405fda21";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetVolumeIoThreadPinAction.Result res = action.call();
```

Python SDK

```
GetVolumeIoThreadPinAction action = GetVolumeIoThreadPinAction()
action.uuid = "93150452524b3b548cc597c8405fda21"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetVolumeIoThreadPinAction.Result res = action.call()
```

5.1.2.20 SetVolumeloThreadPin

API Request

URLs

```
PUT zstack/v1/volumes/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "setVolumeIoThreadPin": {
    "vmUuid": "f225b0e5d5ea3c7bbc3a99fd8fc8315e",
```

```

    "pin": "3-6",
    "ioThreadId": 1
  },
  "systemTags": [],
  "userTags": []
}

```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"setVolumeIoThreadIdPin":

SDK Sample

Java SDK

```
GetDataVolumeAttachableVmAction action = new GetDataVolumeAttachableVmAction();
action.volumeUuid = "df8f99ea16c54b7f945cbf3bc3968708";
action.sessionId = "a6bd56927c384d639f6ed058226a6a87";
GetDataVolumeAttachableVmAction.Result res = action.call();
```

Python SDK

```
GetDataVolumeAttachableVmAction action = GetDataVolumeAttachableVmAction()
action.volumeUuid = "212352bd2dc64bb6b42d052ba7b55c8f"
action.sessionId = "bc975e8c54764903857ddf7e22a8fa88"
GetDataVolumeAttachableVmAction.Result res = action.call()
```

5.1.2.22 AttachDataVolumeToVm

API Request

URLs

```
POST zstack/v1/volumes/{volumeUuid}/vm-instances/{vmInstanceUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{}}' http://localhost:8080/zstack/
v1/volumes/6fdcff5868fe376a98359eba8b3d0efe/vm-instances/
f6abc3b26ffe337ba61dd7298fb0b9df
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vmInstanceUuid	String	url	The VM instance UUID.		0.6
volumeUuid	String	url	The volume UUID.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

SDK Sample

Java SDK

```
DetachDataVolumeFromVmAction action = new DetachDataVolumeFromVmAction();
action.uuid = "a25328c5d8664e9bbfb4056561ff273b";
action.vmUuid = "a50e728336b8455e9802785ee6d81959";
action.sessionId = "b7ff5722af3e42f5ab4d0c77b8664f6c";
DetachDataVolumeFromVmAction.Result res = action.call();
```

Python SDK

```
DetachDataVolumeFromVmAction action = DetachDataVolumeFromVmAction()
action.uuid = "b23d5a96ba19477daca2429f9f181ef"
action.vmUuid = "58ab89b6a8e64a649fc38831ceaa95c8"
action.sessionId = "e97c2484efd84e0ba9f2f50a01a41d1a"
DetachDataVolumeFromVmAction.Result res = action.call()
```

5.1.2.24 AttachDataVolumeToHost

API Request

URLs

```
POST zstack/v1/volumes/{volumeUuid}/hosts/{hostUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "mountPath": "/test/mount/path"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X POST -d '{"params":{"mountPath":"/test/mount/path"}}' http://localhost:8080/zstack/v1/volumes/95bd25d20dff3591a83f45280d05a67d/hosts/c7310b853b1d3e97b09e52c32bd2e9c6
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
volumeUuid	String	url	The volume UUID.		4.5.0
hostUuid	String	url	The host UUID.		4.5.0
mountPath	String	body	The mount path on the host.		4.5.0
systemTags	List	body	Optional. The system tags.		4.5.0
userTags	List	body	Optional. The user tags.		4.5.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
AttachDataVolumeToHostAction action = new AttachDataVolumeToHostAction();
action.volumeUuid = "95bd25d20dff3591a83f45280d05a67d";
action.hostUuid = "c7310b853b1d3e97b09e52c32bd2e9c6";
action.mountPath = "/test/mount/path";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
AttachDataVolumeToHostAction.Result res = action.call();
```

Python SDK

```
AttachDataVolumeToHostAction action = AttachDataVolumeToHostAction()
```

```

action.volumeUuid = "95bd25d20dff3591a83f45280d05a67d"
action.hostUuid = "c7310b853b1d3e97b09e52c32bd2e9c6"
action.mountPath = "/test/mount/path"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
AttachDataVolumeToHostAction.Result res = action.call()

```

5.1.2.25 DetachDataVolumeFromHost

API Request

URLs

```
DELETE zstack/v1/volumes/{volumeUuid}/hosts
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/
volumes/961e87cd9adc335eb4227d98cb835e3c/hosts

```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
volumeUuid	String	url	The volume UUID.		4.5.0
hostUuid	String	body	Optional. The host UUID.		4.5.0
systemTags	List	body	Optional. The system tags.		4.5.0
userTags	List	body	Optional. The user tags.		4.5.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```

{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}

```

```
}
}
```

SDK Sample

Java SDK

```
DetachDataVolumeFromHostAction action = new DetachDataVolumeFromHostAction();
action.volumeUuid = "961e87cd9adc335eb4227d98cb835e3c";
action.hostUuid = "aab7fb71a8eb3082b11f0fe1eb6fd181";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DetachDataVolumeFromHostAction.Result res = action.call();
```

Python SDK

```
DetachDataVolumeFromHostAction action = DetachDataVolumeFromHostAction()
action.volumeUuid = "961e87cd9adc335eb4227d98cb835e3c"
action.hostUuid = "aab7fb71a8eb3082b11f0fe1eb6fd181"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DetachDataVolumeFromHostAction.Result res = action.call()
```

5.1.2.26 CreateVolumeSnapshot

API Request

URLs

```
POST zstack/v1/volumes/{volumeUuid}/volume-snapshots
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "snapshot-volume",
    "description": "a snapshot for volume"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"name":"snapshot-volume","description":"a
snapshot for volume"}}' \
http://localhost:8080/zstack/v1/
volumes/96971a1cd12f3ebdba54578846992057/volume-snapshots
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
volumeUuid	String	url	The volume UUID.		0.6
name	String	body (contained in the params structure)	The snapshot name.		0.6
description	String	body (contained in the params structure)	Optional. The detailed description of the snapshot.		0.6
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

SDK Sample

Java SDK

```
CreateVolumeSnapshotAction action = new CreateVolumeSnapshotAction();
action.volumeUuid = "093310638cef494088eac315cf1ff1b1";
action.name = "snapshot-volume";
action.description = "a snapshot for volume";
action.sessionId = "6020beb6826b4bb5a980965b435b2998";
CreateVolumeSnapshotAction.Result res = action.call();
```

Python SDK

```
CreateVolumeSnapshotAction action = CreateVolumeSnapshotAction()
action.volumeUuid = "5321658e475a4a8d9e41eef1186a079b"
action.name = "snapshot-volume"
action.description = "a snapshot for volume"
action.sessionId = "aad13372afb149918537613c50c3f49b"
CreateVolumeSnapshotAction.Result res = action.call()
```

5.1.2.27 QueryVolumeSnapshot

API Request

URLs

```
GET zstack/v1/volume-snapshots
GET zstack/v1/volume-snapshots/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 7f983595cc744a14bb0fc9bfdd712e39" \
-X GET http://localhost:8080/zstack/v1/volume-snapshots?
q=uuid=a3da945723d44971afded91bf3ebfd4d
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 90e4d7e2760e4f1893b78be27095bb9e" \
```

```
-X GET http://localhost:8080/zstack/v1/volume-snapshots/
d8713ee3864442de8afc6cd614f51921
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryVolumeSnapshot`, and pressing the **Tab** key.

API Response

Sample Response

```

SDK Sample

Java SDK

```
QueryVolumeSnapshotAction action = new QueryVolumeSnapshotAction();
action.conditions = asList("uuid=d8722eb3601448dcbbd9f4b5a93ceb0e");
action.sessionId = "007c535099cc4f2eaab878d021a9d89a";
QueryVolumeSnapshotAction.Result res = action.call();
```

Python SDK

```
QueryVolumeSnapshotAction action = QueryVolumeSnapshotAction()
action.conditions = ["uuid=b64521c0da3a462da02687c4bee1a646"]
action.sessionId = "ecd0d0d0ccbc4be9a2c42a7d7b05d924"
QueryVolumeSnapshotAction.Result res = action.call()
```

5.1.2.28 QueryVolumeSnapshotTree**API Request**

URLs

```
GET zstack/v1/volume-snapshots/trees
```

```
GET zstack/v1/volume-snapshots/trees/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 6765993e28b6428fa5715c69c93962b2" \
-X GET http://localhost:8080/zstack/v1/volume-snapshots/trees?
q=uuid=5ef4209325014bee8b2609e5f2fa3857
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 31697ae56f274658a261b666089f3891" \
-X GET http://localhost:8080/zstack/v1/volume-snapshots/
trees/60a48ac22a474922bd4e18f4a16cff6d
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryVolumeSnapshotTree`, and pressing the **Tab** key.

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
QueryVolumeSnapshotTreeAction action = new QueryVolumeSnapshotT
reeAction();
action.conditions = asList("uuid=f8b757fa8d354157aa83712be91c391c");
action.sessionId = "5a9d257d977543efb617d3a4619e9e10";
QueryVolumeSnapshotTreeAction.Result res = action.call();
```

Python SDK

```
QueryVolumeSnapshotTreeAction action = QueryVolumeSnapshotTreeAction()
action.conditions = ["uuid=e7a8480f474e42aeabb8e9a5c74b2c3b"]
action.sessionId = "43ac6f171e87458096fda52a497a21b2"
```

```
QueryVolumeSnapshotTreeAction.Result res = action.call()
```

5.1.2.29 UpdateVolumeSnapshot

API Request

URLs

```
PUT zstack/v1/volume-snapshots/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateVolumeSnapshot": {
    "name": "My Snapshot"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateVolumeSnapshot":{"name":"My Snapshot"}}' \
http://localhost:8080/zstack/v1/volume-snapshots/
df56acfb356130869fc80dbf80cf3172/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The snapshot UUID.		0.6
name	String	body (contained in the updateVolu	Optional. The new name of the snapshot.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
		meSnapshot structure)			
description	String	body (contained in the updateVolumeSnapshot structure)	Optional. The detailed description of the snapshot.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "a50e9be4b0eb492aa1cbb767e38ee45e",
    "name": "My Snapshot 2",
    "primaryStorageUuid": "/Cloud_ps/rootVolumes/acct-e77f16d460ea46e18262547b56972273/vol-13c66bb52d0949398e520183b917f813/snapshots/2fa6979af5c6479fa98f37d316f44b5f.qcow2",
    "volumeType": "Root",
    "format": "qcow2",
    "latest": false,
    "size": 1310720.0,
    "state": "Enabled",
    "status": "Ready"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6

backupStorageUuid	String	The backup storage UUID.	0.6
installPath	String		0.6

SDK Sample

Java SDK

```
UpdateVolumeSnapshotAction action = new UpdateVolumeSnapshotAction();
action.uuid = "b4eadb8d20cc41e8a575c82553ec912c";
action.name = "My Snapshot";
action.sessionId = "94fb0621bb4647bb989864c845c6c22e";
UpdateVolumeSnapshotAction.Result res = action.call();
```

Python SDK

```
UpdateVolumeSnapshotAction action = UpdateVolumeSnapshotAction()
action.uuid = "e6ded156a6f440889b258d0738c517b4"
action.name = "My Snapshot"
action.sessionId = "36d4adc78a9d4c73b141095efa8c78bc"
```

```
UpdateVolumeSnapshotAction.Result res = action.call()
```

5.1.2.30 DeleteVolumeSnapshot

API Request

URLs

```
DELETE zstack/v1/volume-snapshots/{uuid}?deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 3c050c50069f4dd48ac242bfecd8e510" \
-X DELETE http://localhost:8080/zstack/v1/volume-
snapshots/8aed13fa10114a50b227b2adf17ddba1?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
deleteMode	String	body	Optional. The delete mode . Options: Permissive Enforcing. Default mode: Permissive.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
```

```
"code": "SYS.1001",
"description": "A message or a operation timeout",
"details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteVolumeSnapshotAction action = new DeleteVolumeSnapshotAction();
action.uuid = "ce68d5c274274e4e8d9ce817ef88125b";
action.deleteMode = "Permissive";
action.sessionId = "8118879be81944ceb1342b9fbc8d1eda";
DeleteVolumeSnapshotAction.Result res = action.call();
```

Python SDK

```
DeleteVolumeSnapshotAction action = DeleteVolumeSnapshotAction()
action.uuid = "0665f04d54a54ab78b41f261b04a99fb"
action.deleteMode = "Permissive"
action.sessionId = "4764b21ec49848bfba76b2da27a0fe91"
DeleteVolumeSnapshotAction.Result res = action.call()
```

5.1.2.31 RevertVolumeFromSnapshot

API Request

URLs

```
PUT zstack/v1/volume-snapshots/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "revertVolumeFromSnapshot": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X PUT -d '{"revertVolumeFromSnapshot":{}}' \
http://localhost:8080/zstack/v1/volume-snapshots/
eba17ed729a03a76afb168cf41373daf/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The snapshot UUID.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
RevertVolumeFromSnapshotAction action = new RevertVolumeFromSnapshotAction();
action.uuid = "34a3c300041249d098187c2120ab0097";
action.sessionId = "a5e0822600934b84ba8bb8fa0af5bce0";
RevertVolumeFromSnapshotAction.Result res = action.call();
```

Python SDK

```
RevertVolumeFromSnapshotAction action = RevertVolumeFromSnapshotAction()
action.uuid = "f3728a6d5e324c41a98b12c067db105b"
action.sessionId = "63799306e40e486c94d31dc2fcbbee6a"
```

```
RevertVolumeFromSnapshotAction.Result res = action.call()
```

5.1.2.32 GetVolumeSnapshotSize

API Request

URLs

```
PUT zstack/v1/volume-snapshots/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "getVolumeSnapshotSize": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"getVolumeSnapshotSize":{}}' http://localhost:8080/zstack/
v1/volume-snapshots/3bd9e0b3e39a3abe8d39ccbe9031c723/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The snapshot UUID.		3.5.0
systemTags	List	body	Optional. The system tags.		3.5.0
userTags	List	body	Optional. The user tags.		3.5.0

API Response

Sample Response

```
{
  "size": 1.073741824E11,
  "actualSize": 5.36870912E10
}
```

Name	Type	Description	Starting Version
size	Long	The snapshot size.	3.5.0
actualSize	Long	The actual size of the snapshot.	3.5.0
success	boolean		3.5.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.5.0
error	ErrorCode	See error .	3.5.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.5.0
description	String	The brief description of the error.	3.5.0
details	String	The details about the error.	3.5.0
elaboration	String	The reserved field. Default value: null.	3.5.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.5.0
cause	ErrorCode	The root error, which is the associated root	3.5.0

Name	Type	Description	Starting Version
		cause of the current error. If no root error exists, this parameter is null.	

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	3.5.0
description	String	The brief description of the error.	3.5.0
details	String	The details about the error.	3.5.0
elaboration	String	The reserved field. Default value: null.	3.5.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.5.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.5.0

SDK Sample

Java SDK

```
GetVolumeSnapshotSizeAction action = new GetVolumeSnapshotSizeAction
();
action.uuid = "3bd9e0b3e39a3abe8d39ccbe9031c723";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetVolumeSnapshotSizeAction.Result res = action.call();
```

Python SDK

```
GetVolumeSnapshotSizeAction action = GetVolumeSnapshotSizeAction()
```

```
action.uuid = "3bd9e0b3e39a3abe8d39ccbe9031c723"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetVolumeSnapshotSizeAction.Result res = action.call()
```

5.1.2.33 ShrinkVolumeSnapshot

API Request

URLs

```
PUT zstack/v1/volume-snapshots/shrink/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "shrinkVolumeSnapshot": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"shrinkVolumeSnapshot":{}}' http://localhost:8080/zstack/
v1/volume-snapshots/shrink/1ab2f9f306dd3ab4adba78491be0911/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.10.0
systemTags	List	body	Optional. The system tags.		3.10.0
userTags	List	body	Optional. The user tags.		3.10.0

API Response

Sample Response

```
{
  "shrinkResult": {
    "oldSize": 2.147483648E9,
    "size": 1.073741824E9,
    "deltaSize": 1.073741824E9
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.10.0
shrinkResult	ShrinkResult	See shrinkResult .	3.10.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.10.0
description	String	The brief description of the error.	3.10.0
details	String	The details about the error.	3.10.0
elaboration	String	The reserved field. Default value: null.	3.10.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.10.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error	3.10.0

Name	Type	Description	Starting Version
		exists, this parameter is null.	

#shrinkResult

Name	Type	Description	Starting Version
oldSize	long		3.10.0
size	long		3.10.0
deltaSize	long		3.10.0

SDK Sample

Java SDK

```
ShrinkVolumeSnapshotAction action = new ShrinkVolumeSnapshotAction();
action.uuid = "1ab2f9f306dd3ab4adbaf78491be0911";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
ShrinkVolumeSnapshotAction.Result res = action.call();
```

```
ShrinkVolumeSnapshotAction action = ShrinkVolumeSnapshotAction()
action.uuid = "1ab2f9f306dd3ab4adbaf78491be0911"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
ShrinkVolumeSnapshotAction.Result res = action.call()
```

5.1.2.34 FlattenVolume

API Request

URLs

```
PUT zstack/v1/volumes/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "flattenVolume": {
    "dryRun": false
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"flattenVolume":{"dryRun":false}}' http://
localhost:8080/zstack/v1/volumes/df7876b9124d3fcb92528cf774fa6de1/
actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.10.0
dryRun	boolean	body (contained in the flattenVolume structure)	Optional. Trial . Predicate the data usage.		4.7.0
systemTags	List	body	Optional. The system tags.		3.10.0
userTags	List	body	Optional. The user tags.		3.10.0

```

```
AddImageAction.Result res = action.call()
```

5.1.3.2 DeleteImage

API Request

URLs

```
DELETE zstack/v1/images/{uuid}?
backupStorageUuids={backupStorageUuids}&deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "backupStorageUuids": [
      "2499cd48fc33450a8737efff67ccb920"
    ],
    "deleteMode": "Permissive"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth fb8be86094544022ad3e3abd0027b420" \
-X DELETE http://localhost:8080/zstack/v1/images/
f92e888c970c4f739d91e59f6dd94b1e?
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The image UUID.		0.6
backupStorageUuids	List	body	Optional. The backup		0.6

Name	Type	Location	Description	Optional Value	Starting Version
			storage UUID list.		
deleteMode	String	body	Optional. The delete mode . Options: Permissive Enforcing. Default mode: Permissive.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteImageAction action = new DeleteImageAction();
action.uuid = "22850dff70934ffdaa839a950cb5a470";
action.backupStorageUuids = asList("32974c8955cd4ed79d13458e41490883");
action.deleteMode = "Permissive";
action.sessionId = "517a458b87ca49cf80bf26e6000bc611";
DeleteImageAction.Result res = action.call();
```

Python SDK

```
DeleteImageAction action = DeleteImageAction()
action.uuid = "5bbd892e048b48b283e5d2f49a6a4e94"
action.backupStorageUuids = [fd127191bf504e3daf5292800c1ea2d8]
action.deleteMode = "Permissive"
action.sessionId = "cf5cf2689379496aaa4449fd14dc8330"
```

```
DeleteImageAction.Result res = action.call()
```

5.1.3.3 ExpungeImage

API Request

URLs

```
PUT zstack/v1/images/{imageUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "expungeImage": {
    "backupStorageUuids": [
      "ef3843bdde80427e9c8c0d4f05aa5cde"
    ]
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"expungeImage":{"backupStorageUuids":
["3be136c8d8b8323bb94b8464aae4b0a7"]}}' \
http://localhost:8080/zstack/v1/
images/4dcddfadcd113b5f89f181c4f4a080c7/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
Uuid	String	body (contained in the params structure)	The resource UUID.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
imageUuid	String	url	The image UUID.		0.6
backupStorageUuids	List	body (contained in the params structure)	Optional. The backup storage UUID list.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
ExpungeImageAction action = new ExpungeImageAction();
action.imageUuid = "ddb63556ae714ee78bf468d5067beedd";
action.backupStorageUuids = asList("6f21a1307fb24117a25ed907c00a3e47");
action.sessionId = "b12c879167d3459a844b6ac1f8ff3b74";
ExpungeImageAction.Result res = action.call();
```

Python SDK

```
ExpungeImageAction action = ExpungeImageAction()
action.imageUuid = "59fcc3775336469facfd93c5c16bdb2d"

```

Name	Type	Description	Starting Version
success	Boolean		5.0.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventory	ImageInventory	See inventory .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
name	String	The resource name.	0.6
description	String	The detailed description of the resource.	0.6
state	String	The state of the image.	0.6
status	String	The status of the image.	0.6
size	Long	The image size.	0.6
actualSize	Long	The actual size of the image.	0.6
md5Sum	String	The MD5 checksum of the image.	0.6
url	String	The URL of the image.	0.6
mediaType	String	The image type.	0.6
guestOsType	String	The guest operating system type of the image.	0.6
type	String	The reserved field.	0.6
architecture	String	The image architecture.	5.0.0
platform	String	The system platform of the image.	0.6
format	String	The image format, for example, raw.	0.6
system	Boolean	Whether the image is a system image.	0.6
virtio	Boolean	Whether virtio is supported or not.	5.0.0
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6

Name	Type	Description	Starting Version
backupStorageRefs	List	See backupStorageRefs .	0.6

#backupStorageRefs

Name	Type	Description	Starting Version
imageUuid	String	The image UUID.	0.6
backupStorageUuid	String	The backup storage UUID.	0.6
installPath	String	The installation path on the backup storage.	0.6
exportUrl	String	The URL for exporting the image.	0.6
exportMd5Sum	String	The MD5 checksum of the image.	0.6
status	String	The status of the image.	0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6

SDK Sample

Java SDK

```
RecoverImageAction action = new RecoverImageAction();
action.imageUuid = "3220b5ea2ae24883a4eb847634e3e349";
action.backupStorageUuids = asList("ad4dcd853b894362bfd18c06779ed758");
action.sessionId = "66ba41da8526424d9ab70ed0072b8d22";
RecoverImageAction.Result res = action.call();
```

Python SDK

```
RecoverImageAction action = RecoverImageAction()
action.imageUuid = "7f8bb365b8d3413ab5d09f6d381552c3"
action.backupStorageUuids = ["14d99a1ade5a431ea254902c808d7319"]
action.sessionId = "044d56deddd849a092ff02ae54386cf1"
```

```
RecoverImageAction.Result res = action.call()
```

5.1.3.6 ChangedImageState

API Request

URLs

```
PUT zstack/v1/images/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeImageState": {
    "stateEvent": "disable"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"changeImageState":{"stateEvent":"disable"}}' \
http://localhost:8080/zstack/v1/
images/5a4e7e1f1a653505925da09d0a64936b/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The image UUID.		0.6
stateEvent	String	body (contained in the params structure)	The state of the image.	- enable - disable	0.6

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{

```

5.1.3.7 UpdateImage

API Request

URLs

```
PUT zstack/v1/images/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateImage": {
    "platform": "Windows",
    "virtio": false
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X PUT -d '{"updateImage":{"platform":"Windows","virtio":false}}'
http://localhost:8080/zstack/v1/
images/38549d5d5a3d3c5caefc18d8a9e0aa13/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The image UUID.		0.6
name	String	body (contained in the updateImage structure)	Optional. The image name.		0.6
description	String	body (contained in the updateImage structure)	Optional. The detailed description of the image.		0.6
guestOsType	String	body (contained in the updateImage structure)	Optional. The operating system type of the guest VM instance that corresponds to the image.		0.6
mediaType	String	body (contained in the updateImage structure)	Optional. The image type.	- RootVolume Template - DataVolume Template - ISO	0.6
architecture	String	body (contained in the updateImage structure)	Optional.	- x86_64 - aarch64 - mips64el - loongarch64	4.0.0
format	String	body (contained in the	Optional. The image format.	- raw - qcow2	0.6

Name	Type	Location	Description	Optional Value	Starting Version
		updateImage structure)		iso	
system	Boolean	body (contained in the updateImage structure)	Optional. Specifies whether the image is a system image.		0.6
platform	String	body (contained in the updateImage structure)	Optional. The system platform of the image.	- Linux - Windows - WindowsVir tio - Other - Paravirtua lization	0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6
virtio	Boolean	body (contained in the updateImage structure)			5.0.0

status	String		0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6

SDK Sample

Java SDK

```
SyncImageSizeAction action = new SyncImageSizeAction();
action.uuid = "46638764dfcb47b2bf916bce60d50f9f";
action.sessionId = "557e2989aa7d4178861c4fcacb85e40c";
```

```
SyncImageSizeAction.Result res = action.call();
```

Python SDK

```
SyncImageSizeAction action = SyncImageSizeAction()
action.uuid = "0073e30d1fd84cd0b47896e5bb22b205"
action.sessionId = "e6896c8311824d718e330908ec04d9a6"
SyncImageSizeAction.Result res = action.call()
```

5.1.3.9 DeleteImagePackage

API Request

URLs

```
DELETE zstack/v1/image-packages/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/image-packages/
e7660c815f483befb15905bf6c776781?
```

Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		4.4.6
deleteMode	String	body	Optional. The deletion mode.	• Permissive • Enforcing	4.4.6
systemTags	List	body	Optional. The system tags.		4.4.6
userTags	List	body	Optional. The user tags.		4.4.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteImagePackageAction action = new DeleteImagePackageAction();
action.uuid = "e7660c815f483befb15905bf6c776781";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteImagePackageAction.Result res = action.call();
```

Python SDK

```
DeleteImagePackageAction action = DeleteImagePackageAction()
action.uuid = "e7660c815f483befb15905bf6c776781"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteImagePackageAction.Result res = action.call()
```

5.1.3.10 QueryImagePackage

API Request

URLs

```
GET zstack/v1/image-packages
```

```
GET zstack/v1/image-packages/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/image-packages?
q=uuid=7cd2f1b456ce3045b78d3c1eb58cc03d
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
```

```
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/image-
packages/1c57c91becf431f3b098800fc900c708
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryImage`, and pressing the **Tab** key.

error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.4.6
inventories	List	See inventories .	4.4.6

#error

Name	Type	Location	Description
code	String	The error code, which is a numbered or alphanumeric code that specifies an error	4.4.6

Name	Type	Location	Description
		. For example, SYS.1000, HOST.1001.	
description	String	The brief description of the error.	4.4.6
details	String	The details about the error.	4.4.6
elaboration	String	The reserved field. Default value: null.	4.4.6
opaque	LinkedHashMap	The reserved field. Default value: null.	4.4.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.4.6

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	4.4.6
name	String	The resource name.	4.4.6
description	String	The resource description.	4.4.6
vmUuid	String	The source VM UUID.	4.4.6
backupStorageUuid	String	The backup storage UUID.	4.4.6
exportUrl	String	The download address .	4.4.6
md5Sum	String	The MD5 sum of the image package.	4.4.6
format	String	The image package format.	4.4.6
size	Long	The image package size.	4.4.6

Name	Type	Description	Starting Version
createDate	Timestamp	The creation time.	4.4.6
lastOpDate	Timestamp	The last operation time	4.4.6
state	ImagePackageState	See state .	4.4.6

#state

Name	Type	Description	Starting Version
Exporting	ImagePackageState	The image package is exporting.	4.4.6
Exported	ImagePackageState	The image package is exported.	4.4.6

SDK Sample

Java SDK

```
QueryImagePackageAction action = new QueryImagePackageAction();
action.conditions = asList("uuid=5319396fe8f0393d998ac6c0939e780e");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryImagePackageAction.Result res = action.call();
```

Python SDK

```
QueryImagePackageAction action = QueryImagePackageAction()
action.conditions = ["uuid=99435bfd7903372289db27c8a2b1038c"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryImagePackageAction.Result res = action.call()
```

5.1.3.11 UpdateImagePackage**API Request**

URLs

```
PUT zstack/v1/image-packages/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateImagePackage": {
    "name": "ova-update",
```

```

    "description": "description-update"
  },
  "systemTags": [],
  "userTags": []
}

```

**Note:**

In the preceding sample, the **userTags** field is optional. This field can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/image-packages/
eeed157556d2328c9c3aeeec71ab75463

```

Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		4.4.6
name	String	body(contained in the updateImagePackage structure)	Optional. The resource name.		4.4.6
description	String	body(contained in the updateImagePackage structure)	Optional. The resource description.		4.4.6
systemTags	List	body	Optional. The system tags.		4.4.6
userTags	List	body	Optional. The user tags.		4.4.6

API Response**Sample Response**

```

{
  "inventory": {
    "uuid": "ecdea1f236a13e74a5712edabb4cfe9e",

```

```

"name": "ova",
"description": "description",

Exported	ImagePackageState	The image package is exported.	4.4.6

SDK Sample

Java SDK

```
QueryImagePackageAction action = new QueryImagePackageAction();
action.conditions = asList("uuid=5319396fe8f0393d998ac6c0939e780e");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryImagePackageAction.Result res = action.call();
```

Python SDK

```
QueryImagePackageAction action = QueryImagePackageAction()
action.conditions = ["uuid=99435bfd7903372289db27c8a2b1038c"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryImagePackageAction.Result res = action.call()
```

5.1.3.12 GetCandidateBackupStorageForCreatingImage

API Request

URLs

```
GET zstack/v1/images/volumes/{volumeUuid}/candidate-backup-storage
GET zstack/v1/images/volume-snapshots/{volumeSnapshotUuid}/candidate-backup-storage
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 146b6ded7a9744068ba57b87ca1bd0c0" \
-X GET http://localhost:8080/zstack/v1/images/
volumes/1e816db3824f489a944f1f6c6beb83cc/candidate-backup-storage?\
volumeUuid=1e816db3824f489a944f1f6c6beb83cc&volumeSnapshotUuid=223f7f53ce544036a9
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth dcd0948b7a90449ba8b09270ad3041d2" \
-X GET http://localhost:8080/zstack/v1/images/volume-
snapshots/98fcb829c80a4b08b700fb3e43c2d8ce/candidate-backup-storage?\
volumeUuid=17d1d7becabf4800937b23d2f505a56d&volumeSnapshotUuid=98fcb829c80a4b08b7
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
volumeUuid	String	query	Optional. The volume UUID. Make		0.6

Name	Type	Location	Description	Optional Value	Starting Version
			sure that at least one of volumeUuid and volumeSnap shotUuid is not null.		
volumeSnap shotUuid	String	query	Optional. The volume snapshot UUID. Make sure that at least one of volumeUuid and volumeSnap shotUuid is not null.		0.6
systemTags	List	query	Optional. The system tags.		0.6
userTags	List	query	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
GetCandidateBackupStorageForCreatingImageAction action = new
GetCandidateBackupStorageForCreatingImageAction();
action.volumeUuid = "77e77779b5f94617af0a8b08b4a50129";
```

```
action.volumeSnapshotUuid = "4a5220b5b1f044f8826520eb506d0f98";
action.sessionId = "45b0a87571c2476ba2fe6623daaa79cf";
GetCandidateBackupStorageForCreatingImageAction.Result res = action.
call();
```

Python SDK

```
GetCandidateBackupStorageForCreatingImageAction action = GetCandida
teBackupStorageForCreatingImageAction()
action.volumeUuid = "83792660358b4e14b266c5d0920b8b21"
action.volumeSnapshotUuid = "3d562e4325cc42ce8bd3115b48f79ae4"
action.sessionId = "2ba3d333ac284a20adc782766f597330"
GetCandidateBackupStorageForCreatingImageAction.Result res = action.
call();
```

5.1.3.13 CreateRootVolumeTemplateFromRootVolume

API Request

URLs

```
POST zstack/v1/images/root-volume-templates/from/volumes/
{rootVolumeUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "My Root Volume Template",
    "backupStorageUuids": [
      "e67b9791a8204b31842c3b36457ce56c"
    ],
    "platform": "Linux",
    "system": false
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"name":"My Root Volume
Template","backupStorageUuids":
```

```
[ "a3cb55d45fb63d1da4911b9d16273a55" ], "platform": "Linux", "system": false } }'
\
http://localhost:8080/zstack/v1/images/root-volume-templates/from/
volumes/3bfc6f9eaf243299b8515382310be47b
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The name of the root volume image.		0.6
description	String	body (contained in the params structure)	Optional. The detailed description of the root volume image.		0.6
guestOsType	String	body (contained in the params structure)	Optional. The operating system type of the guest VM instance that corresponds to the root volume image.		0.6
backupStorageUuids	List	body (contained in the params structure)	Optional. The backup storage UUID list.		0.6
rootVolumeUuid	String	body (contained in the params structure)	The root volume UUID.		0.6
platform	String	body (contained in the params structure)	Optional. The system platform of the root volume image.	- Linux - Windows - WindowsVirtio - Other - Paravirtualization	0.6

Name	Type	Location	Description	Optional Value	Starting Version
system	boolean	body (contained in the params structure)	Optional. Whether the root volume image is a system root volume image.		0.6
resourceUuid	String	body (contained in the params structure)	Optional. The UUID of the root volume image. If specified, the root volume image will use the specified value as UUID.		0.6
architecture	String	body (contained in the params structure)	Optional.	- x86_64 - aarch64 - mips64el	4.0.0
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6
virtio	List	body (contained in the params structure)	Optional.		5.0.0

**Note:**

- When you create an image from a root volume, ZStack Cloud copies the value of the GuestTools tag from VM instance to image. When you use this image to create a VM instance, the value of the GuestTools tag will be copied from the image to the target VM instance. Note that you can add the **GuestTools** option to **SystemTags**.

- Format of the **GuestTools** option: `GuestTools::TOOLS_VERSION`. Here, the initial value of `TOOLS_VERSION` is 1.0.0. This value will change as the version of GuestTools is upgraded.
- Example: `GuestTools::1.0.0`
- Note: When you create an image from the root volume of a VM instance, the value of the GuestTools tag will be copied from the VM instance to the target image.

call()
```

5.1.3.15 CreateDataVolumeTemplateFromVolume

API Request

URLs

```
POST zstack/v1/images/data-volume-templates/from/volumes/{volumeUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "My Data Volume Template",
    "backupStorageUuids": [
      "7fd08286addc4b388fac61935892acd7"
    ]
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"name":"My Data Volume
Template","backupStorageUuids":
["08e337886b873e8685991d1c7ba4d1ab"]}}' \
http://localhost:8080/zstack/v1/images/data-volume-templates/from/
volumes/4c941eb9faeb3976803f3609a475
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The name of the data volume image.		0.6
description	String	body (contained in the params structure)	Optional. The detailed description of the data volume image.		0.6
volumeUuid	String	body (contained in the params structure)	The UUID of the volume from which the data volume image is to be created.		0.6
backupStorageUuids	List	body (contained in the params structure)	Optional. The backup storage UUID list.		0.6
resourceUuid	String	body (contained in the params structure)	Optional. The UUID of the data volume image. If		0.6

Name	Type	Location	Description	Optional Value	Starting Version
			specified, the data volume image will use the specified value as UUID.		
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID.		5.0.0

```

5.1.3.17 GetImageQga

API Request

URLs

```
GET zstack/v1/images/{uuid}/qga
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth e74211f026f741c1898d4377ecf58bd1" \
-X GET http://localhost:8080/zstack/v1/
images/34a5bf0cc1014286bd944771c77e1c07/qga
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	query	Optional. The system tags.		0.6
userTags	List	query	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "enable": false
}
```

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
enable	boolean		0.6
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6

Name	Type	Description	Starting Version
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

SDK Sample

Java SDK

```
GetImageQgaAction action = new GetImageQgaAction();
action.uuid = "0d7b698ccb174702ae5fa7f15bce8612";
action.sessionId = "3e59586b589d4dbeb0afd078bb887655";
GetImageQgaAction.Result res = action.call();
```

Python SDK

```
GetImageQgaAction action = GetImageQgaAction()
action.uuid = "82a89e52f2c54fab9b73f095e23ddecb"
action.sessionId = "fc8ea8bda61143cea7db98957ccd026f"
GetImageQgaAction.Result res = action.call()
```

5.1.3.18 SetImageQga

API Request

URLs

```
PUT zstack/v1/images/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "setImageQga": {
    "enable": true
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"setImageQga":{"enable":true}}' \
http://localhost:8080/zstack/v1/images/
f85a077c64883070ac3ba72079edc804/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
enable	boolean	body (contained in the setImageQga structure)			0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
SetImageQgaAction action = new SetImageQgaAction();
action.uuid = "0eca41aa133a43d2b8d14958cd3b3f26";
action.enable = true;
action.sessionId = "a05d7d13fb514bb5bd16060c7584d6e6";
SetImageQgaAction.Result res = action.call();
```

Python SDK

```
SetImageQgaAction action = SetImageQgaAction()
action.uuid = "f397649bf07049efb0be7836962d03fe"
action.enable = true
action.sessionId = "0bfcd0ef201142bcb00ab5903b178da5"
SetImageQgaAction.Result res = action.call()
```

5.1.3.19 SetImageBootMode

API Request

URLs

```
PUT zstack/v1/images/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "setImageBootMode": {
    "bootMode": "Legacy"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X PUT -d '{"setImageBootMode":{"bootMode":"Legacy"}}' http://localhost:8080/zstack/v1/images/4efcba4c12cc35f4a1b262038f7e7b80/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.9.0
bootMode	String	body(contained in the setImageBootMode structure)	The image boot mode.	- Legacy - UEFI - UEFI_WITH_CSM	3.9.0
systemTags	List	body	Optional. The system tags.		3.9.0
userTags	List	body	Optional. The user tags.		3.9.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
SetImageBootModeAction action = new SetImageBootModeAction();
action.uuid = "4efcba4c12cc35f4a1b262038f7e7b80";
action.bootMode = "Legacy";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
SetImageBootModeAction.Result res = action.call();
```

Python SDK

```
SetImageBootModeAction action = SetImageBootModeAction()
action.uuid = "4efcba4c12cc35f4a1b262038f7e7b80"
action.bootMode = "Legacy"
```

```
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
setImageBootModeAction.Result res = action.call()
```

5.1.3.20 GetUploadImageJobDetails

API Request

URLs

```
PUT zstack/v1/images/upload-job/details/{imageId}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "setImageBootMode": {
    "bootMode": "Legacy"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/images/upload-job/details/
d41d8cd98f00b204e9800998ecf8427e?
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
imageId	String	url	The user-defined image ID. We recommend that you use an MD5 value.		4.1.0

Name	Type	Location	Description	Valid Value	Starting Version
systemTags	List	body	Optional. The system tags.		4.1.0
userTags	List	body	Optional. The user tags.		4.1.0

API Response

Sample Response

```
{
  "existingJobDetails": [
    {
      "longJobUuid": "0792dd52aeb9329cb1e677fae6465f23",

http://localhost:8080/zstack/v1/
images/38549d5d5a3d3c5caefc18d8a9e0aa13/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The image UUID.		5.0.0
backupStorageUuid	String	body (contained in the calculateImageHash)	The backup storage uuid.		5.0.0

Name	Type	Location	Description	Optional Value	Starting Version
		mageHash structure)			
algorithm	String	body (contained in the calculate mageHash structure)	Optional.		5.0.0
systemTags	List	body	Optional. The system tags.		5.0.0
userTags	List	body	Optional. The user tags.		5.0.0

API Response

Sample Response

```

  }
}
```

Name	Type	Description	Starting Version
success	boolean		5.0.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	5.0.0

Name	Type	Description	Starting Version
inventory	ImageInventory	See inventory .	5.0.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	5.0.0
description	String	The brief description of the error.	5.0.0
details	String	The details about the error.	5.0.0
elaboration	String	The reserved field. Default value: null.	5.0.0
opaque	LinkedHashMap	The reserved field. Default value: null.	5.0.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	5.0.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	5.0.0
name	String	The resource name.	5.0.0
description	String	The detailed description of the resource.	5.0.0
state	String	The state of the image.	5.0.0
status	String	The status of the image.	5.0.0

Name	Type	Description	Starting Version
size	Long	The image size.	5.0.0
actualSize	Long	The actual size of the image.	5.0.0
md5Sum	String	The MD5 checksum of the image.	5.0.0
url	String	The URL of the image.	5.0.0
mediaType	String	The image type.	5.0.0
guestOsType	String	The guest operating system type of the image.	5.0.0
type	String	The reserved field.	5.0.0
platform	String	The system platform of the image.	5.0.0
architecture	String	The image architecture.	5.0.0
format	String	The image format, for example, raw.	5.0.0
virtio	Boolean	Whether the image is a system image.	5.0.0
system	Boolean	Whether virtio is supported or not.	5.0.0
createDate	Timestamp	The creation date.	5.0.0
lastOpDate	Timestamp	The last operation date.	5.0.0
backupStorageRefs	List	See backupStorageRefs .	5.0.0

#backupStorageRefs

Name	Type	Description	Starting Version
imageUuid	String	The image UUID.	5.0.0
backupStorageUuid	String	The backup storage UUID.	5.0.0

Name	Type	Description	Starting Version
installPath	String	The installation path on the backup storage.	5.0.0
exportUrl	String	Exporting the url of the image.	5.0.0
exportMd5Sum	String	Exporting the MD5 value of the image.	5.0.0
status	String	The image ready status.	5.0.0
createDate	Timestamp	The creation date.	5.0.0
lastOpDate	Timestamp	The last operation date.	5.0.0

SDK Sample

Java SDK

```
CalculateImageHashAction action = new CalculateImageHashAction();
action.uuid = "383bcf0b1515369a8169b66a91de1e00";
action.backupStorageUuid = "0eeaa5988c743c638485304f3d1f867e";
action.algorithm = "MD5";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CalculateImageHashAction.Result res = action.call();
```

Python SDK

```
CalculateImageHashAction action = CalculateImageHashAction()
action.uuid = "383bcf0b1515369a8169b66a91de1e00"
action.backupStorageUuid = "0eeaa5988c743c638485304f3d1f867e"
action.algorithm = "MD5"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
CalculateImageHashAction.Result res = action.call()
```

5.1.4 Affinity Group Operations

5.1.4.1 CreateAffinityGroup

API Request

URLs

```
POST zstack/v1/affinity-groups
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "vm-affinity-group",
    "description": "vm affinity group for test vms",
    "policy": "antiSoft",
    "type": "host"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"name":"vm-affinity-group","description":"vm
affinity group for test vms","policy":"antiSoft","type":"host"}}' \
http://localhost:8080/zstack/v1/affinity-groups
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The affinity group name.		2.3

Name	Type	Location	Description	Optional Value	Starting Version
description	String	body (contained in the params structure)	Optional. The detailed description of the affinity group.		2.3
policy	String	body (contained in the params structure)	The affinity group policy.	• antiSoft	2.3
type	String	body (contained in the params structure)	Optional. The affinity group type. • The current type is host. • In the future, network, router, data center, and rack affinity groups will be supported.	• host	2.3
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		2.3
systemTags	List	body	Optional. The system tags.		2.3
userTags	List	body	Optional. The user tags.		2.3

API Response

Sample Response

```
{
```

```

"inventory": {
  "uuid": "05ad02be7c5f4a6a9b6d164cb2980be6",
  "name": "affinity-group-test",
  "description": "affinity group for test",
  "policy": "ANTISOFT",
  "version": "1.0",
  "type": "HOST"
}
}

```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.3
inventory	AffinityGroupInventory	See inventory .	2.3

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	2.3
description	String	The brief description of the error.	2.3
details	String	The details about the error.	2.3
elaboration	String	The reserved field. Default value: null.	2.3
opaque	LinkedHashMap	The reserved field. Default value: null.	2.3
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	2.3

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	2.3
name	String	The resource name.	2.3
description	String	The detailed description of the resource.	2.3
policy	String	The affinity group policy.	2.3
version	String	The version of the affinity group allocation algorithm.	2.3
type	String	The affinity group type. - The current type is host. - In the future, network, router, data center, and rack affinity groups will be supported.	2.3
appliance	String	The affinity group appliance.	2.3
state	String		2.3
createDate	Timestamp	The creation date.	2.3
lastOpDate	Timestamp	The last operation date.	2.3
usages	List	See usages .	2.3

#usages

Name	Type	Description	Starting Version
uuid	String	The resource binding UUID of the affinity group.	2.3
affinityGroupUuid	String	The affinity group UUID.	2.3

Name	Type	Description	Starting Version
resourceUuid	String	The UUID of the resource that joins the affinity group.	2.3
resourceType	String	The type of the resource that joins the affinity group.	2.3
createDate	Timestamp	The creation date.	2.3
lastOpDate	Timestamp	The last operation date.	2.3

SDK Sample

Java SDK

```
CreateAffinityGroupAction action = new CreateAffinityGroupAction();
action.name = "vm-affinity-group";
action.description = "vm affinity group for test vms";
action.policy = "antiSoft";
action.type = "host";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateAffinityGroupAction.Result res = action.call();
```

Python SDK

```
CreateAffinityGroupAction action = CreateAffinityGroupAction()
action.name = "vm-affinity-group"
action.description = "vm affinity group for test vms"
action.policy = "antiSoft"
action.type = "host"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CreateAffinityGroupAction.Result res = action.call()
```

5.1.4.2 DeleteAffinityGroup

API Request

URLs

```
DELETE zstack/v1/affinity-groups/{uuid}?deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X DELETE http://localhost:8080/zstack/v1/affinity-groups/
ed0b2f029cc53ca385adc19dd36b51be?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.2
deleteMode	String	url	Optional. The delete mode.		2.2
systemTags	List	body	Optional. The system tags.		2.2
userTags	List	body	Optional. The user tags.		2.2

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteAffinityGroupAction action = new DeleteAffinityGroupAction();
action.uuid = "ed0b2f029cc53ca385adc19dd36b51be";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteAffinityGroupAction.Result res = action.call();
```

Python SDK

```
DeleteAffinityGroupAction action = DeleteAffinityGroupAction()
action.uuid = "ed0b2f029cc53ca385adc19dd36b51be"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
DeleteAffinityGroupAction.Result res = action.call()
```

5.1.4.3 QueryAffinityGroup

API Request

URLs

```
GET zstack/v1/affinity-groups
GET zstack/v1/affinity-groups/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/affinity-groups?
q=uuid=656ebc992c3333fea209c6c90e6a76cf
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/affinity-groups/
b49759dff8593098a1d106c8129974cf
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryAffinityGroup`, and pressing the **Tab** key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "uuid": "99fa95af4aac4eaabd320dbdd6d36ef8",
      "name": "affinity-group-test",
      "description": "affinity group for test",
      "policy": "ANTISOFT",
      "version": "1.0",
      "type": "HOST",
      "usages": [
        {
          "resourceUuid": "acedd8848c874cd7b1c68df7c593f6c1",
          "resourceType": "HOST"
        }
      ]
    }
  ]
}
```

}

SDK Sample

Java SDK

```
QueryAffinityGroupAction action = new QueryAffinityGroupAction();
action.conditions = asList("uuid=bceb37906e673f37bb425933bdf2df46");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryAffinityGroupAction.Result res = action.call();
```

Python SDK

```
QueryAffinityGroupAction action = QueryAffinityGroupAction()
action.conditions = ["uuid=3714ccec7a933aba94c073fcb46e52bd"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryAffinityGroupAction.Result res = action.call()
```

5.1.4.4 UpdateAffinityGroup

API Request

URLs

```
PUT zstack/v1/affinity-groups/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateAffinityGroup": {
    "name": "new name",
    "description": "desc"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateAffinityGroup":{"name":"new
name","description":"desc"}}' \
http://localhost:8080/zstack/v1/affinity-groups/
f287ad59b76c34b0917fa9f897b63d69/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.3
name	String	body (contained in the updateAffinityGroup structure)	Optional. The resource name.		2.3
description	String	body (contained in the updateAffinityGroup structure)	Optional. The detailed description of the resource.		2.3
systemTags	List	body	Optional. The system tags.		2.3
userTags	List	body	Optional. The user tags.		2.3

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "f8c3b350df9a3bfd960359f302a4fba2",
    "name": "affinity group",
    "description": "affinity group for test",
    "policy": "ANTISOFT",
    "type": "HOST"
```

```
}
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.3
inventory	AffinityGroupInventory	See inventory .	2.3

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	2.3
description	String	The brief description of the error.	2.3
details	String	The details about the error.	2.3

AddVmToAffinityGroupAction.Result res = action.call()
```

5.1.4.6 RemoveVmFromAffinityGroup

API Request

URLs

```
DELETE zstack/v1/affinity-groups/{affinityGroupUuid}/vm-instances?
uuid={uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/affinity-
groups/6d1e8b61e30e38ceb8300ed722c6a85a/vm-instances?
uuid=2736c4e5c4f3301e8a9ee7cc64847033
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
affinityGroupUuid	String	url	The affinity group UUID.		2.3
uuid	String	url	The resource UUID.		2.3
systemTags	List	body	Optional. The system tags.		2.3
userTags	List	body	Optional. The user tags.		2.3

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "15b102d8d08947e6b38fc619c71a5cfe",
    "name": "affinity-group-test",
    "description": "affinity group for test",
    "policy": "ANTISOFT",
    "version": "1.0",
    "type": "HOST"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.3
inventory	AffinityGroupInventory	See inventory .	2.3

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	2.3

Name	Type	Description	Starting Version
description	String	The brief description of the error.	2.3
details	String	The details about the error.	2.3
elaboration	String	The reserved field. Default value: null.	2.3
opaque	LinkedHashMap	The reserved field. Default value: null.	2.3
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	2.3

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	2.3
name	String	The resource name.	2.3
description	String	The detailed description of the resource.	2.3
policy	String	The affinity group policy.	2.3
version	String	The version of the affinity group allocation algorithm.	2.3
type	String	The affinity group type. - The current type is host. - In the future, network, router, data center, and rack affinity groups will be supported.	2.3

Name	Type	Description	Starting Version
appliance	String	The affinity group appliance.	2.3
state	String		2.3
createDate	Timestamp	The creation date.	2.3
lastOpDate	Timestamp	The last operation date.	2.3
usages	List	See usages .	2.3

#usages

Name	Type	Description	Starting Version
uuid	String	The resource binding UUID of the affinity group.	2.3
affinityGroupUuid	String	The affinity group UUID.	2.3
resourceUuid	String	The UUID of the resource that joins the affinity group.	2.3
resourceType	String	The type of the resource that joins the affinity group.	2.3
createDate	Timestamp	The creation date.	2.3
lastOpDate	Timestamp	The last operation date.	2.3

SDK Sample

Java SDK

```
RemoveVmFromAffinityGroupAction action = new RemoveVmFromAffinityGroupAction();
action.affinityGroupUuid = "6d1e8b61e30e38ceb8300ed722c6a85a";
action.uuid = "2736c4e5c4f3301e8a9ee7cc64847033";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
RemoveVmFromAffinityGroupAction.Result res = action.call();
```

Python SDK

```
RemoveVmFromAffinityGroupAction action = RemoveVmFromAffinityGroupAction()
```

```

action.affinityGroupUuid = "6d1e8b61e30e38ceb8300ed722c6a85a"
action.uuid = "2736c4e5c4f3301e8a9ee7cc64847033"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
RemoveVmFromAffinityGroupAction.Result res = action.call()

```

5.1.4.7 ChangeAffinityGroupState

API Request

URLs

```
PUT zstack/v1/affinity-groups/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```

{
  "changeAffinityGroupState": {
    "stateEvent": "enable"
  },
  "systemTags": [],
  "userTags": []
}

```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"changeAffinityGroupState":{"stateEvent":"enable"}}' \
http://localhost:8080/zstack/v1/affinity-groups/
f32fd1a910d439d7ab93cd4660a02837/actions

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.3
stateEvent	String	body (contained in the		- enable - disable	2.3

Name	Type	Location	Description	Optional Value	Starting Version
		changeAffinityGroupState structure)			
systemTags	List	body	Optional. The system tags.		2.3
userTags	List	body	Optional. The user tags.		2.3

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "034e3ef3798f3374b85d414057313a3c",
    "name": "Test-AffinityGroup",

GetCandidateAffinityGroupForCreatingVmAction.Result res = action.call()
```

5.1.5 VM Scheduling Rule Group Operations

5.1.5.1 CreateHostSchedulingRuleGroup

API Request

URLs

```
POST zstack/v1/hostSchedulingRuleGroup
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "test",
    "description": "test desc",
    "zoneUuid": "4e083eaa197835778fa94d9bfcf012d6",
    "clusterUuid": "e7127ff00fbb3ed3a9755c37447b7bf8"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X POST -d '{"params":{"name":"test","description":"test desc","zoneUuid":"4e083eaa197835778fa94d9bfcf012d6","clusterUuid":"e7127ff00fbb3http://localhost:8080/zstack/v1/hostSchedulingRuleGroup
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The resource name.		4.6.0
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		4.6.0
zoneUuid	String	body (contained in the params structure)	The zone UUID.		4.6.0
clusterUuid	String	body (contained in the params structure)	The cluster UUID.		4.6.0
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		4.6.0
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID list.		4.6.0
systemTags	List	body	Optional. The system tags.		4.6.0
userTags	List	body	Optional. The user tags.		4.6.0

API Response

Sample Response

```
{
```

```

"inventory": {
  "name": "test",
  "description": "test desc",
  "zoneUuid": "1eca7fc3081a3750b55930b194d82991",
  "clusterUuid": "e73c4aa3e6a03ee3bb4f325ab3b395b1"
}

```

Name	Type	Description	Starting Version
success	boolean		4.6.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.6.0
inventory	AffinityGroupInventory	See inventory .	4.6.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.6.0
description	String	The brief description of the error.	4.6.0
details	String	The details about the error.	4.6.0
elaboration	String	The reserved field. Default value: null.	4.6.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.6.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.6.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	4.6.0
name	String	The resource name.	4.6.0
description	String	The detailed description of the resource.	4.6.0
zoneUuid	String	The zone UUID.	4.6.0
clusterUuid	String	The cluster UUID.	4.6.0
createDate	Timestamp	The creation date.	4.6.0
lastOpDate	Timestamp	The last operation date.	4.6.0

SDK Sample

Java SDK

```
CreateHostSchedulingRuleGroupAction action = new CreateHostSchedulingRuleGroupAction();
action.name = "test";
action.description = "test desc";
action.zoneUuid = "4e083eaa197835778fa94d9bfcf012d6";
action.clusterUuid = "e7127ff00fbb3ed3a9755c37447b7bf8";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateHostSchedulingRuleGroupAction.Result res = action.call();
```

Python SDK

```
CreateHostSchedulingRuleGroupAction action = CreateHostSchedulingRuleGroupAction()
action.name = "test"
action.description = "test desc"
action.zoneUuid = "4e083eaa197835778fa94d9bfcf012d6"
action.clusterUuid = "e7127ff00fbb3ed3a9755c37447b7bf8"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
CreateHostSchedulingRuleGroupAction.Result res = action.call()
```

5.1.5.2 DeleteHostSchedulingRuleGroup

API Request

URLs

```
DELETE zstack/v1/hostSchedulingRuleGroup/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/
hostSchedulingRuleGroup/8e02276953ab35e2b591505b0f3167c9
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		4.6.0
systemTags	List	body	Optional. The system tags.		4.6.0
userTags	List	body	Optional. The user tags.		4.6.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DeleteHostSchedulingRuleGroupAction action = new DeleteHostSchedulingRuleGroupAction();
action.uuid = "8e02276953ab35e2b591505b0f3167c9";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteHostSchedulingRuleGroupAction.Result res = action.call();
```

Python SDK

```
DeleteHostSchedulingRuleGroupAction action = DeleteHostSchedulingRuleGroupAction()
action.uuid = "8e02276953ab35e2b591505b0f3167c9"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteHostSchedulingRuleGroupAction.Result res = action.call()
```

5.1.5.3 UpdateHostSchedulingRuleGroup

API Request

URLs

```
PUT zstack/v1/hostSchedulingRuleGroup/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateHostSchedulingRuleGroup": {
    "name": "test",
    "description": "desc"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X PUT -d '{"updateHostSchedulingRuleGroup":
{"name":"test","description":"desc"}}' http://localhost:8080/zstack/
v1/hostSchedulingRuleGroup/7127bed5295f3a3c94d9b3dbc307450d
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		4.6.0
name	String	body (contained in the updateHost Scheduling RuleGroup structure)	Optional. The resource name.		4.6.0
description	String	body (contained in the updateHost Scheduling RuleGroup structure)	Optional. The detailed description of the resource.		4.6.0
systemTags	List	body	Optional. The system tags.		4.6.0
userTags	List	body	Optional. The user tags.		4.6.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "b96c8635e48435eca42d3cbfca25704f",
    "name": "test",
    "description": "desc",
    "zoneUuid": "afcd30e31ebb38a8b0a2f013fce73f7a",
    "clusterUuid": "ae9b2f516fd43913b1d458ebe5f7222d"
  }
}
```

Name	Type	Description	Starting Version
success	boolean		4.6.0

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error	4.6.0
inventory	AffinityGroupInventory	See inventory	4.6.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.6.0
description	String	The brief description of the error.	4.6.0
details	String	The details about the error.	4.6.0
elaboration	String	The reserved field. Default value: null.	4.6.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.6.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.6.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	4.6.0
name	String	The resource name.	4.6.0

Name	Type	Description	Starting Version
description	String	The detailed description of the resource.	4.6.0
zoneUuid	String	The zone UUID.	4.6.0
clusterUuid	String	The cluster UUID.	4.6.0
createDate	Timestamp	The creation date.	4.6.0
lastOpDate	Timestamp	The last operation date.	4.6.0

SDK Sample

Java SDK

```
UpdateHostSchedulingRuleGroupAction action = new UpdateHostSchedulingRuleGroupAction();
action.uuid = "7127bed5295f3a3c94d9b3dbc307450d";
action.name = "test";
action.description = "desc";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateHostSchedulingRuleGroupAction.Result res = action.call();
```

Python SDK

```
UpdateHostSchedulingRuleGroupAction action = UpdateHostSchedulingRuleGroupAction()
action.uuid = "7127bed5295f3a3c94d9b3dbc307450d"
action.name = "test"
action.description = "desc"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateHostSchedulingRuleGroupAction.Result res = action.call()
```

5.1.5.4 AddHostToHostSchedulingRuleGroup

API Request

URLs

```
POST zstack/v1/hostSchedulingRuleGroup/{hostGroupUuid}/host/{hostUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X POST http://localhost:8080/zstack/v1/
hostSchedulingRuleGroup/801af67a7f1f3610a76e834e45aebf5b/
host/602ca3d56dca40fcb04944dbaa9861ee
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
hostGroupUuid	String	url	The hostGroup UUID.		4.6.0
hostUuid	String	body	The host UUID.		4.6.0
systemTags	List	body	Optional. The system tags.		4.6.0
userTags	List	body	Optional. The user tags.		4.6.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
AddHostTohostSchedulingRuleGroupAction action = new AddHostTohostSchedulingRuleGroupAction();
action.hostGroupUuid = "663fb7c5b74f3bc9bf629ca3523fb8cc";
action.hostUuid = "64d7de2d3eb431c99998292d1ed5411e";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
AddHostTohostSchedulingRuleGroupAction.Result res = action.call();
```

Python SDK

```
AddHostTohostSchedulingRuleGroupAction action = AddHostTohostSchedulingRuleGroupAction()
action.hostGroupUuid = "663fb7c5b74f3bc9bf629ca3523fb8cc"
action.hostUuid = "64d7de2d3eb431c99998292d1ed5411e"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
AddHostTohostSchedulingRuleGroupAction.Result res = action.call()
```

5.1.5.5 DetachHostFromHostSchedulingRuleGroup

API Request

URLs

```
DELETE zstack/v1/hostSchedulingRuleGroup/{hostGroupUuid}/host
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/
hostSchedulingRuleGroup/801af67a7f1f3610a76e834e45aebf5b/host
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
hostGroupUuid	String	url	The UUID of the host scheduling group.		4.6.0
hostUuid	String	body	The host UUID.		4.6.0
systemTags	List	body	Optional. The system tags.		4.6.0
userTags	List	body	Optional. The user tags.		4.6.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DetachHostFromHostSchedulingRuleGroupAction action = new DetachHost
FromHostSchedulingRuleGroupAction();
action.hostGroupUuid = "801af67a7f1f3610a76e834e45aebf5b";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DetachHostFromHostSchedulingRuleGroupAction.Result res = action.call
();
```

Python SDK

```
DetachHostFromHostSchedulingRuleGroupAction action = DetachHost
FromHostSchedulingRuleGroupAction()
action.hostGroupUuid = "801af67a7f1f3610a76e834e45aebf5b"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DetachHostFromHostSchedulingRuleGroupAction.Result res = action.call()
```

5.1.5.6 CreateVmSchedulingRuleGroup

API Request

URLs

```
POST zstack/v1/vmSchedulingRuleGroup
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "zoneUuid": "eae13168e86b3698807837ca88c3b2ae",
    "name": "test",
    "description": "test desc"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
```

```
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"zoneUuid":"eae13168e86b3698807837ca88c3b2ae","name":"test","description":"test
desc"}}' http://localhost:8080/zstack/v1/vmSchedulingRuleGroup
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
zoneUuid	String	body (contained in the params structure)	The zone UUID.		4.6.0
name	String	body (contained in the params structure)	The resource name.		4.6.0
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		4.6.0
resourceUuid	String	body (contained in the params structure)	The resource UUID.		4.6.0
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID list.		4.6.0
systemTags	List	body	Optional. The system tags.		4.6.0
userTags	List	body	Optional. The user tags.		4.6.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "e79dc7a0170c31d18429c7478772c5d7",
    "name": "test",
    "description": "test desc",
    "appliance": "CUSTOMER",
```

```

    "zoneUuid": "e6a7cd7917473bedbfd420797d93ed50"
  }
}

```

Name	Type	Description	Starting Version
success	boolean		4.6.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.6.0
inventory	AffinityGroupInventory	See inventory	4.6.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.6.0
description	String	The brief description of the error.	4.6.0
details	String	The details about the error.	4.6.0
elaboration	String	The reserved field. Default value: null.	4.6.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.6.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.6.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	4.6.0
name	String	The resource name.	4.6.0
description	String	The detailed description of the resource.	4.6.0
appliance	String		4.6.0
zoneUuid	String	The zone UUID.	4.6.0
createDate	Timestamp	The creation date.	4.6.0
lastOpDate	Timestamp	The last operation date.	4.6.0

SDK Sample

Java SDK

```
CreateVmSchedulingRuleGroupAction action = new CreateVmSchedulingRuleGroupAction();
action.zoneUuid = "eae13168e86b3698807837ca88c3b2ae";
action.name = "test";
action.description = "test desc";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateVmSchedulingRuleGroupAction.Result res = action.call();
```

Python SDK

```
CreateVmSchedulingRuleGroupAction action = CreateVmSchedulingRuleGroupAction()
action.zoneUuid = "eae13168e86b3698807837ca88c3b2ae"
action.name = "test"
action.description = "test desc"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
CreateVmSchedulingRuleGroupAction.Result res = action.call()
```

5.1.5.7 DeleteVmSchedulingRuleGroup

API Request

URLs

```
DELETE zstack/v1/vmSchedulingRuleGroup/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/vmSchedulingRuleGroup/
d150bf5dca4c32768464817ab2937ac4
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		4.6.0
systemTags	List	body	Optional. The system tags.		4.6.0
userTags	List	body	Optional. The user tags.		4.6.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DeleteVmSchedulingRuleGroupAction action = new DeleteVmSchedulingRuleGroupAction();
action.uuid = "d150bf5dca4c32768464817ab2937ac4";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteVmSchedulingRuleGroupAction.Result res = action.call();
```

Python SDK

```
DeleteVmSchedulingRuleGroupAction action = DeleteVmSchedulingRuleGroupAction()
action.uuid = "d150bf5dca4c32768464817ab2937ac4"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteVmSchedulingRuleGroupAction.Result res = action.call()
```

5.1.5.8 UpdateVmSchedulingRuleGroup

API Request

URLs

```
PUT zstack/v1/vmSchedulingRuleGroup/{uuid}/update
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateVmSchedulingRuleGroup": {
    "name": "test",
    "description": "test desc"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X PUT -d '{"updateVmSchedulingRuleGroup":
{"name":"test","description":"test desc"}}' http://
localhost:8080/zstack/v1/
vmSchedulingRuleGroup/0e8a74e4ff8d3da9bffa07f0cc7d58f91/update
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		4.6.0
name	String	body (contained in the updateVmSchedulingRuleGroup structure)	Optional. The resource name.		4.6.0
description	String	body (contained in the updateVmSchedulingRuleGroup structure)	Optional. The detailed description of the resource.		4.6.0
systemTags	List	body	Optional. The system tags.		4.6.0
userTags	List	body	Optional. The user tags.		4.6.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "75840459a5f83afebc36e605a3189289",
    "name": "test",
    "description": "test desc",
    "appliance": "CUSTOMER",
    "zoneUuid": "261246b65f253787b06a29c6c266543c"
  }
}
```

}

Name	Type	Description	Starting Version
success	boolean		4.6.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error	4.6.0
inventory	AffinityGroupInventory	See inventory	4.6.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.6.0
description	String	The brief description of the error.	4.6.0
details	String	The details about the error.	4.6.0
elaboration	String	The reserved field. Default value: null.	4.6.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.6.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.6.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	4.6.0

Name	Type	Description	Starting Version
name	String	The resource name.	4.6.0
description	String	The detailed description of the resource.	4.6.0
appliance	String		4.6.0
zoneUuid	String	The zone UUID.	4.6.0
createDate	Timestamp	The creation date.	4.6.0
lastOpDate	Timestamp	The last operation date.	4.6.0

SDK Sample

Java SDK

```
UpdateVmSchedulingRuleGroupAction action = new UpdateVmSchedulingRuleGroupAction();
action.uuid = "0e8a74e4ff8d3da9bffa07f0cc7d58f91";
action.name = "test";
action.description = "test desc";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateVmSchedulingRuleGroupAction.Result res = action.call();
```

Python SDK

```
UpdateVmSchedulingRuleGroupAction action = UpdateVmSchedulingRuleGroupAction()
action.uuid = "0e8a74e4ff8d3da9bffa07f0cc7d58f91"
action.name = "test"
action.description = "test desc"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateVmSchedulingRuleGroupAction.Result res = action.call()
```

5.1.5.9 AddVmToVmSchedulingRuleGroup

API Request

URLs

```
POST zstack/v1/vmSchedulingRuleGroup/{vmGroupUuid}/vmInstance/{vmUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X POST http://localhost:8080/zstack/v1/
vmSchedulingRuleGroup/663fb7c5b74f3bc9bf629ca3523fb8cc/
vmInstance/64d7de2d3eb431c99998292d1ed5411e
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vmGroupUuid	String	url	The VM scheduling group UUID.		4.6.0
vmUuid	String	url	The VM instance UUID.		4.6.0
systemTags	List	body	Optional. The system tags.		4.6.0
userTags	List	body	Optional. The user tags.		4.6.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
AddVmToVmSchedulingRuleGroupAction action = new AddVmToVmSchedulingRuleGroupAction();
action.vmGroupUuid = "663fb7c5b74f3bc9bf629ca3523fb8cc";
action.vmUuid = "64d7de2d3eb431c99998292d1ed5411e";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
AddVmToVmSchedulingRuleGroupAction.Result res = action.call();
```

Python SDK

```
AddVmToVmSchedulingRuleGroupAction action = AddVmToVmSchedulingRuleGroupAction()
action.vmGroupUuid = "663fb7c5b74f3bc9bf629ca3523fb8cc"
action.vmUuid = "64d7de2d3eb431c99998292d1ed5411e"
```

```
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
AddVmToVmSchedulingRuleGroupAction.Result res = action.call()
```

5.1.5.10 DetachVmFromVmSchedulingRuleGroup

API Request

URLs

```
DELETE zstack/v1/vmSchedulingRuleGroup/{vmGroupUuid}/vmInstance/
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/
vmSchedulingRuleGroup/90c8c8b53cfc302684532e1c447e0a16/vmInstance/
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vmGroupUuid	String	url	The VM scheduling group UUID.		4.6.0
vmUuid	String	body	The VM UUID.		4.6.0
systemTags	List	body	Optional. The system tags.		4.6.0
userTags	List	body	Optional. The user tags.		4.6.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DetachVmFromVmSchedulingRuleGroupAction action = new DetachVmFromVmSchedulingRuleGroupAction();
action.vmGroupUuid = "90c8c8b53cfc302684532e1c447e0a16";
action.vmUuid = "560967aeab103cedb06a4a8d440c8d3d";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DetachVmFromVmSchedulingRuleGroupAction.Result res = action.call();
```

Python SDK

```
DetachVmFromVmSchedulingRuleGroupAction action = DetachVmFromVmSchedulingRuleGroupAction()
action.vmGroupUuid = "90c8c8b53cfc302684532e1c447e0a16"
action.vmUuid = "560967aeab103cedb06a4a8d440c8d3d"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DetachVmFromVmSchedulingRuleGroupAction.Result res = action.call()
```

5.1.5.11 GetVmSchedulingRulesExecuteState

API Request

URLs

```
POST zstack/v1/get/vmSchedulingRules/conflict/state
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "uuids": [
      "c6bb1e89239235f8b49bb10bc5d484cc"
    ]
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json; charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"uuids":["c6bb1e89239235f8b49bb10bc5d484cc"]}}'
http://localhost:8080/zstack/v1/get/vmSchedulingRules/conflict/state
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuids	List	body (contained in the params structure)	The VM scheduling group UUID.		4.6.0
systemTags	List	body	Optional. The system tags.		4.6.0
userTags	List	body	Optional. The user tags.		4.6.0

API Response

Sample Response

```
{
  "ruleMapState": {
    "2951e237b86630ac84d8eeb382513260": "Normal"
  }
}
```

Name	Type	Description	Starting Version
success	boolean		
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error	4.6.0
ruleMapState	Map	See ruleMapState	4.6.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.6.0
description	String	The brief description of the error.	4.6.0
details	String	The details about the error.	4.6.0
elaboration	String	The reserved field. Default value: null.	4.6.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.6.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.6.0

#ruleMapState

Name	Type	Description	Starting Version
Conflict	VmSchedulingRuleExecuteState	The conflict state.	4.6.0
Normal	VmSchedulingRuleExecuteState	The normal state.	4.6.0
Invalid	VmSchedulingRuleExecuteState	The invalid state.	4.6.0

SDK Sample

Java SDK

```
GetVmSchedulingRulesExecuteStateAction action = new GetVmSchedulingRulesExecuteStateAction();
action.uuids = asList("c6bb1e89239235f8b49bb10bc5d484cc");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
GetVmSchedulingRulesExecuteStateAction.Result res = action.call();
```

Python SDK

```
GetVmSchedulingRulesExecuteStateAction action = GetVmSchedulingRules
ExecuteStateAction()
action.uuids = [c6bb1e89239235f8b49bb10bc5d484cc]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetVmSchedulingRulesExecuteStateAction.Result res = action.call()
```

5.1.5.12 CreateVmSchedulingRule

API Request

URLs

```
POST zstack/v1/vmsSchedulingRule
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "rule": "AFFINITY",
    "mode": "SOFT",
    "vmGroupUuid": "814bca77193f3e7a871891b17f8e4122",
    "hostGroupUuid": "e4241841b9083aed84726be7cbb966bf",
    "name": "vm-scheduling-rule",
    "description": "desc"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"rule":"AFFINITY","mode":"SOFT","vmGroupUuid":"814bca77193f3e7a871891b17f8e4122",
"scheduling-rule","description":"desc"}}' http://localhost:8080/zstack/
v1/vmsSchedulingRule
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
rule	String	body (contained in the params structure)	The VM scheduling rule.	- AFFINITY - ANTI AFFINITY	4.6.0
mode	String	body (contained in the params structure)	The execution mode.	- SOFT - HARD	4.6.0
vmGroupUuid	String	body (contained in the params structure)	The VM scheduling group UUID.		4.6.0
hostGroupUuid	String	body (contained in the params structure)	The host scheduling group UUID.		4.6.0
name	String	body (contained in the params structure)	The resource name.		4.6.0
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		4.6.0
policy	String	body (contained in the params structure)		- antiSoft - antiHard	4.6.0
type	String	body (contained in the params structure)		host	4.6.0
zoneUuid	String	body (contained in the params structure)	Optional. The zone UUID.		4.6.0

Name	Type	Location	Description	Optional Value	Starting Version
subType	String	body (contained in the params structure)			4.6.0
resourceUuid	String	body (contained in the params structure)	The resource UUID.		4.6.0
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID list.		4.6.0
systemTags	List	body	Optional. The system tags.		4.6.0
userTags	List	body	Optional. The user tags.		4.6.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "d517b42f669b324288fe8977a7df2e4d",
    "name": "affinity-group-test",
    "description": "affinity group for test",
    "policy": "ANTISOFT",
    "version": "1.0",
    "type": "HOST"
  }
}
```

Name	Type	Description	Starting Version
success	boolean		4.6.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.6.0
inventory	AffinityGroupInventory	See inventory .	4.6.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.6.0
description	String	The brief description of the error.	4.6.0
details	String	The details about the error.	4.6.0
elaboration	String	The reserved field. Default value: null.	4.6.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.6.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.6.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	4.6.0
name	String	The resource name.	4.6.0
description	String	The detailed description of the resource.	4.6.0
policy	String		4.6.0
version	String		4.6.0
type	String		4.6.0
appliance	String		4.6.0
state	String		4.6.0
createDate	Timestamp	The creation date.	4.6.0

Name	Type	Description	Starting Version
lastOpDate	Timestamp	The last operation date.	4.6.0
usages	List	See usages.	4.6.0

#usages

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	4.6.0
affinityGroupUuid	String		4.6.0
resourceUuid	String		4.6.0
resourceType	String		4.6.0
createDate	Timestamp	The creation date.	4.6.0
lastOpDate	Timestamp	The last operation date.	4.6.0

SDK Sample

Java SDK

```
CreateVmSchedulingRuleAction action = new CreateVmSchedulingRuleAction
();
action.rule = "AFFINITY";
action.mode = "SOFT";
action.vmGroupUuid = "814bca77193f3e7a871891b17f8e4122";

action.name = "vm-scheduling-rule";
action.description = "desc";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateVmSchedulingRuleAction.Result res = action.call();
```

Python SDK

```
CreateVmSchedulingRuleAction action = CreateVmSchedulingRuleAction()
action.rule = "AFFINITY"
action.mode = "SOFT"
action.vmGroupUuid = "814bca77193f3e7a871891b17f8e4122"
action.hostGroupUuid = "e4241841b9083aed84726be7cbb966bf"
action.name = "vm-scheduling-rule"
action.description = "desc"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
CreateVmSchedulingRuleAction.Result res = action.call()
```

5.1.5.13 RemoveVmSchedulingRule

API Request

URLs

```
DELETE zstack/v1/vmSchedulingRule/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/vmSchedulingRule/
b247592a7e773a338a8965dc0d2cfffad
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		4.6.0
deleteMode	String	body	Optional. The deletion mode.	• Permissive • Enforcing • Permissive	4.6.0
systemTags	List	body	Optional. The system tags.		4.6.0
userTags	List	body	Optional. The user tags.		4.6.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
RemoveVmSchedulingRuleAction action = new RemoveVmSchedulingRuleAction();
action.uuid = "b247592a7e773a338a8965dc0d2cfffad";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
RemoveVmSchedulingRuleAction.Result res = action.call();
```

Python SDK

```
RemoveVmSchedulingRuleAction action = RemoveVmSchedulingRuleAction()
action.uuid = "b247592a7e773a338a8965dc0d2cfffad"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
RemoveVmSchedulingRuleAction.Result res = action.call()
```

5.1.5.14 ChangeVmSchedulingRuleState

API Request

URLs

```
PUT zstack/v1/vmSchedulingRule/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeVmSchedulingRuleState": {
    "state": "enable"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X PUT -d '{"changeVmSchedulingRuleState":
{"state":"enable"}}' http://localhost:8080/zstack/v1/
vmSchedulingRule/907848e59a963a97a237c6dcb26d96ba/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		4.6.0
state	String	body (contained in the changeVmSchedulingRuleState structure)	The state after the modification.	- enable - disable	4.6.0
systemTags	List	body	Optional. The system tags.		4.6.0
userTags	List	body	Optional. The user tags.		4.6.0

API Response

Sample Response

```
{
  "inventory": {
    "rule": "AFFINITY",
    "mode": "SOFT",
    "uuid": "8ab474e792183589b6a58bbe473c635a",
    "name": "Test-AffinityGroup",
    "description": "Test-AffinityGroup",
    "version": "1.0",
    "type": "HOST",
    "appliance": "CUSTOMER",
    "createDate": "Nov 14, 2017 10:20:57 PM",

SDK Sample

Java SDK

```
UpdateVmSchedulingRuleAction action = new UpdateVmSchedulingRuleAction
();
action.uuid = "5c23ac3de87f33ff955430556e9d1104";
action.name = "new name";
action.description = "desc";
action.mode = "SOFT";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateVmSchedulingRuleAction.Result res = action.call();
```

Python SDK

```
UpdateVmSchedulingRuleAction action = UpdateVmSchedulingRuleAction()
action.uuid = "5c23ac3de87f33ff955430556e9d1104"
action.name = "new name"
```

```

action.description = "desc"
action.mode = "SOFT"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateVmSchedulingRuleAction.Result res = action.call()

```

5.1.5.16 ValidateVmSchedulingRule

API Request

URLs

```
PUT zstack/v1/validate/vmSchedulingRule
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```

{
  "validateVmSchedulingRule": {
    "vmGroupUuid": "2bce1a0af86a3ceebd70ef1aaa3633d1",
    "hostGroupUuid": "15b9f0a9a3c43708890eef7552959746",
    "rule": "AFFINITY",
    "mode": "HARD",
    "zoneUuid": "538bdbde4d9d3b919e2cc9ae44542f09"
  },
  "systemTags": [],
  "userTags": []
}

```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"validateVmSchedulingRule":
{"vmGroupUuid":"2bce1a0af86a3ceebd70ef1aaa3633d1","hostGroupUuid":"15b9f0a9a3c43708890eef7552959746",
http://localhost:8080/zstack/v1/validate/vmSchedulingRule

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vmGroupUuid	String	body (contained in the	The VM scheduling group UUID.		4.6.0

Name	Type	Location	Description	Optional Value	Starting Version
		validateVm Scheduling Rule structure)			
hostGroupU uid	String	body (contained in the validateVm Scheduling Rule structure)	Optional. The host scheduling group UUID.		4.6.0
rule	String	body (contained in the validateVm Scheduling Rule structure)	The VM scheduling rule.	• AFFINITY • ANTIAFFINITY	4.6.0
mode	String	body (contained in the validateVm Scheduling Rule structure)	The execution mode of the rule.	• SOFT • HARD	4.6.0
zoneUuid	String	body (contained in the validateVm Scheduling Rule structure)	Optional. The zone UUID.		4.6.0
systemTags	List	body	Optional. The system tags.		4.6.0
userTags	List	body	Optional. The user tags.		4.6.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
ValidateVmSchedulingRuleAction action = new ValidateVmScheduling
RuleAction();
action.vmGroupUuid = "2bce1a0af86a3ceebd70ef1aaa3633d1";
action.hostGroupUuid = "15b9f0a9a3c43708890eef7552959746";
action.rule = "AFFINITY";
action.mode = "HARD";
action.zoneUuid = "538bdbde4d9d3b919e2cc9ae44542f09";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
ValidateVmSchedulingRuleAction.Result res = action.call();
```

Python SDK

```
ValidateVmSchedulingRuleAction action = ValidateVmSchedulingRuleAction
()
action.vmGroupUuid = "2bce1a0af86a3ceebd70ef1aaa3633d1"
action.hostGroupUuid = "15b9f0a9a3c43708890eef7552959746"
action.rule = "AFFINITY"
action.mode = "HARD"
action.zoneUuid = "538bdbde4d9d3b919e2cc9ae44542f09"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
ValidateVmSchedulingRuleAction.Result res = action.call()
```

5.1.6 Instance Offering Operations

5.1.6.1 CreateInstanceOffering

API Request

URLs

```
POST zstack/v1/instance-offerings
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "instanceOffering",
    "cpuNum": 2.0,
    "memorySize": 2097152.0,
    "sortKey": 0.0,
    "type": "UserVm"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"name":"instanceOffering","cpuNum":2.0,"memorySize":2097152.0,"sortKey":0.0,"type":
"http://localhost:8080/zstack/v1/instance-offerings
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in	The resource name.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
		the params structure)			
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		0.6
cpuNum	int	body (contained in the params structure)	The CPU count.		0.6
memorySize	long	body (contained in the params structure)	The memory size. Unit: byte		0.6
allocatorStrategy	String	body (contained in the params structure)	Optional. The allocator strategy.	- DefaultHostAllocatorStrategy - LastHostPreferredAllocatorStrategy - LeastVmPreferredHostAllocatorStrategy - MinimumCPUUsageHostAllocatorStrategy - MinimumMemoryUsageHostAllocatorStrategy - MaxInstancePerHostHostAllocatorStrategy	0.6

Name	Type	Location	Description	Optional Value	Starting Version
sortKey	int	body (contained in the params structure)	Optional. The sort key.		0.6
type	String	body (contained in the params structure)	Optional. The type.		0.6
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

**Note:**

- When you create an instance offering in ZStack Cloud, you can add a GPU specification by adding the **pciRom** option to **SystemTags**.
 - Format of the **pciRom** option: `pciRomUuid::UUID`. Here, the UUID is the UUID of the PCI device firmware.
 - Example: `pciRomUuid::5fd71606d5af451d981413f35367a8d6`
- When you create an instance offering in ZStack Cloud, you can customize the instance offering parameters by adding the **instanceOfferingUserConfig** option to **SystemTags**.
 - Format of the **instanceOfferingUserConfig** option: `instanceOfferingUserConfig::xxx`. Here, xxx must be a JSON string.

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "d04e02a97d6c4ad0b0acee2a2f6c7084",
    "name": "instanceOffering1",
    "cpuNum": 2.0,
```

```

"cpuSpeed": 1.0,
"type": "UserVm",
"allocatorStrategy": "Mevoco",
"createDate": "Jun 7, 2017 9:20:40 PM",
"lastOpDate": "Jun 7, 2017 9:20:40 PM",
"state": "Enabled"
}
}

```

Name	Type	Description	Starting Version

type	String	The type.	0.6
allocatorStrategy	String	The allocator strategy.	0.6
sortKey	Integer		0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6
state	String	The state, including Enabled and Disabled.	0.6

SDK Sample

Java SDK

```
CreateInstanceOfferingAction action = new CreateInstanceOfferingAction();
action.name = "instanceOffering";
action.cpuNum = 2.0;
action.memorySize = 2097152.0;
action.sortKey = 0.0;
action.type = "UserVm";
action.sessionId = "1567ec4024724d2ea60eba29b957158c";
CreateInstanceOfferingAction.Result res = action.call();
```

Python SDK

```
CreateInstanceOfferingAction action = CreateInstanceOfferingAction()
action.name = "instanceOffering"
action.cpuNum = 2.0
action.memorySize = 2097152.0
action.sortKey = 0.0
action.type = "UserVm"
action.sessionId = "427dd2d091a54a09999e7e31eac07fc83"
```

```
CreateInstanceOfferingAction.Result res = action.call()
```

5.1.6.2 DeleteInstanceOffering

API Request

URLs

```
DELETE zstack/v1/instance-offerings/{uuid}?deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth cd94b78dc89842c19ea248ddb04816c0" \
-X DELETE http://localhost:8080/zstack/v1/instance-offerings/
d4061032ef3940b990ba671acd1221fc?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
deleteMode	String	body	Optional. The delete mode.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DeleteInstanceOfferingAction action = new DeleteInstanceOfferingAction();
action.uuid = "07ce817b8d9d4f629c2bd65daae9b7bb";
action.deleteMode = "Permissive";
action.sessionId = "fd2aa30babca411780c7df97d3ae6f9f";
DeleteInstanceOfferingAction.Result res = action.call();
```

Python SDK

```
DeleteInstanceOfferingAction action = DeleteInstanceOfferingAction()
action.uuid = "694e24b4a64d4b45936a9bbcf878078b"
action.deleteMode = "Permissive"
action.sessionId = "a13ac6edf7f546e48c4dbfea66429610"
DeleteInstanceOfferingAction.Result res = action.call()
```

5.1.6.3 QueryInstanceOffering

API Request

URLs

```
GET zstack/v1/instance-offerings
GET zstack/v1/instance-offerings/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth d4743a8bc4eb4dd7a827c58e20437e85" \
-X GET http://localhost:8080/zstack/v1/instance-offerings?
q=uuid=3695f87b54594284b9ce542b2b653fb7
```

```

5.1.6.4 ChangeInstanceOffering

API Request

URLs

```
PUT zstack/v1/vm-instances/{vmInstanceUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeInstanceOffering": {
    "instanceOfferingUuid": "818e8cad0af948baa9b8e7d8d7116abb"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"changeInstanceOffering":
{"instanceOfferingUuid":"7c46b8e59bf63b5f94fda63fce797581"}}' \
http://localhost:8080/zstack/v1/vm-
instances/6b322ba8e03136e6bf200431e550d1a6/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vmInstanceUuid	String	url	The VM instance UUID.		0.6
instanceOfferingUuid	String	body (contained)	The instance offering UUID.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
		in the changeInstanceOffering structure			
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
ChangeInstanceOfferingAction action = new ChangeInstanceOfferingAction();
action.vmInstanceId = "c63937d254e24da1b06afc433b0e27ff";

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
stateEvent	String	body (contained in the changeInstanceOfferingState structure)	The state event.	- enable - disable	0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "372d111a940b46b39da8c32c5629ba66",
    "name": "instanceOffering1",
    "cpuNum": 2.0,
    "cpuSpeed": 1.0,
    "type": "UserVm",
    "allocatorStrategy": "Mevoco",
    "createDate": "Jun 7, 2017 9:20:36 PM",
    "lastOpDate": "Jun 7, 2017 9:20:36 PM",
    "state": "Enabled"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventory	InstanceOfferingInventory	See inventory .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
name	String	The resource name.	0.6
description	String	The detailed description of the resource.	0.6
cpuNum	Integer	The CPU count.	0.6
cpuSpeed	Integer	The CPU speed.	0.6
memorySize	Long	The memory size.	0.6
type	String	The type.	0.6
allocatorStrategy	String	The allocator strategy.	0.6
sortKey	Integer		0.6
createDate	Timestamp	The creation date.	0.6

Name	Type	Description	Starting Version
lastOpDate	Timestamp	The last operation date.	0.6
state	String	The state, including Enabled and Disabled.	0.6

SDK Sample

Java SDK

```
ChangeInstanceOfferingStateAction action = new ChangeInstanceOfferingStateAction();
action.uuid = "ca7a911366f74e9b8e4222785cf963a1";
action.stateEvent = "enable";
action.sessionId = "86cf8ce78421434eb9458504f7449c64";
ChangeInstanceOfferingStateAction.Result res = action.call();
```

Python SDK

```
ChangeInstanceOfferingStateAction action = ChangeInstanceOfferingStateAction()
action.uuid = "5cfc5009c0b74319855ccd197fa04a16"
action.stateEvent = "enable"
action.sessionId = "c593d4f452fd498cb60679a0956f1929"
ChangeInstanceOfferingStateAction.Result res = action.call()
```

5.1.7 Disk Offering Operations

5.1.7.1 CreateDiskOffering

API Request

URLs

```
POST zstack/v1/disk-offerings
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "diskOffering1",
    "diskSize": 100.0,
    "sortKey": 0.0
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"name":"diskOffering1","diskSize":100.0,"sortKey":0.0}}' \
http://localhost:8080/zstack/v1/disk-offerings
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The resource name.		0.6
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		0.6
diskSize	long	body (contained in the params structure)	The volume size.		0.6
sortKey	int	body (contained in the params structure)	Optional. The sort key.		0.6
allocation Strategy	String	body (contained in the params structure)	Optional. The allocation strategy.	- DefaultHostAllocator Strategy - LastHostPreferredAll oculatorStra tegy	0.6

Name	Type	Location	Description	Optional Value	Starting Version
				- LeastVmPreferredHostAllocatorStrategy - MinimumCPUUsageHostAllocatorStrategy - MinimumMemoryUsageHostAllocatorStrategy - MaxInstancePerHostHostAllocatorStrategy - LeastVolumePrimaryStorageAllocationStrategy - MaximumAvailableCapacityAllocationStrategy - CustomOrderPrimaryStorageAllocationStrategy	
type	String	body (contained in the params structure)	Optional. The type.		0.6
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

**Note:**

- When you create a disk offering in ZStack Cloud, you can customize the disk offering parameters by adding the **diskOfferingUserConfig** option to **SystemTags**.
 - Format of the **diskOfferingUserConfig** option: `diskOfferingUserConfig::xxx`. Here, xxx must be a JSON string.

For example, to specify multiple primary storage for a disk offering, you can use `diskOfferingUserConfig::`

```
{
  "allocate": {
    "primaryStorages": [
      {
        "type": "Enter a primary storage type",
        "uuid": "Enter a primary storage UUID"
      },
      {
        "type": "Enter a primary storage type",
        "uuid": "Enter a primary storage UUID"
      },
      {
        "type": "Enter a primary storage type",
        "uuid": "Enter a primary storage UUID"
      }
    ]
  }
}
```

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "e7a865815cd34dd29812d335dc1019bf",
    "name": "diskOffering1",
    "diskSize": 100.0,
    "state": "Enabled",
    "type": "DefaultDiskOfferingType",
    "allocatorStrategy": "DefaultPrimaryStorageAllocationStrategy"
  }
}
```

}

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventory	DiskOfferingInventory	See inventory .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
name	String	The resource name.	0.6

Name	Type	Description	Starting Version
description	String	The detailed description of the resource.	0.6
diskSize	Long	The volume size.	0.6
sortKey	Integer		0.6
state	String	The state, including Enabled and Disabled.	0.6
type	String	The type.	0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6
allocatorStrategy	String	The allocator strategy.	0.6

SDK Sample

Java SDK

```
CreateDiskOfferingAction action = new CreateDiskOfferingAction();
action.name = "diskOffering1";
action.diskSize = 100.0;
action.sortKey = 0.0;
action.sessionId = "5c780b5178c0432b9f86a758c4c75ea1";
CreateDiskOfferingAction.Result res = action.call();
```

Python SDK

```
CreateDiskOfferingAction action = CreateDiskOfferingAction()
action.name = "diskOffering1"
action.diskSize = 100.0
action.sortKey = 0.0
action.sessionId = "f930e0f78ce948778c8c3f1cbcd0c4ec"
```

```
CreateDiskOfferingAction.Result res = action.call()
```

5.1.7.2 DeleteDiskOffering

API Request

URLs

```
DELETE/v1/disk-offerings/{uuid}?deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth e12cbd12fbd54afd96c463c093ce1ed9" \
-X DELETE http://localhost:8080/zstack/v1/disk-offerings/6313fb03124a4aa6b7f77d8d153c0bcb?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
deleteMode	String	body	Optional. The delete mode.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DeleteDiskOfferingAction action = new DeleteDiskOfferingAction();
action.uuid = "1d4e09f16c7c45abaab80be172b26cc1";
action.deleteMode = "Permissive";
action.sessionId = "1a31abeef7e4ab5bc538168be6deb05";
DeleteDiskOfferingAction.Result res = action.call();
```

Python SDK

```
DeleteDiskOfferingAction action = DeleteDiskOfferingAction()
action.uuid = "4f0d2dc3a8f34685ad8543834bf4cfd8"
action.deleteMode = "Permissive"
action.sessionId = "dce93830769b427ca6edf3bda25f65f6"
DeleteDiskOfferingAction.Result res = action.call()
```

5.1.7.3 QueryDiskOffering

API Request

URLs

```
GET zstack/v1/disk-offerings
GET zstack/v1/disk-offerings/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth d6550daa638547498b8075f3ebd1e240" \
-X GET http://localhost:8080/zstack/v1/disk-offerings?
q=uuid=85c065f24d024bf3920766692da392eb
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 3b32284bc5344692a8bc77a43610f460" \
-X GET http://localhost:8080/zstack/v1/disk-
offerings/2f25294896e24c89b63edb7a209ebb85
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryDiskOffering`, and pressing the **Tab** key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "uuid": "7bd03741125a48d485255601b639318b",
      "name": "diskOffering1",
      "diskSize": 100.0,
      "state": "Enabled",
      "type": "DefaultDiskOfferingType",
      "allocatorStrategy": "DefaultPrimaryStorageAllocationStrategy"
    }
  ]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventories	List	See inventories .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6

SDK Sample

Java SDK

```
QueryDiskOfferingAction action = new QueryDiskOfferingAction();
action.conditions = asList("uuid=e01b8a266d05425ba2d0c05308763db8");
action.sessionId = "d8a3f3b62d8c4affab7c5d491f95d4de";
QueryDiskOfferingAction.Result res = action.call();
```

Python SDK

```
QueryDiskOfferingAction action = QueryDiskOfferingAction()
action.conditions = ["uuid=a1f7f68522e64783a37095a862f9bc28"]
action.sessionId = "593740538236497183e065e1251b6937"
```

```
QueryDiskOfferingAction.Result res = action.call()
```

5.1.7.4 ChangeDiskOfferingState

API Request

URLs

```
PUT zstack/v1/disk-offerings/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeDiskOfferingState": {
    "stateEvent": "enable"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"changeDiskOfferingState":{"stateEvent":"enable"}}' \
http://localhost:8080/zstack/v1/disk-offerings/39c32ae614e23ce2a6877797a09037fd/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
stateEvent	String	body (contained in the changeDisk	The state event.	- enable - disable	0.6

Name	Type	Location	Description	Optional Value	Starting Version
		OfferingState structure)

Java SDK

```
ChangeDiskOfferingStateAction action = new ChangeDiskOfferingStateAction();
action.uuid = "b99744228d4943959881b051cecb376d";
action.stateEvent = "enable";
```

```
action.sessionId = "8733eb947ada42bb8769ad170f889e98";
ChangeDiskOfferingStateAction.Result res = action.call();
```

Python SDK

```
ChangeDiskOfferingStateAction action = ChangeDiskOfferingStateAction()
action.uuid = "521d538a214c42e39d16cef5a1e13cc9"
action.stateEvent = "enable"
action.sessionId = "7e7ba75914814242a268026ca77163e5"
ChangeDiskOfferingStateAction.Result res = action.call()
```

5.1.7.5 UpdateDiskOffering

API Request

URLs

```
PUT zstack/v1/disk-offerings/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateDiskOffering": {
    "name": "new name"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateDiskOffering":{"name":"new name"}}' \
http://localhost:8080/zstack/v1/disk-offerings/1a2b9698ee163ad69374f765f6234f02/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
name	String	body (contained in the updateDisk Offering structure)	Optional. The resource name.		0.6
description	String	body (contained in the updateDisk Offering structure)	Optional. The detailed description of the resource.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "a156bb54daa544628f2abff419c76977",
    "name": "new name",

lastOpDate	Timestamp	The last operation date.	0.6
allocatorStrategy	String	The allocator strategy.	0.6

SDK Sample

Java SDK

```
UpdateDiskOfferingAction action = new UpdateDiskOfferingAction();
action.uuid = "21226fe14a8042d2ad1d37640c8a8594";
action.name = "new name";
action.sessionId = "c8e71fd622614f15b3452a8fa451d037";
UpdateDiskOfferingAction.Result res = action.call();
```

Python SDK

```
UpdateDiskOfferingAction action = UpdateDiskOfferingAction()
action.uuid = "30d4acc261f34c55a297a203fed852e2"
action.name = "new name"
action.sessionId = "0236ee9dd5d440de84f867e9d550172c"
UpdateDiskOfferingAction.Result res = action.call()
```

5.1.8 Auto-Scaling Group Operations

5.1.8.1 CreateAutoScalingGroup

API Request

URLs

```
POST zstack/v1/autoscaling/groups
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "test-group",
    "description": "just for test",
    "scalingResourceType": "VmInstance",
    "minResourceSize": 2.0,
    "maxResourceSize": 10.0,
    "defaultCooldown": 60.0,
    "removalPolicy": "OldestInstance",
    "defaultEnable": false
  },
  "systemTags": [],
```

```
"userTags": []
}
```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"name":"test-group","description":"just for
test","scalingResourceType":"VmInstance","minResourceSize":2.0,"maxResourceSize":
http://localhost:8080/zstack/v1/autoscaling/groups
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The resource name.		3.1.0
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		3.1.0
scalingResourceType	String	body (contained in the params structure)	The resource type of the auto scaling group. Current type: VM instance.	• VmInstance	3.1.0
minResourceSize	Integer	body (contained in the params structure)	The minimum number of VM instances in the auto scaling group.		3.1.0
maxResourceSize	Integer	body (contained in the params structure)	The maximum number of VM instances in the auto scaling group.		3.1.0

Name	Type	Location	Description	Optional Value	Starting Version
defaultCooldown	Long	body (contained in the params structure)	The default cooldown time of the auto scaling rule.		3.1.0
removalPolicy	String	body (contained in the params structure)	The policy for removing a VM instance.	• OldestInstance • NewestInstance • OldestScalingConfiguration • MinimumCPUUsageInstance • MinimumMemoryUsageInstance	3.1.0
defaultEnable	boolean	body (contained in the params structure)	Optional. Whether to enable the auto scaling group after creation.		3.1.0
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		3.1.0
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID list.		3.1.0
systemTags	List	body	Optional. The system tags.		3.1.0
userTags	List	body	Optional. The user tags.		3.1.0

API Response

Sample Response

```
{
  "inventory": {
    "name": "test-group",
    "uuid": "ff296e09f82e3a84af082257ff63d162",

    "createDate": "Nov 14, 2017 10:20:57 PM",
    "lastOpDate": "Nov 14, 2017 10:20:57 PM"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.1.0
inventory	AutoScalingGroupInventory	See inventory .	3.1.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.1.0
description	String	The brief description of the error.	3.1.0
details	String	The details about the error.	3.1.0
elaboration	String	The reserved field. Default value: null.	3.1.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.1.0
cause	ErrorCode	The root error, which is the associated root cause of the current	3.1.0

Name	Type	Description	Starting Version
		error. If no root error exists, this parameter is null.	

#inventory

Name	Type	Description	Starting Version
name	String	The resource name.	3.1.0
uuid	String	The resource UUID.	3.1.0
scalingResourceType	String	The resource type of the auto scaling group . Current type: VM instance.	3.1.0
state	String	The state of the auto scaling group.	3.1.0
defaultCooldown	Long	The default cooldown time of the auto scaling rule.	3.1.0
description	String	The detailed description of the resource.	3.1.0
minResourceSize	Integer	The minimum number of VM instances in the auto scaling group.	3.1.0
maxResourceSize	Integer	The maximum number of VM instances in the auto scaling group.	3.1.0
removalPolicy	String	The default policy for removing a VM instance.	3.1.0
createDate	Timestamp	The creation date.	3.1.0
lastOpDate	Timestamp	The last operation date.	3.1.0
attachedTemplates	List	The templates of VM instances attached to the auto scaling group.	3.1.0
systemTags	List		3.1.0

SDK Sample

Java SDK

```
CreateAutoScalingGroupAction action = new CreateAutoScalingGroupAction();
action.name = "test-group";
action.description = "just for test";
action.scalingResourceType = "VmInstance";
action.minResourceSize = 2.0;
action.maxResourceSize = 10.0;
action.defaultCooldown = 60.0;
action.removalPolicy = "OldestInstance";
action.defaultEnable = false;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateAutoScalingGroupAction.Result res = action.call();
```

Python SDK

```
CreateAutoScalingGroupAction action = CreateAutoScalingGroupAction()
action.name = "test-group"
action.description = "just for test"
action.scalingResourceType = "VmInstance"
action.minResourceSize = 2.0
action.maxResourceSize = 10.0
action.defaultCooldown = 60.0
action.removalPolicy = "OldestInstance"
action.defaultEnable = false
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CreateAutoScalingGroupAction.Result res = action.call()
```

5.1.8.2 DeleteAutoScalingGroup

API Request

URLs

```
DELETE zstack/v1/autoscaling/groups/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/autoscaling/
groups/09121b25fdf330538288d1ac81025563
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.1.0
systemTags	List	body	Optional. The system tags.		3.1.0
userTags	List	body	Optional. The user tags.		3.1.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteAutoScalingGroupAction action = new DeleteAutoScalingGroupAction();
action.uuid = "09121b25fdf330538288d1ac81025563";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteAutoScalingGroupAction.Result res = action.call();
```

Python SDK

```
DeleteAutoScalingGroupAction action = DeleteAutoScalingGroupAction()
action.uuid = "09121b25fdf330538288d1ac81025563"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
DeleteAutoScalingGroupAction.Result res = action.call()
```

5.1.8.3 UpdateAutoScalingGroup

API Request

URLs

```
PUT zstack/v1/autoscaling/groups/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateAutoScalingGroup": {
    "name": "test-group2"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateAutoScalingGroup":{"name":"test-group2"}}' http://localhost:8080/zstack/v1/autoscaling/groups/17a8d07735b631a688d6f95f3323fe91/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.1.0
name	String	body (contained in the updateAuto	Optional. The resource name.		3.1.0

Name	Type	Location	Description	Optional Value	Starting Version
		ScalingGroup structure)			
description	String	body (contained in the updateAutoScalingGroup structure)	Optional. The detailed description of the resource.		3.1.0
minResourceSize	Integer	body (contained in the updateAutoScalingGroup structure)	Optional. The minimum number of VM instances in the auto scaling group.		3.1.0
maxResourceSize	Integer	body (contained in the updateAutoScalingGroup structure)	Optional. The maximum number of VM instances in the auto scaling group.		3.1.0
removalPolicy	String	body (contained in the updateAutoScalingGroup structure)	Optional. The policy for removing a VM instance. The oldest and newest VM instances take precedence.	• OldestInstance • NewestInstance • OldestScalingConfiguration • MinimumCPUUsageInstance • MinimumMemoryUsageInstance	3.1.0
systemTags	List	body	Optional. The system tags.		3.1.0
userTags	List	body	Optional. The user tags.		3.1.0

API Response

Sample Response

```
{
  "inventory": {
    "name": "test-load-balance-profile",
    "uuid": "95f4b920e6b63e318940a44c0f47788e",
    "description": "just for test",
    "createDate": "Nov 14, 2017 10:20:57 PM",
    "lastOpDate": "Nov 14, 2017 10:20:57 PM"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.1.0
inventory	AutoScalingGroupInventory	See inventory .	3.1.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.1.0
description	String	The brief description of the error.	3.1.0
details	String	The details about the error.	3.1.0
elaboration	String	The reserved field. Default value: null.	3.1.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.1.0
cause	ErrorCode	The root error, which is the associated root cause of the current	3.1.0

Name	Type	Description	Starting Version
		error. If no root error exists, this parameter is null.	

#inventory

Name	Type	Description	Starting Version
name	String	The resource name.	3.1.0
uuid	String	The resource UUID.	3.1.0
scalingResourceType	String	The resource type of the auto scaling group . Current type: VM instance.	3.1.0
state	String	The state of the auto scaling group.	3.1.0
defaultCooldown	Long	The default cooldown time of the auto scaling rule.	3.1.0
description	String	The detailed description of the resource.	3.1.0
minResourceSize	Integer	The minimum number of VM instances in the auto scaling group.	3.1.0
maxResourceSize	Integer	The maximum number of VM instances in the auto scaling group.	3.1.0
removalPolicy	String	The default policy for removing a VM instance.	3.1.0
createDate	Timestamp	The creation date.	3.1.0
lastOpDate	Timestamp	The last operation date.	3.1.0
attachedTemplates	List	The templates of VM instances attached to the auto scaling group.	3.1.0
systemTags	List		3.1.0

SDK Sample

Java SDK

```
UpdateAutoScalingGroupAction action = new UpdateAutoScalingGroupAction();
action.uuid = "17a8d07735b631a688d6f95f3323fe91";
action.name = "test-group2";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateAutoScalingGroupAction.Result res = action.call();
```

Python SDK

```
UpdateAutoScalingGroupAction action = UpdateAutoScalingGroupAction()
action.uuid = "17a8d07735b631a688d6f95f3323fe91"
action.name = "test-group2"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateAutoScalingGroupAction.Result res = action.call()
```

5.1.8.4 QueryAutoScalingGroup

API Request

URLs

```
GET /v1/autoscaling/groups
```

```
GET /v1/autoscaling/groups/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
adjustment Type	String	body (contained in the params structure)	The scale-out method. Options: • Add a specified number of VM instances. • Add VM instances by percentage. • Add VM instances to a specified number.	• QuantityChangeInCapacity • PercentChangeInCapacity • TotalCapacity	3.1.0
adjustment Value	Integer	body (contained in the params structure)	The scale-out size.		3.1.0
name	String	body (contained in the params structure)	The resource name.		3.1.0
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		3.1.0
autoScalingGroupUuid	String	body (contained in the params structure)	The UUID of the auto scaling group.		3.1.0
type	String	body (contained in the params structure)	Optional. The type of the auto scaling rule.		3.1.0

Name	Type	Location	Description	Optional Value	Starting Version
cooldown	Long	body (contained in the params structure)	Optional. The cooldown time after the auto scaling rule is triggered.		3.1.0
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		3.1.0
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID list.		3.1.0
systemTags	List	body	Optional. The system tags.		3.1.0
userTags	List	body	Optional. The user tags.		3.1.0

API Response

Sample Response

```

SDK Sample

Java SDK

```

CreateAutoScalingGroupRemovalInstanceRuleAction action = new
CreateAutoScalingGroupRemovalInstanceRuleAction();
action.adjustmentType = "PercentChangeInCapacity";
action.adjustmentValue = 1.0;
action.removalPolicy = "MinimumMemoryUsageInstance";
action.name = "removalInstance";
action.description = "just for test";
action.autoScalingGroupUuid = "8a8070f9926733478acad7bf0ba60a63";
action.cooldown = 10.0;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";

```

```
CreateAutoScalingGroupRemovalInstanceRuleAction.Result res = action.call();
```

Python SDK

```
CreateAutoScalingGroupRemovalInstanceRuleAction action = CreateAutoScalingGroupRemovalInstanceRuleAction()
action.adjustmentType = "PercentChangeInCapacity"
action.adjustmentValue = 1.0
action.removalPolicy = "MinimumMemoryUsageInstance"
action.name = "removalInstance"
action.description = "just for test"
action.autoScalingGroupUuid = "8a8070f9926733478acad7bf0ba60a63"
action.cooldown = 10.0
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CreateAutoScalingGroupRemovalInstanceRuleAction.Result res = action.call()
```

5.1.8.8 DeleteAutoScalingRule

API Request

URLs

```
DELETE zstack/v1/autoscaling/rules/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/autoscaling/
rules/55774c4baaea33c4a47b16c772446077
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The UUID of the auto scaling rule.		3.1.0
systemTags	List	body	Optional. The system tags.		3.1.0
userTags	List	body	Optional. The user tags.		3.1.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteAutoScalingRuleAction action = new DeleteAutoScalingRuleAction
();
action.uuid = "55774c4baaea33c4a47b16c772446077";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteAutoScalingRuleAction.Result res = action.call();
```

Python SDK

```
DeleteAutoScalingRuleAction action = DeleteAutoScalingRuleAction()
action.uuid = "55774c4baaea33c4a47b16c772446077"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteAutoScalingRuleAction.Result res = action.call()
```

5.1.8.9 UpdateAutoScalingRule

API Request

URLs

```
PUT zstack/v1/autoscaling/rules/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateAutoScalingRule": {
    "name": "test name2"
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateAutoScalingRule":{"name":"test
name2"}}' http://localhost:8080/zstack/v1/autoscaling/
rules/4e8be98cd3a93176b9d38f3f934f1c2a/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.1.0
name	String	body (contained in the updateAutoScalingRule structure)	Optional. The resource name.		3.1.0
description	String	body (contained in the updateAutoScalingRule structure)	Optional. The detailed description of the resource.		3.1.0
cooldown	Long	body (contained in the updateAutoScalingRule structure)	Optional. The cooldown time.		3.1.0
systemTags	List	body	Optional. The system tags.		3.1.0
userTags	List	body	Optional. The user tags.		3.1.0

API Response

Sample Response

```
{
  "inventory": {
    "type": "HealthProfile",
    "description": "just for test",
    "cooldown": 10.0,

lastOpDate	Timestamp	The last operation date.	3.1.0

SDK Sample

Java SDK

```
QueryAutoScalingRuleAction action = new QueryAutoScalingRuleAction();
action.conditions = asList();
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryAutoScalingRuleAction.Result res = action.call();
```

Python SDK

```
QueryAutoScalingRuleAction action = QueryAutoScalingRuleAction()
action.conditions = []
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryAutoScalingRuleAction.Result res = action.call()
```

5.1.8.13 CreateAutoScalingRuleAlarmTrigger

API Request

URLs

```
POST zstack/v1/zwatch/alarms/{alarmUuid}/autoscaling/rules/{ruleUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "createAlarmTrigger"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"name":"createAlarmTrigger"}}'
http://localhost:8080/zstack/v1/zwatch/
```

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.1.0
description	String	The brief description of the error.	4.1.0
details	String	The details about the error.	4.1.0
elaboration	String	The reserved field. Default value: null.	4.1.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.1.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.1.0

#inventory

Name	Type	Description	Starting Version
name	String	The resource name.	4.1.0
uuid	String	The resource UUID.	4.1.0
type	String	The trigger type.	4.1.0

Name	Type	Description	Starting Version
ruleUuid	String	The auto-scaling rule UUID.	4.1.0
description	String	The detailed description of the resource.	4.1.0
state	String	The trigger state.	4.1.0
createDate	Timestamp	The creation time.	4.1.0
lastOpDate	Timestamp	The last update time.	4.1.0

SDK Sample

Java SDK

```
CreateAutoScalingRuleSchedulerJobTriggerAction action = new CreateAutoScalingRuleSchedulerJobTriggerAction();
action.schedulerJobUuid = "2f194775b8ab3e2b912f92a74501a7ea";
action.name = "createAlarmTrigger";
action.ruleUuid = "852f6e9199c439d0861eec939c5fbbe1";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateAutoScalingRuleSchedulerJobTriggerAction.Result res = action.call();
```

Python SDK

```
CreateAutoScalingRuleSchedulerJobTriggerAction action = CreateAutoScalingRuleSchedulerJobTriggerAction()
action.schedulerJobUuid = "2f194775b8ab3e2b912f92a74501a7ea"
action.name = "createAlarmTrigger"
action.ruleUuid = "852f6e9199c439d0861eec939c5fbbe1"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CreateAutoScalingRuleSchedulerJobTriggerAction.Result res = action.call()
```

5.1.8.15 DeleteAutoScalingRuleTrigger

API Request

URLs

```
DELETE zstack/v1/autoscaling/groups/rules/triggers/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X DELETE http://localhost:8080/zstack/v1/autoscaling/groups/rules/triggers/c81896a39caf320d988503625feb5a84
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.1.0
systemTags	List	body	Optional. The system tags.		3.1.0
userTags	List	body	Optional. The user tags.		3.1.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteAutoScalingRuleTriggerAction action = new DeleteAutoScalingRuleTriggerAction();
action.uuid = "c81896a39caf320d988503625feb5a84";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteAutoScalingRuleTriggerAction.Result res = action.call();
```

Python SDK

```
DeleteAutoScalingRuleTriggerAction action = DeleteAutoScalingRuleTriggerAction()
action.uuid = "c81896a39caf320d988503625feb5a84"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
DeleteAutoScalingRuleTriggerAction.Result res = action.call()
```

5.1.8.16 QueryAutoScalingRuleTrigger

API Request

URLs

```
GET zstack/v1/autoscaling/groups/rules/trigger
```

```
GET zstack/v1/autoscaling/groups/rules/trigger/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```

new vm"}}' http://localhost:8080/zstack/v1/autoscaling/vmtemplate

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vmInstance Name	String	body (contained in the params structure)	The VM instance name		3.1.0
vmInstance Description	String	body (contained in	Optional. The detailed description		3.1.0

Name	Type	Location	Description	Optional Value	Starting Version
		the params structure)	of the VM instance.		
vmInstanceOfferingUuid	String	body (contained in the params structure)	The instance offering of the VM instance.		3.1.0
imageUuid	String	body (contained in the params structure)	The image UUID of the VM instance.		3.1.0
l3NetworkUuids	List	body (contained in the params structure)	The L3 networks of the VM instance.		3.1.0
rootDiskOfferingUuid	String	body (contained in the params structure)	Optional. The disk offering of the VM instance root volume.		3.1.0
dataDiskOfferingUuids	List	body (contained in the params structure)	Optional. The disk offerings of the VM instance data volumes.		3.1.0
vmInstanceZoneUuid	String	body (contained in the params structure)	Optional. The zone to which the VM instance belongs.		3.1.0
vmInstanceClusterUuid	String	body (contained in the params structure)	Optional. The cluster to which the VM instance belongs.		3.1.0
hostUuid	String	body (contained in	Optional. The host UUID.		3.1.0

Name	Type	Location	Description	Optional Value	Starting Version
		the params structure)			
primaryStorageUuidForRootVolume	String	body (contained in the params structure)	Optional. The UUID of the primary storage where the root volume locates.		3.1.0
defaultL3NetworkUuid	String	body (contained in the params structure)	The default L3 network of the VM instance.		3.1.0
name	String	body (contained in the params structure)	The resource name.		3.1.0
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		3.1.0
type	String	body (contained in the params structure)	Optional. The template type.		3.1.0
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		3.1.0
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID list.		3.1.0
systemTags	List	body	Optional. The system tags.		3.1.0
userTags	List	body	Optional. The user tags.		3.1.0

**Note:**

- ZStack Cloud allows you to attach an affinity group to an auto-scaling group by using the `systemTags` parameter. You can set the value of the **systemTags** parameter to the **affinityGroupUuid** option.
 - The format of the option is `affinityGroupUuid::affinity group uuid`.
 - For example, `affinityGroupUuid::ade3ccc31fc63ac2937b2210c21c39b1`.

API Response

Sample Response

```

5.1.8.18 AttachAutoScalingTemplateToGroup

API Request

URLs

```
POST zstack/v1/autoscaling/template/{uuid}/groups/{groupUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```

{
  "params": {},
  "systemTags": [],
  "userTags": []
}

```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{}}' http://localhost:8080/zstack/
v1/autoscaling/template/a53e0f84df15313bba8560f6567da2d9/
groups/284172349b50324a9c2b8a09a28b3294
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The template UUID.		3.1.0
groupUuid	String	url	The UUID of the auto scaling group.		3.1.0
systemTags	List	body	Optional. The system tags.		3.1.0
userTags	List	body	Optional. The user tags.		3.1.0

API Response**Sample Response**

```
{
  "inventory": {
    "name": "test-group",
    "uuid": "32d1739bb918364a840d0ff0130eda61",
    "description": "just for test",
    "createDate": "Nov 14, 2017 10:20:57 PM",
    "lastOpDate": "Nov 14, 2017 10:20:57 PM",
    "attachedTemplates": [
      "e54e8d9e51113de2b6742ace7bfee306"
    ]
  }
}
```

}

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.1.0
inventory	AutoScalingGroupInventory	See inventory .	3.1.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.1.0
description	String	The brief description of the error.	3.1.0
details	String	The details about the error.	3.1.0
elaboration	String	The reserved field. Default value: null.	3.1.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.1.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.1.0

#inventory

Name	Type	Description	Starting Version
name	String	The resource name.	3.1.0

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.1.0
scalingResourceType	String	The type of the auto scaling resource: VM instance.	3.1.0
state	String	The state of the auto scaling group.	3.1.0
defaultCooldown	Long	The default cooldown time of the auto scaling rule.	3.1.0
description	String	The detailed description of the resource.	3.1.0
minResourceSize	Integer	The minimum number of VM instances in the auto scaling group.	3.1.0
maxResourceSize	Integer	The maximum number of VM instances in the auto scaling group.	3.1.0
removalPolicy	String	The default policy for removing a VM instance.	3.1.0
createDate	Timestamp	The creation date.	3.1.0
lastOpDate	Timestamp	The last operation date.	3.1.0
attachedTemplates	List	The templates of VM instances attached to the auto scaling group.	3.1.0
systemTags	List		3.1.0

SDK Sample

Java SDK

```
AttachAutoScalingTemplateToGroupAction action = new AttachAutoScalingTemplateToGroupAction();
action.uuid = "a53e0f84df15313bba8560f6567da2d9";
action.groupUuid = "284172349b50324a9c2b8a09a28b3294";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
AttachAutoScalingTemplateToGroupAction.Result res = action.call();
```

Python SDK

```
AttachAutoScalingTemplateToGroupAction action = AttachAutoScalingTemplateToGroupAction()
action.uuid = "a53e0f84df15313bba8560f6567da2d9"
action.groupUuid = "284172349b50324a9c2b8a09a28b3294"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
AttachAutoScalingTemplateToGroupAction.Result res = action.call()
```

5.1.8.19 DeleteAutoScalingTemplate

API Request

URLs

```
DELETE zstack/v1/autoscaling/template/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/autoscaling/
template/5c9e41a7d5c9335f99d639e75c294392
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.1.0
systemTags	List	body	Optional. The system tags.		3.1.0
userTags	List	body	Optional. The user tags.		3.1.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
```

```

    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}

```

SDK Sample

Java SDK

```

DeleteAutoScalingTemplateAction action = new DeleteAutoScalingTemplateAction();
action.uuid = "5c9e41a7d5c9335f99d639e75c294392";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteAutoScalingTemplateAction.Result res = action.call();

```

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.1.0
description	String	The brief description of the error.	3.1.0
details	String	The details about the error.	3.1.0
elaboration	String	The reserved field. Default value: null.	3.1.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.1.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.1.0

#inventories

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.1.0
instanceUuid	String	The VM instance UUID.	3.1.0
scalingGroupUuid	String	The UUID of the auto scaling group.	3.1.0

Name	Type	Description	Starting Version
templateUuid	String	The UUID of the VM instance template in the auto scaling group.	3.1.0
scalingGroupActivityUuid	String	The UUID of the auto scaling activity.	3.1.0
status	String	The status of the VM instance in the auto scaling group.	3.1.0
healthStatus	String	The health status of the VM instance in the auto scaling group.	3.1.0
description	String	The detailed description of the resource.	3.1.0
createDate	Timestamp	The creation date.	3.1.0
lastOpDate	Timestamp	The last operation date.	3.1.0
protectionStrategy	String	The instance protection strategy.	0.6

SDK Sample

Java SDK

```
QueryAutoScalingGroupInstanceAction action = new QueryAutoScalingGroupInstanceAction();
action.conditions = asList();
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryAutoScalingGroupInstanceAction.Result res = action.call();
```

Python SDK

```
QueryAutoScalingGroupInstanceAction action = QueryAutoScalingGroupInstanceAction()
action.conditions = []
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
QueryAutoScalingGroupInstanceAction.Result res = action.call()
```

5.1.8.24 ChangeAutoScalingGroupState

API Request

URLs

```
PUT zstack/v1/autoscaling/groups/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeAutoScalingGroupState": {
    "stateEvent": "disable"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"changeAutoScalingGroupState":{"stateEvent":"disable"}}'
http://localhost:8080/zstack/v1/autoscaling/
groups/384ac055e3113366907f06e8aaefb12d/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.1.0
stateEvent	String	body (contained in the changeAutoScalingGro	Whether to enable or disable the auto scaling group.	- enable - disable	3.1.0

Name	Type	Location	Description	Optional Value	Starting Version
		upState structure)			
systemTags	List	body	Optional. The system tags.		3.1.0
userTags	List	body	Optional. The user tags.		3.1.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
ChangeAutoScalingGroupStateAction action = new ChangeAutoScalingGro
upStateAction();
action.uuid = "384ac055e3113366907f06e8aaefb12d";
action.stateEvent = "disable";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
ChangeAutoScalingGroupStateAction.Result res = action.call();
```

Python SDK

```
ChangeAutoScalingGroupStateAction action = ChangeAutoScalingGro
upStateAction()
action.uuid = "384ac055e3113366907f06e8aaefb12d"
action.stateEvent = "disable"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
ChangeAutoScalingGroupStateAction.Result res = action.call()
```

5.1.8.25 ExecuteAutoScalingRule

API Request

URLs

```
PUT zstack/v1/autoscaling/rules/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "executeAutoScalingRule": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"executeAutoScalingRule":{}}'
http://localhost:8080/zstack/v1/autoscaling/
rules/9311aaae28333775b3339b644961c990/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The UUID of the auto scaling rule.		3.9.0
systemTags	List	body	Optional. The system tags.		3.9.0
userTags	List	body	Optional. The user tags.		3.9.0

API Response

Sample Response

```
{
  "scalingActivityUuid": "20ba90ed9e1631768fd7b896569fae62"
}
```

Name	Type	Description	Starting Version
scalingActivityUuid	String	The UUID of the auto scaling activity.	3.9.0
success	boolean		3.9.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.9.0
error	ErrorCode	See error .	3.9.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.9.0
description	String	The brief description of the error.	3.9.0
details	String	The details about the error.	3.9.0
elaboration	String	The reserved field. Default value: null.	3.9.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.9.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error	3.9.0

Name	Type	Description	Starting Version
		exists, this parameter is null.	

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	3.9.0
description	String	The brief description of the error.	3.9.0
details	String	The details about the error.	3.9.0
elaboration	String	The reserved field. Default value: null.	3.9.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.9.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.9.0

SDK Sample

Java SDK

```
ExecuteAutoScalingRuleAction action = new ExecuteAutoScalingRuleAction();
action.uuid = "9311aaae28333775b3339b644961c990";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
ExecuteAutoScalingRuleAction.Result res = action.call();
```

Python SDK

```
ExecuteAutoScalingRuleAction action = ExecuteAutoScalingRuleAction()
action.uuid = "9311aaae28333775b3339b644961c990"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
ExecuteAutoScalingRuleAction.Result res = action.call()
```

5.1.8.26 UpdateAutoScalingGroupInstance

API Request

URLs

```
PUT zstack/v1/autoscaling/groups/instances/{instanceUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateAutoScalingGroupInstance": {
    "groupUuid": "a3b7616d6e6a3ed6bdf5dd5a640a4548",
    "protectionStrategy": "Protected"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateAutoScalingGroupInstance":
{"groupUuid":"a3b7616d6e6a3ed6bdf5dd5a640a4548","protectionStrategy":"Protected"}'
http://localhost:8080/zstack/v1/autoscaling/groups/instances/
a6dcd12ee95e345787a34175327df816/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
groupUuid	String	body (contained in the updateAuto ScalingGro	The UUID of the auto scaling group.		3.9.0

Name	Type	Location	Description	Optional Value	Starting Version
		upInstance structure)			
instanceUuid	String	url	The UUID of the VM instance in the auto scaling group.		3.9.0
protectionStrategy	String	body (contained in the updateAutoScalingGroupInstance structure)	Optional. The VM protection strategy of the auto scaling group. - Protected - Unprotected		3.9.0
systemTags	List	body	Optional. The system tags.		3.9.0
userTags	List	body	Optional. The user tags.		3.9.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
UpdateAutoScalingGroupInstanceAction action = new UpdateAutoScalingGroupInstanceAction();
action.groupUuid = "a3b7616d6e6a3ed6bdf5dd5a640a4548";
action.instanceUuid = "a6dcd12ee95e345787a34175327df816";
action.protectionStrategy = "Protected";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
UpdateAutoScalingGroupInstanceAction.Result res = action.call();
```

Python SDK

```
UpdateAutoScalingGroupInstanceAction action = UpdateAutoScalingGro
upInstanceAction()
action.groupUuid = "a3b7616d6e6a3ed6bdf5dd5a640a4548"
action.instanceUuid = "a6dcd12ee95e345787a34175327df816"
action.protectionStrategy = "Protected"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateAutoScalingGroupInstanceAction.Result res = action.call()
```

5.1.8.27 UpdateAutoScalingVmTemplate

API Request

URLs

```
PUT zstack/v1/autoscaling/vmtemplate/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateAutoScalingVmTemplate": {
    "name": "template",
    "description": "for new vm",
    "vmInstanceName": "vm",
    "vmInstanceDescription": "vm desc",
    "vmInstanceOfferingUuid": "af0462e292513725aa228476d0f08ac3",
    "imageUuid": "9dc29a7b3e603a7cb26bc1d16eccc1f1"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateAutoScalingVmTemplate":
{"name":"template","description":"for new
vm","vmInstanceName":"vm","vmInstanceDescription":"vm
desc","vmInstanceOfferingUuid":"af0462e292513725aa228476d0f08ac3","imageUuid":"9
```

<http://localhost:8080/zstack/v1/autoscaling/vmtemplate/dfb4e8245e32361db57b92c95c84c01b/actions>

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The VM template UUID.		3.9.0
name	String	body (contained in the updateAutoScalingVmTemplate structure)	Optional. The template name.		3.9.0
description	String	body (contained in the updateAutoScalingVmTemplate structure)	Optional. The detailed description.		3.9.0
vmInstance Name	String	body (contained in the updateAutoScalingVmTemplate structure)	Optional. The name of the VM instance.		3.9.0
vmInstance Description	String	body (contained in the updateAutoScalingVmTemplate structure)	Optional. The description of the VM instance.		3.9.0
vmInstance OfferingUuid	String	body (contained in the updateAuto	Optional. The instance offering UUID		3.9.0

Name	Type	Location	Description	Optional Value	Starting Version
		ScalingVmTemplate structure)	of the VM instance.		
imageUuid	String	body (contained in the updateAutoScalingVmTemplate structure)	Optional. The UUID of the VM image.		3.9.0
systemTags	List	body	Optional. The system tags.		3.9.0
userTags	List	body	Optional. The user tags.		3.9.0

API Response

Sample Response

```
{
  "inventory": {
    "name": "template",
    "description": "desc",
    "state": "Enabled"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.9.0
inventory	AutoScalingTemplateInventory	See inventory .	3.9.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or	3.9.0

Name	Type	Description	Starting Version
		alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	
description	String	The brief description of the error.	3.9.0
details	String	The details about the error.	3.9.0
elaboration	String	The reserved field. Default value: null.	3.9.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.9.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.9.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.9.0
name	String	The resource name.	3.9.0
description	String	The detailed description of the resource.	3.9.0
type	String	The template type.	3.9.0
state	String	The state of the template.	3.9.0
systemTags	List		3.9.0
createDate	Timestamp	The creation date.	3.9.0
lastOpDate	Timestamp	The last operation date.	3.9.0

SDK Sample

Java SDK

```
UpdateAutoScalingVmTemplateAction action = new UpdateAutoScalingVmTemplateAction();
action.uuid = "dfb4e8245e32361db57b92c95c84c01b";
action.name = "template";
action.description = "for new vm";

```

5.1.9 Snapshot Group Operations

5.1.9.1 CreateVolumeSnapshotGroup

API Request

URLs

```
POST zstack/v1/volume-snapshots/group
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "rootVolumeUuid": "901cae4fd9f43a1ca20da4146ddaec50",
    "name": "test"
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"rootVolumeUuid": "901cae4fd9f43a1ca20da4146ddaec50", "name": "test"}}'
http://localhost:8080/zstack/v1/volume-snapshots/group
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
rootVolumeUuid	String	body (contained in the params structure)	The root volume UUID.		3.6.0
name	String	body (contained in the params structure)	The resource name.		3.6.0
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		3.6.0
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		3.6.0
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID list.		3.6.0
systemTags	List	body	Optional. The system tags.		3.6.0

Name	Type	Location	Description	Optional Value	Starting Version
userTags	List	body	Optional. The user tags.		3.6.0

API Response

Sample Response

code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.6.0
description	String	The brief description of the error.	3.6.0
details	String	The details about the error.	3.6.0
elaboration	String	The reserved field. Default value: null.	3.6.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.6.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.6.0

SDK Sample

Java SDK

```
DeleteVolumeSnapshotGroupAction action = new DeleteVolumeSnapshotGroupAction();
action.uuid = "f7b2175eebba3161b029689cb32f9b14";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteVolumeSnapshotGroupAction.Result res = action.call();
```

Python SDK

```
DeleteVolumeSnapshotGroupAction action = DeleteVolumeSnapshotGroupAction()
```

```

action.uuid = "f7b2175eebba3161b029689cb32f9b14"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteVolumeSnapshotGroupAction.Result res = action.call()

```

5.1.9.3 UpdateVolumeSnapshotGroup

API Request

URLs

```
PUT zstack/v1/volume-snapshots/group/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```

{
  "updateVolumeSnapshotGroup": {
    "name": "new name"
  },
  "systemTags": [],
  "userTags": []
}

```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateVolumeSnapshotGroup":{"name":"new name"}}'
http://localhost:8080/zstack/v1/volume-snapshots/group/
c39089cddb836628f346b14beafe2d3/actions

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the updateVolumeSnapshot	Optional. The resource name.		3.6.0

Name	Type	Location	Description	Optional Value	Starting Version
		Group structure)			
description	String	body (contained in the updateVolumeSnapshotGroup structure)	Optional. The detailed description of the resource.		3.6.0
uuid	String	url	The resource UUID.		3.6.0
systemTags	List	body	Optional. The system tags.		3.6.0
userTags	List	body	Optional. The user tags.		3.6.0

API Response

Sample Response

```
{
  "inventory": {

        "lastOpDate": "Nov 14, 2017 10:20:57 PM"
      }
    ]
  }
}
```

}

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.6.0
inventory	VolumeSnapshotGroupInventory	See inventory .	3.6.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.6.0
description	String	The brief description of the error.	3.6.0
details	String	The details about the error.	3.6.0
elaboration	String	The reserved field. Default value: null.	3.6.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.6.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.6.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.6.0

Name	Type	Description	Starting Version
snapshotCount	Integer	The number of snapshots in the snapshot group.	3.6.0
name	String	The resource name.	3.6.0
description	String	The detailed description of the resource.	3.6.0
vmInstanceUuid	String	The VM instance UUID.	3.6.0
createDate	Timestamp	The creation date.	3.6.0
lastOpDate	Timestamp	The last operation date.	3.6.0
volumeSnapshotRefs	List	See volumeSnapshotRefs .	3.6.0

#volumeSnapshotRefs

Name	Type	Description	Starting Version
volumeSnapshotUuid	String	The volume snapshot UUID.	3.6.0
volumeSnapshotGroupUuid	String	The snapshot group UUID.	3.6.0
deviceId	int	The device ID of the volume when the snapshot is taken.	3.6.0
snapshotDeleted	boolean	Whether the snapshot is deleted.	3.6.0
volumeUuid	String	The volume UUID.	3.6.0
volumeName	String	The volume name.	3.6.0
volumeType	String	The volume type.	3.6.0
volumeSnapshotInstallPath	String	The path to install the snapshot.	3.6.0
volumeSnapshotName	String	The snapshot name.	3.6.0
createDate	Timestamp	The creation date.	3.6.0

Name	Type	Description	Starting Version
lastOpDate	Timestamp	The last operation date.	3.6.0

SDK Sample

Java SDK

```
UpdateVolumeSnapshotGroupAction action = new UpdateVolumeSnapshotGroupAction();
action.name = "new name";
action.uuid = "c39089cddb836628f346b14beafe2d3";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateVolumeSnapshotGroupAction.Result res = action.call();
```

Python SDK

```
UpdateVolumeSnapshotGroupAction action = UpdateVolumeSnapshotGroupAction()
action.name = "new name"
action.uuid = "c39089cddb836628f346b14beafe2d3"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateVolumeSnapshotGroupAction.Result res = action.call()
```

5.1.9.4 QueryVolumeSnapshotGroup

API Request

URLs

```
GET zstack/v1/volume-snapshots/group
```

```
GET zstack/v1/volume-snapshots/group/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/volume-snapshots/group?
q=uuid=9480c1736b9c3798b3030cd990f0db8f
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/volume-snapshots/
group/91c3de9ffbc73475a84b8038c8a2349c
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryVolumeSnapshotGroup**, and pressing the **Tab** key.

API Response

Sample Response

```
{
  "inventories": [
    {

SDK Sample

Java SDK

```
QueryVolumeSnapshotGroupAction action = new QueryVolumeSnapshotGroupAction();
action.conditions = asList("uuid=102cde8f217430aaaf5652460adb7d7e");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryVolumeSnapshotGroupAction.Result res = action.call();
```

Python SDK

```
QueryVolumeSnapshotGroupAction action = QueryVolumeSnapshotGroupAction()
action.conditions = ["uuid=3ad89f9fbe823083b1918f872381a1f5"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
QueryVolumeSnapshotGroupAction.Result res = action.call()
```

5.1.9.5 CheckVolumeSnapshotGroupAvailability

API Request

URLs

```
GET zstack/v1/volume-snapshots/groups/availabilities
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/volume-snapshots/groups/
availabilities?uuids=cc389f9eb3223c698f565621d2abcf72
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuids	List	query	The snapshot group UUIDs.		3.6.0
systemTags	List	query	Optional. The system tags.		3.6.0
userTags	List	query	Optional. The user tags.		3.6.0

API Response

Sample Response

```
{
  "results": [
    {
      "uuid": "78dd38e3e58134cead860f270143a474",
      "available": true,
      "reason": ""
    }
  ]
}
```

}

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.6.0
results	List	See results .	3.6.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.6.0
description	String	The brief description of the error.	3.6.0
details	String	The details about the error.	3.6.0
elaboration	String	The reserved field. Default value: null.	3.6.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.6.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.6.0

#results

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.6.0

Name	Type	Description	Starting Version
available	boolean	Whether the volume snapshot group is available.	3.6.0
reason	String	The reason why the volume snapshot group is unavailable. If the volume snapshot group is available, this parameter is null.	3.6.0

SDK Sample

Java SDK

```
CheckVolumeSnapshotGroupAvailabilityAction action = new CheckVolumeSnapshotGroupAvailabilityAction();
action.uuids = asList("cc389f9eb3223c698f565621d2abcf72");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CheckVolumeSnapshotGroupAvailabilityAction.Result res = action.call();
```

Python SDK

```
CheckVolumeSnapshotGroupAvailabilityAction action = CheckVolumeSnapshotGroupAvailabilityAction()
action.uuids = [cc389f9eb3223c698f565621d2abcf72]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CheckVolumeSnapshotGroupAvailabilityAction.Result res = action.call()
```

5.1.9.6 RevertVmFromSnapshotGroup

API Request

URLs

```
PUT zstack/v1/volume-snapshots/group/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "revertVmFromSnapshotGroup": {},
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"revertVmFromSnapshotGroup":{}}'
http://localhost:8080/zstack/v1/volume-snapshots/
group/37050441a903313297e65e09ccbeb30f/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The snapshot group UUID.		3.6.0
systemTags	List	body	Optional. The system tags.		3.6.0
userTags	List	body	Optional. The user tags.		3.6.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample**Java SDK**

```
RevertVmFromSnapshotGroupAction action = new RevertVmFromSnapshot
GroupAction();
action.uuid = "37050441a903313297e65e09ccbeb30f";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
RevertVmFromSnapshotGroupAction.Result res = action.call();
```

Python SDK

```
RevertVmFromSnapshotGroupAction action = RevertVmFromSnapshotGroupAction()
action.uuid = "37050441a903313297e65e09ccbeb30f"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
RevertVmFromSnapshotGroupAction.Result res = action.call()
```

5.1.9.7 UndoSnapshotCreation

API Request

URLs

```
PUT zstack/v1/volumes/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "undoSnapshotCreation": {
    "snapShotUuid": "7677380457d136629f44c93c99978acc"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"undoSnapshotCreation":
{"snapShotUuid":"7677380457d136629f44c93c99978acc"}}' http://
localhost:8080/zstack/v1/volumes/7fc32ad187c939d8aca65977560c2714/
actions
```

Request Parameters

Name	Type	Location	Description	Valid Values	Starting Version
uuid	String	url	The resource UUID.		4.8.0
snapshotUuid	String	body (contained in the undoSnapshotCreation structure)			4.8.0
systemTags	List	body	Optional. The system tags.		4.8.0
userTags	List	body	Optional. The user tags.		4.8.0

API Response

Sample Response

```

```
UndoSnapshotCreationAction.Result res = action.call()
```

5.1.9.8 UngroupVolumeSnapshotGroup

API Request

URLs

```
DELETE zstack/v1/volume-snapshots/ungroup/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/volume-snapshots/
ungroup/8903cef5a11c3457881bfd7bd5f04757
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The snapshot group UUID.		3.6.0
systemTags	List	body	Optional. The system tags.		3.6.0
userTags	List	body	Optional. The user tags.		3.6.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
UngroupVolumeSnapshotGroupAction action = new UngroupVolumeSnapsho
tGroupAction();
action.uuid = "8903cef5a11c3457881bfd7bd5f04757";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";

```

Python SDK

```
UngroupVolumeSnapshotGroupAction action = UngroupVolumeSnapsho
tGroupAction()
action.uuid = "8903cef5a11c3457881bfd7bd5f04757"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UngroupVolumeSnapshotGroupAction.Result res = action.call()
```

5.1.9.9 GetMemorySnapshotGroupReference

API Requests

URLs

```
GET zstack/v1/memory-snapshots/group/reference
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Samples

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/memory-snapshots/group/
reference?
resourceUuid=293e9dd057c831608cf59cd377ba0d03&resourceType=L3NetworkVO
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
resourceUuid	String	query	The resource UUID.		4.4.24
resourceType	String	query	The resource type.		4.4.24

Name	Type	Location	Description	Valid Value	Starting Version
systemTags	List	query	Optional. The system tags.		4.4.24
userTags	List	query	Optional. The user tags.		4.4.24

API Response

```

```
GetMemorySnapshotGroupReferenceAction action = GetMemorySnapshotGroupReferenceAction()
action.resourceUuid = "293e9dd057c831608cf59cd377ba0d03"
```

```
action.resourceType = "L3NetworkV0"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetMemorySnapshotGroupReferenceAction.Result res = action.call()
```

5.1.10 SSH Key Operations

5.1.10.1 GenerateSshKeyPair

API Request

URLs

```
POST zstack/v1/ssh-key-pair/generate
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "ssh-key-pair",
    "description": "description"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8"
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c"
-X POST -d '{"params":{"name":"ssh-key-pair","description":"description"}}'
http://localhost:8080/zstack/v1/ssh-key-pair/generate
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The resource name.		4.7.21

Name	Type	Location	Description	Optional Value	Starting Version
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		4.7.21
systemTags	List	body	Optional. The system tags.		4.7.21
userTags	List	body	Optional. The user tags.		4.7.21

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "25d8c1517825305f9dbcf5413197faf",
    "name": "ssh-key-pair",
    "publicKey": "ssh-public-key",
    "privateKey": "ssh-private-key"
  }
}
```

Name	Type	Description	Starting Version
success	boolean		4.7.21
inventory	SshPrivateKeyPairInventory	See inventory .	4.7.21
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.7.21

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error	4.7.21

Name	Type	Description	Starting Version
		. For example, SYS.1000, HOST.1001.	
description	String	The brief description of the error.	4.7.21
details	String	The details about the error.	4.7.21
elaboration	String	The reserved field. Default value: null.	4.7.21
opaque	LinkedHashMap	The reserved field. Default value: null.	4.7.21
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.7.21

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	4.7.21
name	String	The resource name.	4.7.21
description	String	The detailed description of the resource.	4.7.21
publicKey	String		4.7.21
createDate	Timestamp	The creation date.	4.7.21
lastOpDate	Timestamp	The last operation date.	4.7.21
privateKey	String		4.7.21

SDK Sample

Java SDK

```
GenerateSshKeyPairAction action = new GenerateSshKeyPairAction();
action.name = "ssh-key-pair";
action.description = "description";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
GenerateSshKeyPairAction.Result res = action.call();
```

Python SDK

```

publicKey	String		4.7.21
createDate	Timestamp	The creation date.	4.7.21
lastOpDate	Timestamp	The last operation date.	4.7.21

SDK Sample

Java SDK

```
CreateSshKeyPairAction action = new CreateSshKeyPairAction();
action.name = "ssh-key-pair";
action.description = "description";
action.publicKey = "";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateSshKeyPairAction.Result res = action.call();
```

Python SDK

```
CreateSshKeyPairAction action = CreateSshKeyPairAction()
action.name = "ssh-key-pair"
action.description = "description"
action.publicKey = ""
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CreateSshKeyPairAction.Result res = action.call()
```

5.1.10.3 DeleteSshKeyPair

API Request

URLs

```
DELETE zstack/v1/ssh-key-pair/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8"
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c"
-X DELETE http://localhost:8080/zstack/v1/ssh-key-pair/67560ca0fb1d35b7bd520d43e2cbacee?
```

```
http://localhost:8080/zstack/v1/ssh-key-pair/67560ca0fb1d35b7bd520d43e2cbacee?
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		4.7.21
systemTags	List	body	Optional. The system tags.		4.7.21
userTags	List	body	Optional. The user tags.		4.7.21

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteSshKeyPairAction action = new DeleteSshKeyPairAction();
action.uuid = "67560ca0fb1d35b7bd520d43e2cbacee";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteSshKeyPairAction.Result res = action.call();
```

Python SDK

```
DeleteSshKeyPairAction action = DeleteSshKeyPairAction()
action.uuid = "67560ca0fb1d35b7bd520d43e2cbacee"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
DeleteSshKeyPairAction.Result res = action.call()
```

5.1.10.4 QuerySshKeyPair

API Request

URLs

```
GET zstack/v1/ssh-key-pair
GET zstack/v1/ssh-key-pair/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8"
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c"
-X GET http://localhost:8080/zstack/v1/ssh-key-pair?
q=uuid=1d1c2b759ab23353946035b266bd2ac1
```

```
curl -H "Content-Type: application/json;charset=UTF-8"
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c"
-X GET http://localhost:8080/zstack/v1/ssh-key-
pair/085e223844b03474a590f5877b53e0c8
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QuerySshKeyPair**, and pressing the **Tab** key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "uuid": "f289105c96f230e9a8add069c3a1bd69",
      "name": "ssh-key-pair",
      "publicKey": ""
    }
  ]
}
```

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.7.21
description	String	The brief description of the error.	4.7.21
details	String	The details about the error.	4.7.21
elaboration	String	The reserved field. Default value: null.	4.7.21
opaque	LinkedHashMap	The reserved field. Default value: null.	4.7.21
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.7.21

#inventory

名字	类型	描述	起始版本
uuid	String	The resource UUID.	4.7.21
name	String	The resource name.	4.7.21
description	String	The detailed description of the resource.	4.7.21

名字	类型	描述	起始版本
publicKey	String		4.7.21
createDate	Timestamp	The creation date.	4.7.21
lastOpDate	Timestamp	The last operation date.	4.7.21

SDK Sample

Java SDK

```
AttachSshKeyPairToVmInstanceAction action = new AttachSshKeyPairToVmInstanceAction();
action.vmInstanceId = "e76f9792afac3bca8aec7a5d4e768197";
action.sshKeyPairUuid = "9d4fe97b6e0a3d65bca85b093e74d6c9";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
AttachSshKeyPairToVmInstanceAction.Result res = action.call();
```

Python SDK

```
AttachSshKeyPairToVmInstanceAction action = AttachSshKeyPairToVmInstanceAction()
action.vmInstanceId = "e76f9792afac3bca8aec7a5d4e768197"
action.sshKeyPairUuid = "9d4fe97b6e0a3d65bca85b093e74d6c9"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
AttachSshKeyPairToVmInstanceAction.Result res = action.call()
```

5.1.10.7 DetachSshKeyPairFromVmInstance

API Request

URLs

```
DELETE zstack/v1/ssh-key-pair/{sshKeyPairUuid}/vm-instance/{vmInstanceId}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8"
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c"
-X DELETE
http://localhost:8080/zstack/v1/ssh-key-
pair/9be9cb6b56b13746a99660a0d07a0770/vm-instance/
dd734d0cd5c53bcc48cec9d2b4aa6d6?
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vmInstance Uuid	String	url	The VM instance UUID		4.7.21
sshKeyPair Uuid	String	url			4.7.21
systemTags	List	body	Optional. The system tags.		4.7.21
userTags	List	body	Optional. The user tags.		4.7.21

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DetachSshKeyPairFromVmInstanceAction action = new DetachSshKeyPairFromVmInstanceAction();
action.vmInstanceUuid = "dd734d0cd5c53bcc48cec9d2b4aa6d6";
action.sshKeyPairUuid = "9be9cb6b56b13746a99660a0d07a0770";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
DetachSshKeyPairFromVmInstanceAction.Result res = action.call();
```

Python SDK

```
DetachSshKeyPairFromVmInstanceAction action = DetachSshKeyPairFromVmInstanceAction()
action.vmInstanceId = "dd734d0cd5c53bcca48cec9d2b4aa6d6"
action.sshKeyPairUuid = "9be9cb6b56b13746a99660a0d07a0770"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DetachSshKeyPairFromVmInstanceAction.Result res = action.call()
```

5.2 Hardware

5.2.1 Zone Operations

5.2.1.1 CreateZone

API Request

URLs

```
POST zstack/v1/zones
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "TestZone",
    "description": "test zone"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"name":"TestZone","description":"test zone"}}' \
http://localhost:8080/zstack/v1/zones
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The resource name.		0.6
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		0.6
resourceUuid	String	body (contained in the params structure)	Optional. The specified resource UUID.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "0d26522305c34d07b5661ccda62053c0",
    "name": "TestZone",
    "description": "Test",
    "state": "Enabled",
    "type": "zstack",
    "createDate": "Jun 7, 2017 9:20:28 PM",
    "lastOpDate": "Jun 7, 2017 9:20:28 PM"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventory	ZoneInventory	See inventory .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The short description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
name	String	The resource name.	0.6
description	String	The detailed description of the resource.	0.6
state	String		0.6
type	String		0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6

SDK Sample

Java SDK

```
CreateZoneAction action = new CreateZoneAction();
action.name = "TestZone";
action.description = "test zone";
action.sessionId = "982a09118de64ef7a9051fde346270c5";
CreateZoneAction.Result res = action.call();
```

Python SDK

```
CreateZoneAction action = CreateZoneAction()
action.name = "TestZone"
action.description = "test zone"
action.sessionId = "79e260dca17b4bdf9b7d7b4e150883df"
CreateZoneAction.Result res = action.call()
```

5.2.1.2 DeleteZone

API Request

URLs

```
DELETE zstack/v1/zones/{uuid}?deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 05fc0a34be264877a9dc8dfb5f90d619" \
-X DELETE http://localhost:8080/zstack/v1/zones/
d3483ca440334af3acc09d8631e814c6?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
deleteMode	String	body	Optional. The delete mode. Options: Permissive Enforcing.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
			Default mode: Permissive. • Permissive: If an error occurs, or if the delete operation is refused, ZStack Cloud will stop the delete operation. In this mode, an error code that contains the failure reason will be returned. • Enforcing: ZStack Cloud will ignore all errors and permissions to delete directly the resource. In this mode, the delete operation will always succeed.		
systemTags	List	body	Optional. The system tags.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteZoneAction action = new DeleteZoneAction();
action.uuid = "8987020fccd14191a5a89dda6f3db81e";
action.deleteMode = "Permissive";
action.sessionId = "835b1b72c4554a7e92c425ad9eaebc6d";
DeleteZoneAction.Result res = action.call();
```

Python SDK

```
DeleteZoneAction action = DeleteZoneAction()
action.uuid = "a4bcb439c99a42e197cac90be83e706e"
action.deleteMode = "Permissive"
action.sessionId = "6eaf02e52c884e378a3730ce4267d83a"
DeleteZoneAction.Result res = action.call()
```

5.2.1.3 QueryZone

API Request

URLs

```
GET zstack/v1/zones
```

```
GET zstack/v1/zones/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth e556a104ae874303897ac67d83564086" \
-X GET http://localhost:8080/zstack/v1/zones?
q=name=TestZone&q=state=Enabled
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 7e9fd15bba0d43a2b1a7212c85fb8787" \
-X GET http://localhost:8080/zstack/v1/
zones/9276d05c7d7545d6b61bfc50f017b86c
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryZone`, and pressing the **Tab** key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "uuid": "a58fb4240ed04129a0896b565f24a9df",
      "name": "TestZone",
      "description": "Test",
      "state": "Enabled",
      "type": "zstack",
      "createDate": "Jun 7, 2017 9:20:29 PM",
      "lastOpDate": "Jun 7, 2017 9:20:29 PM"
    }
  ]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6

SDK Sample

Java SDK

```
QueryZoneAction action = new QueryZoneAction();
action.conditions = asList("name=TestZone","state=Enabled");
action.sessionId = "608079b963b54e8a9aa3a2291adae89f";
QueryZoneAction.Result res = action.call();
```

Python SDK

```
QueryZoneAction action = QueryZoneAction()
action.conditions = ["name=TestZone","state=Enabled"]
action.sessionId = "be89929b7fd34d25a5c1a7f47f4490cd"
QueryZoneAction.Result res = action.call()
```

5.2.1.4 UpdateZone

API Request

URLs

```
PUT zstack/v1/zones/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateZone": {
    "name": "TestZone2",
    "description": "test second zone"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateZone":{"name":"TestZone2","description":"test second zone"}}' \
```

```
http://localhost:8080/zstack/v1/
zones/3fc9a2d76b043ead90c537561edcb50e/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the updateZone structure)	Optional. The resource name.		0.6
description	String	body (contained in the updateZone structure)	Optional. The detailed description of the resource.		0.6
uuid	String	url	The resource UUID.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "eb5d94d030e84fb286c4f281520b163b",

SDK Sample

Java SDK

```
CreateClusterAction action = new CreateClusterAction();
action.zoneUuid = "70fd596da027478eb22ac9357aed23f4";
action.name = "cluster1";
action.description = "test";
action.hypervisorType = "KVM";
action.sessionId = "894477861bcc45488978b584908e4ee3";
CreateClusterAction.Result res = action.call();
```

Python SDK

```
CreateClusterAction action = CreateClusterAction()
action.zoneUuid = "cfe698802c87486986878daa2da7e02f"
action.name = "cluster1"
action.description = "test"
action.hypervisorType = "KVM"
action.sessionId = "0664130c5d36414bbb3a7a59ef87ea5a"
```

```
CreateClusterAction.Result res = action.call()
```

5.2.2.2 DeleteCluster

API Request

URLs

```
DELETE zstack/v1/clusters/{uuid}?deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth d55b1a48ad2348ceb3bea95b407a8bde" \
-X DELETE http://localhost:8080/zstack/v1/clusters/
a5bb7e5ca83f41748538d953709ba3c3?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
deleteMode	String	body	Optional. The delete mode.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DeleteClusterAction action = new DeleteClusterAction();
action.uuid = "51b6e91ce692487ea582418f52835061";
action.deleteMode = "Permissive";
action.sessionId = "41695ae924854a3abfc1e681e092f744";
DeleteClusterAction.Result res = action.call();
```

Python SDK

```
DeleteClusterAction action = DeleteClusterAction()
action.uuid = "2e9d94bbe3d240d3a660e86a7cd6aff8"
action.deleteMode = "Permissive"
action.sessionId = "386fba061d404eeb830a772e31fd4faf"
DeleteClusterAction.Result res = action.call()
```

5.2.2.3 QueryCluster

API Request

URLs

```
GET zstack/v1/clusters
GET zstack/v1/clusters/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 815c808ecfb5461b953544d4bcefea31" \
-X GET http://localhost:8080/zstack/v1/clusters?q=hypervisorType=KVM
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 663eef55906d4b6e9750f9b4ed65f5f9" \
-X GET http://localhost:8080/zstack/v1/clusters/
a8d5ea1ceda34616a26bec2fce3b4d8a
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryCluster`, and pressing the **Tab** key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "name": "cluster1",
      "uuid": "41f3a4eb130347a2af6d7f2e0d21fab0",
      "description": "test",
      "state": "Enabled",
      "hypervisorType": "KVM",
      "createDate": "Jun 7, 2017 9:20:13 PM",
      "lastOpDate": "Jun 7, 2017 9:20:13 PM",
      "zoneUuid": "aad01c8b25774796b2e341ec51a7c9c1",
      "type": "zstack"
    }
  ]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventories	List	See inventories .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6

Name	Type	Description	Starting Version
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventories

Name	Type	Description	Starting Version
name	String	The resource name.	0.6
uuid	String	The resource UUID.	0.6
description	String	The detailed description of the resource.	0.6
state	String	The cluster state.	0.6
hypervisorType	String	The hypervisor type.	0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6
zoneUuid	String	The zone UUID.	0.6
type	String	The reserved field.	0.6

SDK Sample

Java SDK

```
QueryClusterAction action = new QueryClusterAction();
action.conditions = asList("hypervisorType=KVM");
action.sessionId = "3e214b652cc947ea9e1aa256d05752ea";
QueryClusterAction.Result res = action.call();
```

Python SDK

```
QueryClusterAction action = QueryClusterAction()
action.conditions = ["hypervisorType=KVM"]
action.sessionId = "ad8f3cd4b5bc4da0a3a91dc8bcbdd18c"
```

```
QueryClusterAction.Result res = action.call()
```

5.2.2.4 UpdateCluster

API Request

URLs

```
PUT zstack/v1/clusters/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateCluster": {
    "name": "cluster1",
    "description": "test"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateCluster":{"name":"cluster1","description":"test"}}' \
http://localhost:8080/zstack/v1/
clusters/851a3783e1503de2a1b9222014c843c4/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
name	String	body (contained in the	Optional. The resource name.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
		updateCluster structure)			
description	String	body (contained in the updateCluster structure)	Optional. The detailed description of the resource.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {
    "name": "cluster1",
    "uuid": "9dd0fbecb0e04260ad161c66d1da9f96",
    "description": "test",
    "state": "Enabled",
    "hypervisorType": "KVM",
    "createDate": "Jun 7, 2017 9:20:29 PM",
    "lastOpDate": "Jun 7, 2017 9:20:29 PM",
    "zoneUuid": "25b7ddce968f4cbbb58aa5a205e116ee",
    "type": "zstack"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventory	ClusterInventory	See inventory .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventory

Name	Type	Description	Starting Version
name	String	The resource name.	0.6
uuid	String	The resource UUID.	0.6
description	String	The detailed description of the resource.	0.6
state	String	The cluster state.	0.6
hypervisorType	String	The hypervisor type.	0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6
zoneUuid	String	The zone UUID.	0.6
type	String	The reserved field.	0.6

SDK Sample

Java SDK

```
UpdateClusterAction action = new UpdateClusterAction();
action.uuid = "ce185b26a4f14153941a868435d94498";
action.name = "cluster1";
action.description = "test";
action.sessionId = "5abfadbc97d64b4687ba6281de117d2d";
UpdateClusterAction.Result res = action.call();
```

Python SDK

```
UpdateClusterAction action = UpdateClusterAction()
action.uuid = "a643ba1b98524c60acced530ce2ded1b"
action.name = "cluster1"
action.description = "test"
action.sessionId = "cc779e5d5344493d9bd1cb1ced887321"
UpdateClusterAction.Result res = action.call()
```

5.2.2.5 ChangeClusterState

API Request

URLs

```
PUT zstack/v1/clusters/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeClusterState": {
    "stateEvent": "disable"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"changeClusterState":{"stateEvent":"disable"}}' \
```

```
http://localhost:8080/zstack/v1/
clusters/652ee5e996203bfb5eb75e750720093/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
stateEvent	String	body (contained in the changeClusterState structure)	The state event.	• enable • disable	0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {
    "name": "cluster1",
    "uuid": "2cebd4274c7c4550add1ee3620b52a81",
    "description": "test",
    "state": "Enabled",
    "hypervisorType": "KVM",
    "createDate": "Jun 7, 2017 9:20:25 PM",
    "lastOpDate": "Jun 7, 2017 9:20:25 PM",
    "zoneUuid": "90eb72b73e144650990db2aa1dde7c1",
    "type": "zstack"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventory	ClusterInventory	See inventory .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventory

Name	Type	Description	Starting Version
name	String	The resource name.	0.6

lastOpDate	Timestamp	The last operation date.	0.6
zoneUuid	String	The zone UUID.	0.6

Name	Type	Description	Starting Version
type	String	The reserved field.	0.6

SDK Sample

Java SDK

```
ChangeClusterStateAction action = new ChangeClusterStateAction();
action.uuid = "b97eb5ab5e264edbad128090b0ac28c2";
action.stateEvent = "disable";
action.sessionId = "79368b716c6a4d5db37fc7c601bf14cc";
ChangeClusterStateAction.Result res = action.call();
```

Python SDK

```
ChangeClusterStateAction action = ChangeClusterStateAction()
action.uuid = "24f520e8991d464eaf2ed9b1e55996a3"
action.stateEvent = "disable"
action.sessionId = "11db5049d24342e7af8b1a3992484184"
ChangeClusterStateAction.Result res = action.call()
```

5.2.2.6 UpdateClusterOS

API Request

URLs

```
PUT zstack/v1/clusters/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateClusterOS": {
    "excludePackages": [
      "kernel",
      "systemd*"
    ],
    "updatePackages": [
      "zstack-release"
    ],
    "releaseVersion": "c74",
    "force": false
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateClusterOS":{"excludePackages":
["kernel","systemd*"],"updatePackages":["zstack-
release"],"releaseVersion":"c74","force":false}}' http://
localhost:8080/zstack/v1/clusters/31c4951f39ae38969802e833448369ae/
actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.3
excludePackages	List	body (contained in the updateClusterOS structure)	Optional. The packages not to be upgraded.		3.7.0
updatePackages	List	body (contained in the updateClusterOS structure)	Optional. The packages to be upgraded.		3.7.0
releaseVersion	String	body (contained in the updateClusterOS structure)	Optional. The release version of the operating system.		3.7.0
resourceUuid	String	body (contained in the	Optional. The resource UUID.		3.7.0

Name	Type	Location	Description	Optional Value	Starting Version
		updateClusterOS structure)			
tagUuids	List	body (contained in the updateClusterOS structure)	Optional. The tag UUID list.		3.7.0
systemTags	List	body	Optional. The system tags.		2.3
userTags	List	body	Optional. The user tags.		2.3
force	boolean	body (contained in the updateClusterOS structure)	Optional. Whether update cluster OS forcefully or not.		5.2.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "932696598b64375ea4ae6226cc0c1407"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.3
inventory	LongJobInventory	See inventory .	2.2

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	0.6
description	String	The detailed description of the error.	0.6

action.force = false
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
UpdateClusterOSAction.Result res = action.call()
```

5.2.3 Host Operations

5.2.3.1 CreateBonding

API Request

URLs

```
POST zstack/v1/hosts/bondings
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "hostUuids": [
      "83e1a4a2ca0d3b0e836b032118196455"
    ],
    "type": "LinuxBonding",
    "mode": "802.3ad",
    "xmitHashPolicy": "layer2+3"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"hostUuids":

interfaceName	String	The interface name.	4.7.0
interfaceType	String	The interface type. Options: nomaster, bridgeSlave, and bondSlave.	4.7.0
speed	Long	The interface speed.	4.7.0
slaveActive	Boolean	The bond link status.	4.7.0
carrierActive	Boolean	The physical link status.	4.7.0
ipAddresses	List	The IP address.	4.7.0
gateway	String	The gateway address.	4.7.0
mac	String	The MAC address.	4.7.0
callBackIp	String	The callback IP address.	4.7.0
pciDeviceAddress	String	The PCI address of the interface.	4.7.0
offloadStatus	String		4.7.0
description	String	The resource description.	4.7.0
createDate	Timestamp	The creation time.	4.7.0
lastOpDate	Timestamp	The last operation time.	4.7.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	4.7.0
description	String	The brief description of the error.	4.7.0
details	String	The details about the error.	4.7.0
elaboration	String	The reserved field. Default value: null.	4.7.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.7.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.7.0

SDK Sample

Java SDK

```
CreateBondingAction action = new CreateBondingAction();
action.hostUuids = asList("83e1a4a2ca0d3b0e836b032118196455");
action.type = "LinuxBonding";
action.mode = "802.3ad";
action.xmitHashPolicy = "layer2+3";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateBondingAction.Result res = action.call();
```

Python SDK

```
CreateBondingAction action = CreateBondingAction()
action.hostUuids = ["83e1a4a2ca0d3b0e836b032118196455"]
action.type = "LinuxBonding"
action.mode = "802.3ad"
action.xmitHashPolicy = "layer2+3"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
CreateBondingAction.Result res = action.call()
```

5.2.3.2 DeleteBonding

API Request

URLs

```
DELETE zstack/v1/hosts/bondings/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/hosts/
bondings/6176f82c38f336d0a9ade9a84e1931a1
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		4.7.0
deleteMode	String	body	Optional. The deleting mode (Permissive /Enforcing, Permissive).		4.7.0
systemTags	List	body	Optional. The system tags.		4.7.0
userTags	List	body	Optional. The user tags.		4.7.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
}
```

SDK Sample

Java SDK

```
DeleteBondingAction action = new DeleteBondingAction();
action.uuid = "6176f82c38f336d0a9ade9a84e1931a1";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteBondingAction.Result res = action.call();
```

Python SDK

```
DeleteBondingAction action = DeleteBondingAction()
action.uuid = "6176f82c38f336d0a9ade9a84e1931a1"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteBondingAction.Result res = action.call()
```

5.2.3.3 QueryHost

API Request

URLs

```
GET zstack/v1/hosts
GET zstack/v1/hosts/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 99a86d711f154752b52a7de2b3c43a63" \
-X GET http://localhost:8080/zstack/v1/hosts?
q=uuid=66547f0fc9fd45d98f6b8482488f2993
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth bd46777b8a8c4616a64f0cdbcf1bf98e" \
-X GET http://localhost:8080/zstack/v1/hosts/
bb582f21cfad4f61a2ab1ec062131b4a
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryHost`, and pressing the **Tab** key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "zoneUuid": "37649b12f572303a883c19c4c7af0856",
      "name": "example",
      "uuid": "f7bae73b9874344b8766dfcdda48ad6e",
      "clusterUuid": "d59c027b81fe3bbc9d78ef45f574febb",
      "description": "example",
      "managementIp": "192.168.0.1",
      "hypervisorType": "KVM",
      "state": "Enabled",
      "status": "Connected",
      "totalCpuCapacity": 4.0,
      "availableCpuCapacity": 2.0,
      "cpuSockets": 4.0,
      "totalMemoryCapacity": 1840414720,
      "availableMemoryCapacity": 1840414720,
      "cpuNum": 4.0
    }
  ]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventories	List	See inventories .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6

Name	Type	Description	Starting Version
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventories

Name	Type	Description	Starting Version
zoneUuid	String	The zone UUID.	0.6
name	String	The resource name.	0.6
uuid	String	The resource UUID.	0.6
clusterUuid	String	The cluster UUID.	0.6
description	String	The detailed description of the resource.	0.6
managementIp	String		0.6
hypervisorType	String		0.6
state	String	The host state, including: • Enabled • Disabled • PreMaintenance • Maintenance	0.6
status	String	The host status, including: • Connecting • Connected • Disconnected	0.6
totalCpuCapacity	Long		0.6

Name	Type	Description	Starting Version
availableCpuCapacity	Long		0.6
cpuSockets	Integer		0.6
totalMemoryCapacity	Long		0.6
availableMemoryCapacity	Long		0.6
cpuNum	Integer		0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6

**Note:**

The state of a host can be changed as follows:

- A host in the Enabled state can be changed to the Disabled or PreMaintenance state.
- A host in the Disabled state can be changed to the Enabled or PreMaintenance state.
- A host in the PreMaintenance state can be changed to the Disabled, Enabled, or Maintenance state.
- A host in the Maintenance state can be changed to the Disabled or Enabled state.

SDK Sample

Java SDK

```
QueryHostAction action = new QueryHostAction();
action.conditions = asList("uuid=fb0510cd5bf04565be44c43da20169c7");
action.sessionId = "d69767ca64854cfb99960282fcdb8aed";
QueryHostAction.Result res = action.call();
```

Python SDK

```
QueryHostAction action = QueryHostAction()
action.conditions = ["uuid=2ddc05f8f46b4d5ab40053fdb72ae69d"]
action.sessionId = "96b183220af446c39d7cf2674761d85e"
```

```
QueryHostAction.Result res = action.call()
```

5.2.3.4 QueryHostOsCategory

API Request

URLs

```
GET zstack/v1/hosts/os/category
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/hosts/os/category?
q=architecture=x86_64&q=osReleaseVersion="helix core 7.6"
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryHost**, and pressing the **Tab** key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "architecture": "x86_64",
      "osReleaseVersion": "helix Core 7.6",
      "metadataList": [
        {
          "managementNodeUuid": "fe5459189a8733ef9b6b8141b84f7071",
          "hypervisor": "qemu-kvm",

		more information, see error .	

#inventories

Name	Type	Description	Satring Version
uuid	String	The UUID of the host or the VM instance.	4.6.21
hypervisor	String	The hypervisor name, such as qemu-kvm .	4.6.21
version	String	The version number, such as 4.2.0-632.g6a6222b.el7	4.6.21
matchState	String	Whether the current version is consistent with the recommended version. The values may be Matched , Unmatched , or Unknown	4.6.21
createDate	Timestamp	The creation date.	4.6.21
lastOpDate	Timestamp	The last operation date.	4.6.21

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.6.21
description	String	The brief description of the error.	4.6.21
details	String	The details about the error.	4.6.21

Name	Type	Description	Starting Version
elaboration	String	The reserved field. Default value: null.	4.6.21
opaque	LinkedHashMap	The reserved field. Default value: null.	4.6.21
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.6.21

SDK Sample

Java SDK

```
QueryKvmHypervisorInfoAction action = new QueryKvmHypervisorInfoAction();
action.conditions = asList("uuid=0601103239cd30c2bd738b98d4440199");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryKvmHypervisorInfoAction.Result res = action.call();
```

Python SDK

```
QueryKvmHypervisorInfoAction action = QueryKvmHypervisorInfoAction()
action.conditions = ["uuid=838e20e529cc3a19a9f0efa50e9e2409"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryKvmHypervisorInfoAction.Result res = action.call()
```

5.2.3.6 DeleteHost

API Request

URLs

```
DELETE zstack/v1/hosts/{uuid}?deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 999c480f7f344c3b803c3d74b82b7145" \
```

```
-X DELETE http://localhost:8080/zstack/v1/hosts/
bb2e5125ac2c4b3680463d7aeaf57773?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
deleteMode	String	body	Optional. The delete mode . Options: Permissive Enforcing. Default mode: Permissive.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteHostAction action = new DeleteHostAction();
action.uuid = "2d4b91d9831d4630bf113ea75f78cb7a";
action.deleteMode = "Permissive";
action.sessionId = "923c9089a5fd4ea5b9fbfc1dec5802e2";
DeleteHostAction.Result res = action.call();
```

Python SDK

```
DeleteHostAction action = DeleteHostAction()
action.uuid = "f62a37111c154ec9afeaeb2700ebcfe6"
```

```
action.deleteMode = "Permissive"
action.sessionId = "2aa7f575d8654712ba985f4a36594f0a"
DeleteHostAction.Result res = action.call()
```

5.2.3.7 UpdateHost

API Request

URLs

```
PUT zstack/v1/hosts/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateHost": {
    "name": "example",
    "description": "example",
    "managementIp": "192.168.0.1"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateHost":
{"name":"example","description":"example","managementIp":"192.168.0.1"}}' \
http://localhost:8080/zstack/v1/hosts/
fe98e821991a3c96af96fc7e458d2020/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the updateHost structure)	Optional. The resource name.		0.6
description	String	body (contained in the updateHost structure)	Optional. The detailed description of the resource.		0.6
management Ip	String	body (contained in the updateHost structure)	Optional. The IP address of the management node.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {
    "zoneUuid": "2adef89f417e40dbab643656bbdc6eab",
    "name": "example",
    "uuid": "aaeb1d3c1f5a43fd941bfebab10b9f34",

cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventory

Name	Type	Description	Starting Version
zoneUuid	String	The zone UUID.	0.6
name	String	The resource name.	0.6

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
clusterUuid	String	The cluster UUID.	0.6
description	String	The detailed description of the resource.	0.6
managementIp	String		0.6
hypervisorType	String		0.6
state	String		0.6
status	String		0.6
totalCpuCapacity	Long		0.6
availableCpuCapacity	Long		0.6
cpuSockets	Integer		0.6
totalMemoryCapacity	Long		0.6
availableMemoryCapacity	Long		0.6
cpuNum	Integer		0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6

SDK Sample

Java SDK

```
UpdateHostAction action = new UpdateHostAction();
action.uuid = "17aa30b0eb5849fca56804ddd5050c84";
action.name = "example";
action.description = "example";
action.managementIp = "192.168.0.1";
action.sessionId = "f303f20ae5b740468f56e8007acba81c";
UpdateHostAction.Result res = action.call();
```

Python SDK

```
UpdateHostAction action = UpdateHostAction()
action.uuid = "3925f7e788b54e86831644a6f85ea7c7"
action.name = "example"
action.description = "example"
action.managementIp = "192.168.0.1"
action.sessionId = "83a1c2866a8a42f98c66ed7196a58d75"
```

```
UpdateHostAction.Result res = action.call()
```

5.2.3.8 ChangeHostState

API Request

URLs

```
PUT zstack/v1/hosts/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeHostState": {
    "stateEvent": "enable"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"changeHostState":{"stateEvent":"enable"}}' \
http://localhost:8080/zstack/v1/
hosts/70e37940fe263e858a151850a312143f/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
stateEvent	String	body (contained in the changeHost	The target state of the host.	- enable - disable - maintain	0.6

Name	Type	Location	Description	Optional Value	Starting Version
		State structure)			
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {
    "zoneUuid": "faf35db46f044232a96b1c9ac228f7a1",

availableCpuCapacity	Long		0.6
cpuSockets	Integer		0.6
totalMemoryCapacity	Long		0.6

Name	Type	Description	Starting Version
availableMemoryCapacity	Long		0.6
cpuNum	Integer		0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6

SDK Sample

Java SDK

```
ChangeHostStateAction action = new ChangeHostStateAction();
action.uuid = "c5089a867d1c4d52a272b115da9fb51b";
action.stateEvent = "enable";
action.sessionId = "3523eb84bca24927b6c3a3177253ae55";
ChangeHostStateAction.Result res = action.call();
```

Python SDK

```
ChangeHostStateAction action = ChangeHostStateAction()
action.uuid = "16ae0707e32a4fc58153084e8649e8ab"
action.stateEvent = "enable"
action.sessionId = "dd5b5dd2df854908a044b74151f135e1"
ChangeHostStateAction.Result res = action.call()
```

5.2.3.9 ReconnectHost

API Request

URLs

```
PUT zstack/v1/hosts/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "reconnectHost": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"reconnectHost":{}}' \
http://localhost:8080/zstack/v1/
hosts/26caa95d6fb53d08ad6716ef03bf4b28/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
ReconnectHostAction action = new ReconnectHostAction();
action.uuid = "1c44c6b269724a62b7fb69bd25e5a8a9";
action.sessionId = "ccc6f95bad044da59080a87e710587c0";
ReconnectHostAction.Result res = action.call();
```

Python SDK

```
ReconnectHostAction action = ReconnectHostAction()
action.uuid = "562400a5ff1e4532aacedf708d3ad75e"
action.sessionId = "eb137b7f6e45448691b652fe4245a52b"
```

```
ReconnectHostAction.Result res = action.call()
```

5.2.3.10 GetHostAllocatorStrategies

API Request

URLs

```
GET zstack/v1/hosts/allocators/strategies
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \  
-H "Authorization: OAuth f8e76d7a6ec0461cab685e6bd9d724d2" \  
-X GET http://localhost:8080/zstack/v1/hosts/allocators/strategies
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	query	Optional. The system tags.		0.6
userTags	List	query	Optional. The user tags.		0.6

API Response

Sample Response

```
{  
  "hostAllocatorStrategies": [  
    "b39183b36b8e4cb386bd7bb45c7c1997",  
    "e01d613c77a44b65b6bef75b4ef2accb"  
  ]  
}
```

Name	Type	Description	Starting Version
strategies	List	The strategies.	0.6
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For	0.6

Name	Type	Description	Starting Version
		more information, see error .	

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

SDK Sample

Java SDK

```
GetHostAllocatorStrategiesAction action = new GetHostAllocatorStrategiesAction();
action.sessionId = "c10fb9fbab4744ecae6686b4193423e8";
GetHostAllocatorStrategiesAction.Result res = action.call();
```

Python SDK

```
GetHostAllocatorStrategiesAction action = GetHostAllocatorStrategiesAction()
action.sessionId = "caa6b3db2d5b42f79b44566b10763973"
```

```
GetHostAllocatorStrategiesAction.Result res = action.call()
```

5.2.3.11 GetHypervisorTypes

API Request

URLs

```
GET zstack/v1/hosts/hypervisor-types
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth fa53caa553b8446e9bb1c3ccae31cfd" \
-X GET http://localhost:8080/zstack/v1/hosts/hypervisor-types
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	query	Optional. The system tags.		0.6
userTags	List	query	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
GetHypervisorTypesAction action = new GetHypervisorTypesAction();
action.sessionId = "6e32c684aeab461db30fb6631a1ac898";
```

```
GetHypervisorTypesAction.Result res = action.call();
```

Python SDK

```
GetHypervisorTypesAction action = GetHypervisorTypesAction()
action.sessionId = "48f0a488d41d4f84b77c343a24e206e4"
GetHypervisorTypesAction.Result res = action.call()
```

5.2.3.12 GetCandidateNetworkInterfaces

API Request

URLs

```
GET zstack/v1/cluster/hosts-network-interfaces
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/cluster/hosts-network-
interfaces?
hostUuids=5712f3960ae23d24988f4e091bf5704f&slaveOnly=true&limit=1000&start=0
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
hostUuids	List	query	The host UUIDs.		4.7.0
limit	Integer	query	Optional.		4.7.0
start	Integer	query	Optional.		4.7.0
systemTags	List	query	Optional. The system tags.		4.7.0
userTags	List	query	Optional. The user tags.		4.7.0
slaveOnly (Optional)	boolean	query	Whether to obtain the information of slave network		4.7.11

Name	Type	Location	Description	Optional Value	Starting Version
			interfaces only		

API Response

Sample Response

```
{
  "slaveNames": [
    "eth0",
    "eth1"
  ]
}
```

Name	Type	Description	Starting Version
slaveUuids	List	The slave interface UUIDs.	4.7.0
success	boolean		4.7.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.7.0

#error

Name	Type	Description	Starting Version
description	String	The brief description of the error.	4.7.0
details	String	The details about the error.	4.7.0
elaboration	String	The reserved field. Default value: null.	4.7.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.7.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error	4.7.0

Name	Type	Description	Starting Version
		exists, this parameter is null.	
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.7.0

SDK Sample

Java SDK

```
GetCandidateNetworkInterfacesAction action = new GetCandidateNetworkI
nterfacesAction();
action.hostUuids = asList("5712f3960ae23d24988f4e091bf5704f");
action.slaveOnly = true;
action.limit = 1000;
action.start = 0;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetCandidateNetworkInterfacesAction.Result res = action.call();
```

Python SDK

```
GetCandidateNetworkInterfacesAction action = GetCandidateNetworkI
nterfacesAction()
action.hostUuids = [5712f3960ae23d24988f4e091bf5704f]
action.slaveOnly = true
action.limit = 1000
action.start = 0
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetCandidateNetworkInterfacesAction.Result res = action.call()
```

5.2.3.13 GetHostMultipathTopology

API Request

URLs

```
GET zstack/v1/storage-devices/multipath/topology
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X GET http://localhost:8080/zstack/v1/storage-devices/multipath/topology?hostUuid=da8052bf25c43b73ad0c9a7546d166ae&diskUuids=360014058e50754920324473a4c85c767
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
hostUuid	String	query	The host UUIDs.		5.3.0
diskUuids	List	query	The disk UUIDs.		5.3.0
systemTags	List	query	Optional. The system tags.		5.3.0
userTags	List	query	Optional. The user tags.		5.3.0

API Response

Sample Response

```
{
  "results": [
    {
      "diskUuid": "360014058e50754920324473a4c85c767",
      "devices": [
        {

```

5.2.3.14 GetCandidateInterfaceVlanIds

API Request

URLs

```
GET zstack/v1/host/network-interface-vlan-ids
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl示例

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/host/network-interface-vlan-ids?interfaceUuids=d25e83af6ccf3d9ca8baa1702861a0c8&limit=1000&start=0
```

参数列表

Name	Type	Location	Description	Optional Value	Starting Version
interfaceUuids	List	query	The NIC port UUIDs		4.7.11
limit	Integer	query			4.7.11
start	Integer	query			4.7.11
systemTags	List	query	Optional. The system tags.		4.7.11
userTags	List	query	Optional. The user tags.		4.7.11

API Response

Sample Response

```
{
  "vlanIds": [
    1010,
    1011,
    10,
    11,
    2000,
    1101,
    1110,
    1108,
```

```

        1107,
        1109,
        1106,
        1103,
        1102,
        1105,
        1104,
        0
    ],
    "success": true
}

```

Name	Type	Description	Starting Version
vlanIds	List	The Vlan interface ID list.	4.7.11
success	boolean		4.7.11
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error	4.7.11

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	4.7.11
description	String	The brief description of the error.	4.7.11
details	String	The details about the error.	4.7.11
elaboration	String	The reserved field. Default value: null.	4.7.11
opaque	LinkedHashMap	The reserved field. Default value: null.	4.7.11
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error	4.7.11

Name	Type	Description	Starting Version
		exists, this parameter is null.	

SDK Sample

Java SDK

```
GetCandidateInterfaceVlanIdsAction action = new GetCandidateInterfaceVlanIdsAction();
action.interfaceUuids = asList("d25e83af6ccf3d9ca8baa1702861a0c8");
action.limit = 1000;
action.start = 0;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetCandidateInterfaceVlanIdsAction.Result res = action.call();
```

Python SDK

```
GetCandidateInterfaceVlanIdsAction action = GetCandidateInterfaceVlanIdsAction()
action.interfaceUuids = [d25e83af6ccf3d9ca8baa1702861a0c8]
action.limit = 1000
action.start = 0
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetCandidateInterfaceVlanIdsAction.Result res = action.call()
```

5.2.3.15 SetIpOnHostNetworkBonding

API Request

URLs

```
POST zstack/v1/hosts/bondings/{bondingUuid}/ip
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "ipAddress": "1.1.1.1",
    "netmask": "255.255.0.0"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"ipAddress":"1.1.1.1","netmask":"255.255.0.0"}}'
http://localhost:8080/zstack/v1/hosts/bondings/
d4671664bb2a38479eddedbe4633121b/ip
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
bondingUuid	String	url	The bond UUID.		4.7.0
ipAddress	String	body (contained in the params structure)	Optional. The IP address.		4.7.0
netmask	String	body (contained in the params structure)	Optional. The netmask.		4.7.0
isDefaultRoute	Boolean	body (contained in the params structure)	Optional. Whether to set a default route.		4.7.0
systemTags	List	body	Optional. The system tags.		4.7.0
userTags	List	body	Optional. The user tags.		4.7.0

API Response

Sample Response

```
{
  "inventory": {
    "hostUuid": "00949fb236003bbf85cfd151becdc8cf",
    "ipAddresses": [
      "192.168.1.1"
    ]
  }
}
```

```
}
}
```

Name	Type	Description	Starting Version
success	boolean		4.7.0
inventory	HostNetworkBondingInventory	See inventory .	4.7.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.7.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	4.7.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.7.0
description	String	The brief description of the error.	4.7.0
details	String	The details about the error.	4.7.0
elaboration	String	The reserved field. Default value: null.	4.7.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.7.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.7.0

SDK Sample

Java SDK

```

SetIpOnHostNetworkBondingAction action = new SetIpOnHostNetworkBo
ndingAction();
action.bondingUuid = "d4671664bb2a38479eddedbe4633121b";
action.ipAddress = "1.1.1.1";
action.netmask = "255.255.0.0";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
SetIpOnHostNetworkBondingAction.Result res = action.call();

```

Python SDK

```

SetIpOnHostNetworkBondingAction action = SetIpOnHostNetworkBo
ndingAction()

```

```

action.bondingUuid = "d4671664bb2a38479eddedbe4633121b"
action.ipAddress = "1.1.1.1"
action.netmask = "255.255.0.0"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
SetIpOnHostNetworkBondingAction.Result res = action.call()

```

5.2.3.16 SetIpOnHostNetworkInterface

API Request

URLs

```
POST zstack/v1/hosts/nics/{interfaceUuid}/ip
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```

{
  "params": {
    "ipAddress": "1.1.1.1",
    "netmask": "255.255.0.0"
  },
  "systemTags": [],
  "userTags": []
}

```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params": {"ipAddress": "1.1.1.1", "netmask": "255.255.0.0"}}' http://localhost:8080/zstack/v1/hosts/nics/d50ade48aec73edc87b0f7c2d6a84bcc/ip

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
interfaceUuid	String	url	The physical NIC port UUID		4.7.0

Name	Type	Location	Description	Optional Value	Starting Version
Optional. The user tags.	String	body (contained in the params structure)	Optional. The IP address.		4.7.0
Optional. The user tags.	String	body (contained in the params structure)	Optional. The netmask.		4.7.0
Optional. The user tags.	Boolean	body (contained in the params structure)	Optional. Whether to set a default route.		4.7.0
Optional. The user tags.	List	body	Optional. The system tags.		4.7.0
Optional. The user tags.	List	body	Optional. The user tags.		4.7.0

API Response

Sample Response

```
{

cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.7.0

SDK Sample

Java SDK

```
SetIpOnHostNetworkInterfaceAction action = new SetIpOnHostNetworkIn
terfaceAction();
action.interfaceUuid = "d50ade48aec73edc87b0f7c2d6a84bcc";
action.ipAddress = "1.1.1.1";
action.netmask = "255.255.0.0";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
SetIpOnHostNetworkInterfaceAction.Result res = action.call();
```

Python SDK

```
SetIpOnHostNetworkInterfaceAction action = SetIpOnHostNetworkIn
terfaceAction()
action.interfaceUuid = "d50ade48aec73edc87b0f7c2d6a84bcc"
action.ipAddress = "1.1.1.1"
action.netmask = "255.255.0.0"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
SetIpOnHostNetworkInterfaceAction.Result res = action.call()
```

5.2.3.17 UpdateBonding

API Request

URLs

```
PUT zstack/v1/hosts/bondings/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateBonding": {
    "mode": "802.3ad",
    "xmitHashPolicy": "layer2+3"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateBonding":
{"mode":"802.3ad","xmitHashPolicy":"layer2+3"}}'
http://localhost:8080/zstack/v1/hosts/
bondings/1facb0c5125037a5bc4167cd2ad30d1f/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		4.7.0
slaveUuids	List	body (contained in the	Optional. The slave NIC UUIDs list.		5.0.0

Name	Type	Location	Description	Optional Value	Starting Version
		updateBonding structure)			
slaveNames	List	body (contained in the updateBonding structure)	Optional. The slave name list.		5.0.0
type	String	body (contained in the updateBonding structure)	Optional. The bond type.	- LinuxBonding - OvsBonding	4.7.0
mode	String	body (contained in the updateBonding structure)	Optional. The bond mode.	802.3ad - active-backup	4.7.0
xmitHashPolicy	String	body (contained in the updateBonding structure)	Optional. The hash policy.	- layer2 - layer2+3 - layer3+4	4.7.0
description	String	body (contained in the updateBonding structure)	Optional. The resource description.		4.7.0
systemTags	List	body	Optional. The system tags.		4.7.0
userTags	List	body	Optional. The user tags.		4.7.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
```

```

    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}

```

SDK Sample

Java SDK

```

UpdateBondingAction action = new UpdateBondingAction();
action.uuid = "1facb0c5125037a5bc4167cd2ad30d1f";
action.mode = "802.3ad";
action.xmitHashPolicy = "layer2+3";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateBondingAction.Result res = action.call();

```

Python SDK

```

UpdateBondingAction action = UpdateBondingAction()
action.uuid = "1facb0c5125037a5bc4167cd2ad30d1f"
action.mode = "802.3ad"
action.xmitHashPolicy = "layer2+3"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateBondingAction.Result res = action.call()

```

5.2.3.18 AttachNicToBonding

API Request

URLs

```
PUT zstack/v1/hosts/bondings/{uuid}/attach
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```

{
  "attachNicToBonding": {
    "slaveUuids": [
      "9cc96c09880135db95e1b7d677607d6e"
    ],
    "type": "LinuxBonding"
  },
  "systemTags": [],
  "userTags": []
}

```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"attachNicToBonding":{"slaveUuids":
["9cc96c09880135db95e1b7d677607d6e"],"type":"LinuxBonding"}}' \
http://localhost:8080/zstack/v1/hosts/
bondings/1facb0c5125037a5bc4167cd2ad30d1f/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		5.0.0
slaveUuids	List	body (contained in the attachNicToBonding structure)	The slave NIC UUIDs.		5.0.0
type	String	body (contained in the attachNicToBonding structure)	Optional. The bond type.	- LinuxBonding - OvsBonding	5.0.0
systemTags	List	body	Optional. The system tags.		5.0.0
userTags	List	body	Optional. The user tags.		5.0.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
}
```

SDK Sample

Java SDK

```
AttachNicToBondingAction action = new AttachNicToBondingAction();
action.uuid = "e1fa374a84f231c681df08101f0ddd99";
action.slaveUuids = asList("9cc96c09880135db95e1b7d677607d6e");
action.type = "LinuxBonding";

    "username": "userName",
    "password": "password",
    "sshPort": 22,
    "name": "newHost",
    "managementIp": "127.0.0.1",
    "clusterUuid": "449c63f16f9144528d99315f903be36e"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"username": "userName", "password": "password", "sshPort": "22", "name": "newHost", "man
```

```
http://localhost:8080/zstack/v1/hosts/kvm
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
username	String	body (contained in the params structure)	The SSH username.		0.6
password	String	body (contained in the params structure)	The SSH password.		0.6
sshPort	int	body (contained in the params structure)	Optional. The SSH port No.		0.6
name	String	body (contained in the params structure)	The resource name.		0.6
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		0.6
management Ip	String	body (contained in the params structure)	The IP address of the host management node.		0.6
clusterUuid	String	body (contained in the params structure)	The cluster UUID.		0.6
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

**Note:**

- When you create a KVM host in ZStack Cloud, you can disable EPT by adding the **disable EPT** option to **SystemTags**.
 - Format of the **disable EPT** option: `pageTableExtensionDisabled`
 - Example: `pageTableExtensionDisabled`

API Response

```

5.2.3.24 AddKVMHostFromConfigFile

API Request

URLs

```
POST zstack/v1/hosts/kvm/from-file
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "hostInfo": "FILE CONTENT ENCODE BY BASE64"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"hostInfo":"FILE CONTENT ENCODE BY BASE64"}}'
http://localhost:8080/zstack/v1/hosts/kvm/from-file
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
hostInfo	String	body (contained in the params structure)	The host information encoded in Base64 format		3.1.0
resourceUuid	String	body (contained in	Optional. The resource UUID.		3.1.0

Name	Type	Location	Description	Optional Value	Starting Version
		the params structure)			
systemTags	List	body	Optional. The system tags.		3.1.0
userTags	List	body	Optional. The user tags.		3.1.0

API Response

Sample Response

```
{
  "results": [
    {
      "ip": "127.0.0.1",
      "success": true
    }
  ]
}
```

Name	Type	Description	Starting Version
success	boolean		3.1.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.1.0
results	List	See results .	3.1.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.1.0
description	String	The brief description of the error.	3.1.0

Name	Type	Description	Starting Version
details	String	The details about the error.	3.1.0
elaboration	String	The reserved field. Default value: null.	3.1.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.1.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.1.0

#results

Name	Type	Description	Starting Version
ip	String	The host IP address.	3.1.0
success	boolean		3.1.0
error	ErrorCode	See error .	3.1.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	3.1.0

opaque	LinkedHashMap	The reserved field. Default value: null.	3.1.0

Name	Type	Description	Starting Version
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.1.0

SDK Sample

Java SDK

```
AddKVMHostFromConfigFileAction action = new AddKVMHostFromConfigFileAction();
action.hostInfo = "FILE CONTENT ENCODE BY BASE64";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
AddKVMHostFromConfigFileAction.Result res = action.call();
```

Python SDK

```
AddKVMHostFromConfigFileAction action = AddKVMHostFromConfigFileAction()
action.hostInfo = "FILE CONTENT ENCODE BY BASE64"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
AddKVMHostFromConfigFileAction.Result res = action.call()
```

5.2.3.25 CheckKVMHostConfigFile

API Request

URLs

```
POST /v1/hosts/kvm/from-file/check
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "hostInfo": "FILE CONTENT ENCODE BY BASE64"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"hostInfo":"FILE CONTENT ENCODE BY BASE64"}}'
http://localhost:8080/zstack/v1/hosts/kvm/from-file/check
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
hostInfo	String	body (contained in the params structure)	The host information encoded in Base64 format.		3.1.0
systemTags	List	body	Optional. The system tags.		3.1.0
userTags	List	body	Optional. The user tags.		3.1.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
CheckKVMHostConfigFileAction action = new CheckKVMHostConfigFileAction();
action.hostInfo = "FILE CONTENT ENCODE BY BASE64";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
CheckKVMHostConfigFileAction.Result res = action.call();
```

Python SDK

```
CheckKVMHostConfigFileAction action = CheckKVMHostConfigFileAction()
action.hostInfo = "FILE CONTENT ENCODE BY BASE64"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CheckKVMHostConfigFileAction.Result res = action.call()
```

5.2.3.26 SetServiceTypeOnHostNetworkInterface

API Request

URLs

```
POST zstack/v1/hosts/nics/service-types
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "interfaceUuids": [
      "2894f52c7d84366c85dd115b3bc193ca"
    ]
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"interfaceUuids":
["2894f52c7d84366c85dd115b3bc193ca"]}}' \
http://localhost:8080/zstack/v1/hosts/nics/service-types
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
interfaceUuids	List	body (contained in the params structure)	The physical NIC port UUID list.		4.7.11
vlanIds	List	body (contained in the params structure)	Optional. The VLAN interface ID list.		4.7.11
serviceTypes	List	body (contained in the params structure)	Optional. The network type.	• Management Network • TenantNetwork • StorageNetwork • BackupNetwork • MigrationNetwork	4.7.11
systemTags	List	body	Optional. The system tags.		4.7.11
userTags	List	body	Optional. The user tags.		4.7.11

API Response

Sample Response

```
{
  "inventory": [
    {
      "id": 0,
      "interfaceUuid": "8534263f624a3962b7603c99a3e44eb2",
      "vlanId": 10,
      "serviceType": "BackupNetwork"
    }
  ]
}
```

Name	Type	Description	Starting Version
success	boolean		4.7.11

service-type-statistic? \
interfaceUuid=d8797841479d3951bcb698164b56bd9e&interfaceType=All&sortBy=CreateDate
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
interfaceUuid	String	query	Optional. The NIC port UUID.		4.7.11
vlanId	Integer	query	Optional. The VLAN interface ID.		4.7.11
interfaceType	String	query	Optional. The NIC port type.	- All - Interface - Bonding	4.7.11
serviceType	List	query	Optional. The network type.	- All - Management Network - TenantNetwork - StorageNetwork - MigrationNetwork	4.7.11

Name	Type	Location	Description	Optional Value	Starting Version
				BackupNetwork	
zoneUuid	String	query	Optional. The zone UUID.		4.7.11
clusterUuid	String	query	Optional. The cluster UUID.		4.7.11
hostUuid	String	query	Optional. The host UUID.		4.7.11
sortBy	String	query	Optional. The sort method.	- InterfaceName - VlanId - HostIp - HostName - ClusterName - CreateDate	4.7.11
sortDirection	String	query	Optional. The sort direction.	- asc - desc	4.7.11
start	Integer	query	Optional. The location where the statistics starts.		4.7.11
limit	Integer	query	Optional. The count of the statistics.		4.7.11
replyWithCount	boolean	query	Optional. Whether to return both the statistics result and count.		4.7.11
systemTags	List	query	Optional. The system tags.		4.7.11
userTags	List	query	Optional. The user tags.		4.7.11

API Response

Sample Response

```
{
  "serviceTypeStatistics": [
    {
      "interfaceUuid": "474f9d7d7a1d3b46b8f17363dca7ebef",
      "serviceTypes": [
        "ManagementNetwork"
      ]
    }
  ],
  "total": 1
}
```

Name	Type	Description	Starting Version
total	Long	The total count of the statistics.	4.7.11
success	boolean	Whether the API succeeds.	4.7.11
serviceTypeStatistics	List	See serviceTypeStatistics .	4.7.11
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error	4.7.11

#serviceTypeStatistics

名字	类型	描述	起始版本
interfaceUuid	String	The network interface UUID.	4.7.11
interfaceName	String	The network interface name.	4.7.11
vlanId	Integer	The vlan interface ID.	4.7.11
serviceTypes	List	The network type list.	4.7.11
hostUuid	String	The host UUID.	4.7.11
hostName	String	The host name.	4.7.11
hostIp	String	The host IP.	4.7.11
clusterUuid	String	The cluster UUID.	4.7.11

名字	类型	描述	起始版本
clusterName	String	The cluster name.	4.7.11
zoneUuid	String	The zone UUID.	4.7.11
createDate	Timestamp	The date of creation.	4.7.11

#error

名字	类型	描述	起始版本
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

SDK Sample

Java SDK

```

GetInterfaceServiceTypeStatisticAction action = new GetInterfaceServiceTypeStatisticAction();
action.interfaceUuid = "d8797841479d3951bcb698164b56bd9e";
action.interfaceType = "All";

opaque	LinkedHashMap	The reserved field. Default value: null.	4.3.12
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.3.12

#topology

Name	Type	Description	Starting Version
cpus	array[string]	The CPU IDs of the pNUMA node.	4.3.12
size	long	The total memory size of the NUMA node, in the unit of B.	4.3.12
distance	array[string]	The distance of the pNUMA node with another node.	4.3.12
VMsUuid	array[string]	The UUIDs of the VM instances associated with the pNUMA node.	4.3.12
free	long	The free memory size of the pNUMA node, in the unit of B.	4.3.12

SDK Sample

Java SDK

```
GetHostNUMATopologyAction action = new GetHostNUMATopologyAction();
action.uuid = "2b8e587e99093c46b27e774dfe93024f";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetHostNUMATopologyAction.Result res = action.call();
```

Python SDK

```
GetHostNUMATopologyAction action = new GetHostNUMATopologyAction();
```

```
action.uuid = "2b8e587e99093c46b27e774dfe93024f";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetHostNUMATopologyAction.Result res = action.call();
```

5.2.3.34 AllocateHostResource

API Request

URLs

```
POST zstack/v1/hosts/{uuid}/allocate-resource
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "strategy": "continuous",
    "scene": "normal",
    "vcpu": 2,
    "memSize": 1234567
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"strategy":"continuous","scene":"normal","vcpu":2,"memSize":1234567}}'
http://localhost:8080/zstack/v1/
hosts/0ce1fccc44b53601a54c3090233c07dd/allocate-resource
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		4.7.11

Name	Type	Location	Description	Optional Value	Starting Version
strategy	String	body (contained in the params structure)	The resource allocation policy.	continuous	4.7.11
scene	String	body (contained in the params structure)	The scene type.	- normal - performance	4.7.11
vcpu	int	body (contained in the params structure)	The number of vCPUs that need to be allocated to a VM instance.		4.7.11
memSize	Long	body (contained in the params structure)	Optional. The memory size of the vNUMA node.		4.7.11
systemTags	List	body	Optional. The system tags.		4.7.11
userTags	List	body	Optional. The user tags.		4.7.11

API Response

Sample Response

```
{
  "name": "example",
  "uuid": "f7bae73b9874344b8766dfcdda48ad6e",
  "vCPUPin": [
    {
      "vCPU": "0",
      "pCPU": "13"
    }
  ]
}
```

Name	Type	Description	Starting Version
success	boolean		4.7.11
name	String	The resource name.	4.7.11

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	4.7.11
vCPUPin	List	The CPU pinning.	4.7.11
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error	4.7.11

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.7.11
description	String	The short description of the error.	4.7.11
details	String	The details about the error.	4.7.11
elaboration	String	The reserved field. Default value: null.	4.7.11
opaque	LinkedHashMap	The reserved field. Default value: null.	4.7.11
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.7.11

SDK Sample

Java SDK

```
AllocateHostResourceAction action = new AllocateHostResourceAction();
action.uuid = "0ce1fccc44b53601a54c3090233c07dd";
action.strategy = "continuous";
action.scene = "normal";
```

```
action.vcpu = 2;
action.memSize = 1234567;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
AllocateHostResourceAction.Result res = action.call();
```

Python SDK

```
AllocateHostResourceAction action = AllocateHostResourceAction()
action.uuid = "0ce1fccc44b53601a54c3090233c07dd"
action.strategy = "continuous"
action.scene = "normal"
action.vcpu = 2
action.memSize = 1234567
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
AllocateHostResourceAction.Result res = action.call()
```

5.2.3.35 GetHostResourceAllocation

API Request

URLs

```
POST zstack/v1/hosts/{uuid}/resource-allocation
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "strategy": "continuous",
    "scene": "normal",
    "vcpu": 60
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST //localhost:8080/zstack/v1/
hosts/21529457e42c30f0a9b2a137915a0b28/resource-allocation -d
```

```
'{"params": {"strategy": "continuous", "scene": "normal", "vcpu": 60}}'
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The host UUID.		4.3.12
strategy	String	body(contained in the params structure)	The resource allocation policy.	continuous	4.3.12
scene	String	body(contained in the params structure)	The scene type.	- normal - performance	4.3.12
vcpu	String	body(contained in the params structure)	The number of vCPUs that need to be allocated to a VM instance.	[1,512]	4.3.12

API Response

Sample Response

```
{
  "name": "example",

```

5.2.3.36 GetHostPowerStatus

API Request

URLs

```
PUT zstack/v1/hosts/power/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "getHostPowerStatus": {
    "method": "AUTO"
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"getHostPowerStatus":{"method":"AUTO"}}' //
localhost:8080/zstack/v1/hosts/power/12d6c065d8cb3e128b5c33f7c619f65f/
actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		4.7.0
method	String	body (contained in the getHostPowerStatus structure)	Optional. The method to get the host power status.	- AUTO - AGENT - IPMI	4.7.0
systemTags	List	body	Optional. The system tags.		4.7.0
userTags (可选)	List	body	Optional. The user tags.		4.7.0

API Response**Sample Response**

```
{
  "inventory": {
    "ipmiAddress": "192.168.0.1",
    "ipmiUsername": "admin",
    "ipmiPort": 623,
    "ipmiPassword": "password",
    "ipmiPowerStatus": "POWER_ON"
  }
}
```

}

Name	Type	Description	Starting Version
success			4.7.0
inventory		See inventory .	4.7.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.7.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	4.7.0
ipmiAddress	String	The IPMI address.	4.7.0
ipmiUsername	String	The IPMI user name.	4.7.0
ipmiPort	int	The IPMI port.	4.7.0
ipmiPowerStatus	String	The IPMI power status.	4.7.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.7.0
description	String	The brief description of the error.	4.7.0
details	String	The details about the error.	4.7.0
elaboration	String	The reserved field. Default value: null.	4.7.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.7.0

Name	Type	Description	Starting Version
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.7.0

SDK Sample

Java SDK

```
GetHostPowerStatusAction action = new GetHostPowerStatusAction();
action.uuid = "12d6c065d8cb3e128b5c33f7c619f65f";
action.method = "AUTO";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetHostPowerStatusAction.Result res = action.call();
```

Python SDK

```
GetHostPowerStatusAction action = GetHostPowerStatusAction()
action.uuid = "12d6c065d8cb3e128b5c33f7c619f65f"
action.method = "AUTO"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetHostPowerStatusAction.Result res = action.call()
```

5.2.3.37 GetHostWebSshUrl

API Request

URLs

```
POST zstack/v1/hosts/webssh
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "uuid": "1e6eb11de9d5347e9a5bc72269f45247",
    "https": false
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"uuid":"1e6eb11de9d5347e9a5bc72269f45247","https":false}}' //
localhost:8080/zstack/v1/hosts/webssh
```

Request Parameters

Name	Type	Location	Description	Valid Values	Starting Version
uuid	String	body (contained in the params structure)	The resource UUID.		4.7.0
systemTags	List	body	Optional. The system tags.		4.7.0
userTags	List	body	Optional. The user tags.		4.7.0
https (可选)	Boolean	body (contained in the params structure)			4.7.11

API Response**Sample Response**

```
{
  "url": "ws://{ip}:8888/ws?id\u003d140147795208568"
}
```

Name	Type	Description	Starting Version
url	String	The host URL.	4.7.0
success			4.7.0

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.7.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.7.0
description	String	The brief description of the error.	4.7.0
details	String	The details about the error.	4.7.0
elaboration	String	The reserved field. Default value: null.	4.7.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.7.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.7.0

SDK Sample

Java SDK

```

GetHostWebSshUrlAction action = new GetHostWebSshUrlAction();
action.uuid = "1e6eb11de9d5347e9a5bc72269f45247";
action.https = false;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";

```

```
GetHostWebSshUrlAction.Result res = action.call();
```

Python SDK

```
GetHostWebSshUrlAction action = GetHostWebSshUrlAction()
action.uuid = "1e6eb11de9d5347e9a5bc72269f45247"
action.https = false
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetHostWebSshUrlAction.Result res = action.call()
```

5.2.3.38 PowerOnHost

API Request

URLs

```
PUT zstack/v1/hosts/power/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "powerOnHost": {
    "returnEarly": false
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"powerOnHost":{"returnEarly":false}}' //
localhost:8080/zstack/v1/hosts/power/494e84c334963183bfeef342e38bf4b4/
actions
```

Request Parameters

Name	Type	Location	Description	Valid Values	Starting Version
uuid	String	url	The resource UUID.		4.7.0
returnEarly	boolean	body (contained in the powerOnHost structure)	Optional. Whether to make the result returned earlier.		4.7.0
systemTags	List	body	Optional. The system tags.		4.7.0
userTags	List	body	Optional. The user tags.		4.7.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
PowerOnHostAction action = new PowerOnHostAction();
action.uuid = "494e84c334963183bfeef342e38bf4b4";
action.returnEarly = false;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
PowerOnHostAction.Result res = action.call();
```

Python SDK

```
PowerOnHostAction action = PowerOnHostAction()
action.uuid = "494e84c334963183bfeef342e38bf4b4"
action.returnEarly = false
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
PowerOnHostAction.Result res = action.call()
```

5.2.3.39 PowerResetHost

API Request

URLs

```
PUT zstack/v1/hosts/power/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "powerResetHost": {
    "returnEarly": false,
    "method": "AUTO"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"powerResetHost":
{"returnEarly":false,"method":"AUTO"}}' //localhost:8080/zstack/v1/
hosts/power/cbe0a6dc2b2b3dc9a84928f27461816b/actions
```

Request Parameters

Name	Type	Location	Description	Valid Values	Starting Version
uuid	String	url	The resource UUID.		4.7.0
method	String	body (contained in the powerReset	Optional. The method to reboot the host.	- AUTO - AGENT - IPMI	4.7.0

Name	Type	Location	Description	Valid Values	Starting Version
		Host structure)			
systemTags	List	body	Optional. The system tags.		4.7.0
userTags (可选)	List	body	Optional. The user tags.		4.7.0
returnEarly	boolean	body (contained in the powerReset Host structure)	Optional. Whether to make the result returned earlier.		4.7.0

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
PowerResetHostAction action = new PowerResetHostAction();
action.uuid = "cbe0a6dc2b2b3dc9a84928f27461816b";
action.returnEarly = false;
action.method = "AUTO";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
PowerResetHostAction.Result res = action.call();
```

Python SDK

```
PowerResetHostAction action = PowerResetHostAction()
action.uuid = "cbe0a6dc2b2b3dc9a84928f27461816b"
action.returnEarly = false
action.method = "AUTO"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
PowerResetHostAction.Result res = action.call()
```

5.2.3.40 ShutdownHost

API Request

URLs

```
PUT zstack/v1/hosts/power/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "shutdownHost": {
    "returnEarly": false,
    "force": false,
    "method": "AUTO"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"shutdownHost":
{"returnEarly":false,"force":false,"method":"AUTO"}}' //
localhost:8080/zstack/v1/hosts/power/700457ff11133edf93541013f6caf8e7/
actions
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
uuid	String	url	The resource UUID.		4.7.0
returnEarly	boolean	body (contained in the	Optional. Whether to make the		4.7.0

Name	Type	Location	Description	Valid Value	Starting Version
		shutdownHost structure)	result returned earlier.		
force	boolean	body (contained in the shutdownHost structure)	Optional. Whether to forcefully power off the host.		0.6
method	String	body (contained in the shutdownHost structure)	Optional. The method to power off the host.	- AUTO - AGENT - IPMI	4.7.0
systemTags	List	body	Optional. The system tags.		4.7.0
userTags	List	body	Optional. The user tags.		4.7.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
ShutdownHostAction action = new ShutdownHostAction();
action.uuid = "700457ff11133edf93541013f6caf8e7";
action.returnEarly = false;
action.force = false;
action.method = "AUTO";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
ShutdownHostAction.Result res = action.call();
```

Python SDK

```
ShutdownHostAction action = ShutdownHostAction()
action.uuid = "700457ff11133edf93541013f6caf8e7"
action.returnEarly = false
action.force = false
action.method = "AUTO"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
ShutdownHostAction.Result res = action.call()
```

5.2.3.41 UpdateHostIpmi

API Request

URLs

```
PUT zstack/v1/hosts/ipmi/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateHostIpmi": {
    "ipmiAddress": "127.0.0.10",
    "ipmiUsername": "admin",
    "ipmiPassword": "password",
    "ipmiPort": 623
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \-X PUT -d
'{"updateHostIpmi":
{"ipmiAddress":"127.0.0.10","ipmiUsername":"admin","ipmiPassword":"password","ipmiPort":623},
"systemTags": [],
"userTags": []}'
http://localhost:8080/zstack/v1/hosts/
ipmi/6cbd75f1a7cb3805b47a8dca8871c1c6/actions
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
uuid	String	url	The resource UUID.		4.7.0
ipmiAddress	String	body (contained in the updateHostIpmi structure)	Optional. The IPMI address.		4.7.0
ipmiUsername	String	body (contained in the updateHostIpmi structure)	Optional. The IPMI user name.		4.7.0
ipmiPassword	String	body (contained in the updateHostIpmi structure)	Optional. The IPMI password.		4.7.0
ipmiPort	int	body (contained in the updateHostIpmi structure)	Optional. The IPMI port.		4.7.0
systemTags	List	body	Optional. The system tags.		4.7.0
userTags	List	body	Optional. The user tags.		4.7.0

API Response

Sample Response

```
{
  "hostIpmiInventory": {
    "ipmiAddress": "192.168.0.1",
    "ipmiUsername": "admin",
    "ipmiPort": 623,
    "ipmiPassword": "password"
  }
}
```

}

Name	Type	Description	Starting Version
success	boolean		4.7.0
hostIpmlInventory	HostIpmlInventory	See	4.7.0
error	ErrorCode	The error code. If not null, the operation fails , or vice versa. For more information, see	4.7.0

#hostIpmlInventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	4.7.0
ipmiAddress	String	The IPMI address.	4.7.0
ipmiUsername	String	The IPMI user name.	4.7.0
ipmiPort	int	The IPMI port.	4.7.0
ipmiPowerStatus	String	The IPMI power status .	4.7.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	4.7.0
description	String	The brief description of the error.	4.7.0
details	String	The details about the error.	4.7.0
elaboration	String	The reserved field. Default value: null.	4.7.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.7.0

Name	Type	Description	Starting Version
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.7.0

SDK Sample

Java SDK

```
UpdateHostIpmiAction action = new UpdateHostIpmiAction();
action.uuid = "6cbd75f1a7cb3805b47a8dca8871c1c6";
action.ipmiAddress = "127.0.0.10";
action.ipmiUsername = "admin";
action.ipmiPassword = "password";
action.ipmiPort = 623;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateHostIpmiAction.Result res = action.call();
```

Python SDK

```
UpdateHostIpmiAction action = UpdateHostIpmiAction()
action.uuid = "6cbd75f1a7cb3805b47a8dca8871c1c6"
action.ipmiAddress = "127.0.0.10"
action.ipmiUsername = "admin"
action.ipmiPassword = "password"
action.ipmiPort = 623
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateHostIpmiAction.Result res = action.call()
```

5.2.3.42 PCI Device Operations

5.2.3.42.1 QueryPciDevice

API Request

URL

```
GET zstack/v1/pci-device/pci-devices
GET zstack/v1/pci-device/pci-devices/{uuid}
```

Header

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 043ef942ef97460bba5c9381bb7a7455" \
```

```
-X GET http://localhost:8080/zstack/v1/pci-device/pci-devices
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 4af958832a32465aa544c3d7722af1da" \
-X GET http://localhost:8080/zstack/v1/pci-device/pci-devices/5b39eaae24e84e4ca7eb0bc56d6827c1
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryPciDevice`, and pressing the **Tab** key.

API Response

Sample Response

```
{
  "inventories": [
    {}
  ]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.1
inventories	List	See inventories .	2.1

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6

Name	Type	Description	Starting Version
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventories

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	2.1
name	String	The resource name.	3.5.0
description	String	The detailed description of the resource.	2.1
hostUuid	String	The host UUID.	2.1
parentUuid	String	The UUID of the physical PCI device.	3.5.0
vmInstanceUuid	String	The VM instance UUID.	2.1
pciSpecUuid	String	The UUID of the PCI device specification.	3.5.0
vendorId	String	The vendor ID.	2.1
deviceId	String	The device ID.	2.1
subvendorId	String	The sub-vendor ID.	2.1

pciDeviceOfferingUuid	String		2.1

#mdevSpecRefs

Name	Type	Description	Starting Version
pciDeviceUuid	String	The PCI device UUID.	3.5.0
mdevSpecUuid	String	The UUID of the MDEV device specification.	3.5.0
effective	Boolean	Whether the current MDEV device specification is used to segment the PCI device.	3.5.0
createDate	Timestamp	The creation date.	3.5.0
lastOpDate	Timestamp	The last operation date.	3.5.0

SDK Sample

Java SDK

```
QueryPciDeviceAction action = new QueryPciDeviceAction();
action.conditions = asList();
action.sessionId = "9895783acb8541c6938417b602429219";
QueryPciDeviceAction.Result res = action.call();
```

Python SDK

```
QueryPciDeviceAction action = QueryPciDeviceAction()
action.conditions = []
action.sessionId = "515d02b3a2094575beadbf3db7127880"
```

```
QueryPciDeviceAction.Result res = action.call()
```

5.2.3.42.2 UpdatePciDevice

API Request

URL

```
PUT zstack/v1/pci-device/pci-devices/{uuid}/actions
```

Header

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updatePciDevice": {
    "state": "Disabled",
    "description": "test pci",
    "metaData": "key1:value1;key2:value2"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updatePciDevice":{"state":"Disabled","description":"test pci","metaData":"key1:value1;key2:value2"}}' \
http://localhost:8080/zstack/v1/pci-device/pci-devices/4bec7e7c2c1e337599e0455165906fd5/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.1
state	String	body (contained in the	Optional. The state.	- Enabled - Disabled	2.1

Name	Type	Location	Description	Optional Value	Starting Version
		updatePciDevice structure)			
description	String	body (contained in the updatePciDevice structure)	Optional. The detailed description of the resource.		2.1
metaData	String	body (contained in the updatePciDevice structure)	Optional. The metadata.		2.1
systemTags	List	body	Optional. The system tags.		2.1
userTags	List	body	Optional. The user tags.		2.1

effective	Boolean	Whether the current MDEV device specification is used to segment the PCI device.	3.5.0
createDate	Timestamp	The creation date.	3.5.0
lastOpDate	Timestamp	The last operation date.	3.5.0

SDK Sample

Java SDK

```
UpdatePciDeviceAction action = new UpdatePciDeviceAction();
action.uuid = "4bec7e7c2c1e337599e0455165906fd5";
action.state = "Disabled";
action.description = "test pci";
action.metadata = "key1:value1;key2:value2";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdatePciDeviceAction.Result res = action.call();
```

Python SDK

```
UpdatePciDeviceAction action = UpdatePciDeviceAction()
action.uuid = "4bec7e7c2c1e337599e0455165906fd5"
action.state = "Disabled"
action.description = "test pci"
action.metadata = "key1:value1;key2:value2"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
UpdatePciDeviceAction.Result res = action.call()
```

5.2.3.42.3 DeletePciDevice

API Request

URLs

```
DELETE zstack/v1/pci-device/pci-devices/{uuid}?deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth e48a9a18b86946af89ad991945942f6c" \
-X DELETE http://localhost:8080/zstack/v1/pci-device/pci-devices/
eae6d78d9ae344bab2c32028bea20f0?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.1
deleteMode	String	url	Optional. The delete mode.		2.1
systemTags	List	body	Optional. The system tags.		2.1
userTags	List	body	Optional. The user tags.		2.1

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DeletePciDeviceAction action = new DeletePciDeviceAction();
action.uuid = "435ae2ba1b3948a68835af0134ab8a97";
action.deleteMode = "Permissive";
action.sessionId = "c9e0d2c1a0614733854d12cb9670b475";
DeletePciDeviceAction.Result res = action.call();
```

Python SDK

```
DeletePciDeviceAction action = DeletePciDeviceAction()
action.uuid = "5ab09caf016345adad9ee77462da8acf"
action.deleteMode = "Permissive"
action.sessionId = "f048bfdfbdad403b9e2223a0d8b96bc6"
DeletePciDeviceAction.Result res = action.call()
```

5.2.3.42.4 GetPciDeviceCandidatesForAttachingVm

API Request

URLs

```
GET zstack/v1/vm-instances/{vmInstanceUuid}/candidate-pci-devices
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 3ac79a27693a48bda0c56e1a1ee3c4f6" \
-X GET http://localhost:8080/zstack/v1/vm-
instances/30f116d6602248249266776f279ef674/candidate-pci-devices
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vmInstanceUuid	String	url	The VM instance UUID.		2.1
systemTags	List	query	Optional. The system tags.		2.1

Name	Type	Location	Description	Optional Value	Starting Version
userTags	List	query	Optional. The user tags.		2.1

Java SDK

```
CreatePciDeviceOfferingAction action = new CreatePciDeviceOfferingAction();
action.name = "test";
action.vendorId = "10de";
action.deviceId = "0e0f";
action.sessionId = "0cb0086840314456812971957614aa63";
CreatePciDeviceOfferingAction.Result res = action.call();
```

Python SDK

```
CreatePciDeviceOfferingAction action = CreatePciDeviceOfferingAction()
```

```

action.name = "test"
action.vendorId = "10de"
action.deviceId = "0e0f"
action.sessionId = "b2dcf8abb771429f8f2484d0f4df428d"
CreatePciDeviceOfferingAction.Result res = action.call()

```

5.2.3.42.9 DeletePciDeviceOffering

API Request

URLs

```

DELETE zstack/v1/pci-device/pci-device-offerings/{uuid}?
deleteMode={deleteMode}

```

Headers

```

Authorization: OAuth the-session-uuid

```

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/pci-device/pci-device-
offerings/900f2eefdec630c68313eb025123375d?deleteMode=Permissive

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.1
deleteMode	String	url	Optional. The delete mode.		2.1
systemTags	List	body	Optional. The system tags.		2.1
userTags	List	body	Optional. The user tags.		2.1

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```

{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",

```

```

    "details": "Create VM on KVM timeout after 300s"
  }
}

```

SDK Sample

Java SDK

```

DeletePciDeviceOfferingAction action = new DeletePciDeviceOfferingAction();
action.uuid = "f47d555477e645af9a8817ce00b98b9d";
action.deleteMode = "Permissive";
action.sessionId = "c6809b8d823a4be484b82d03083a9ed0";
DeletePciDeviceOfferingAction.Result res = action.call();

```

Python SDK

```

DeletePciDeviceOfferingAction action = DeletePciDeviceOfferingAction()
action.uuid = "d5458c1007774c16aa0ae771056172ca"
action.deleteMode = "Permissive"
action.sessionId = "99e57c0e1caf44929feb35de6cd90605"
DeletePciDeviceOfferingAction.Result res = action.call()

```

5.2.3.42.10 QueryPciDeviceOffering

API Request

URLs

```

GET zstack/v1/pci-device/pci-device-offerings
GET zstack/v1/pci-device/pci-device-offerings/{uuid}

```

Headers

```

Authorization: OAuth the-session-uuid

```

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 0356dc4f75ac4798817b29d957ccb4bc" \
-X GET http://localhost:8080/zstack/v1/pci-device/pci-device-offerings

```

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 159ccf53b07a4b97ba3ea07dcf385f34" \
-X GET http://localhost:8080/zstack/v1/pci-device/pci-device-offerings/a43387ea19d84cecb328c34af59f6292

```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryPciDeviceOffering`, and pressing the **Tab** key.

Equal	PciDeviceMetadataOperator	The equal operator.	2.1
Unequal	PciDeviceMetadataOperator	The not equal operator.	2.1

#matchedPciDevices

Name	Type	Description	Starting Version
pciDeviceUuid	String		2.1
pciDeviceOfferingUuid	String		2.1

SDK Sample

Java SDK

```
QueryPciDeviceOfferingAction action = new QueryPciDeviceOfferingAction();
action.conditions = asList();
action.sessionId = "fa91fe0f572c4ac1bcc975572985eed9";
QueryPciDeviceOfferingAction.Result res = action.call();
```

Python SDK

```
QueryPciDeviceOfferingAction action = QueryPciDeviceOfferingAction()
action.conditions = []
action.sessionId = "c194660b515f48c98b469f591cdfe5a2"
```

```
QueryPciDeviceOfferingAction.Result res = action.call()
```

5.2.3.42.11 QueryPciDevicePciDeviceOffering

API Request

URLs

```
GET zstack/v1/pci-devices/pci-devices/pci-device-offerings
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b4f4b13d193c4db9890eb1e5e055341a" \
-X GET http://localhost:8080/zstack/v1/pci-devices/pci-devices/pci-device-offerings
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryPciDevicePciDeviceOffering`, and pressing the **Tab** key.

API Response

Sample Response

```
{
  "inventories": [
    {}
  ]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.1
inventories	List	See inventories .	2.1

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	2.1
description	String	The brief description of the error.	2.1
details	String	The details about the error.	2.1
elaboration	String	The reserved field. Default value: null.	2.1
opaque	LinkedHashMap	The reserved field. Default value: null.	2.1
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	2.1

#inventories

Name	Type	Description	Starting Version
pciDeviceUuid	String		2.1
pciDeviceOfferingUuid	String		2.1

SDK Sample

Java SDK

```
QueryPciDevicePciDeviceOfferingAction action = new QueryPciDevicePciDeviceOfferingAction();
action.conditions = asList();
action.sessionId = "31a0eed2b439493997c448262d1ebc38";
QueryPciDevicePciDeviceOfferingAction.Result res = action.call();
```

Python SDK

```
QueryPciDevicePciDeviceOfferingAction action = QueryPciDevicePciDeviceOfferingAction()
action.conditions = []
```

```
action.sessionId = "0dce1b66e4584dce83137f266aae1200"  
QueryPciDevicePciDeviceOfferingActionResult res = action.call()
```

5.2.3.42.12 GetHostlomuStatus

API Request

URLs

```
GET zstack/v1/pci-device/hosts/status/uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \  
-H "Authorization: OAuth 5dd20f6d5e414a15a8923f349758b5ff" \  
-X GET http://localhost:8080/zstack/v1/pci-device/hosts/status/uuid}?  
uuid=fcc8d4defb1e4064907636e7cf0ed885
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	query	The resource UUID.		2.1
systemTags	List	query	Optional. The system tags.		2.1
userTags	List	query	Optional. The user tags.		2.1

API Response

Sample Response

```
{  
  "status": "Active"  
}
```

Name	Type	Description	Starting Version
success	boolean		2.1
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For	2.1

Name	Type	Description	Starting Version
		more information, see error .	
status	HostIommuStatusType	See status .	2.1

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	2.1
description	String	The brief description of the error.	2.1
details	String	The details about the error.	2.1
elaboration	String	The reserved field. Default value: null.	2.1
opaque	LinkedHashMap	The reserved field. Default value: null.	2.1
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	2.1

#status

Name	Type	Description	Starting Version
name	String	The resource name.	2.1
ordinal	int		2.1

SDK Sample

Java SDK

```
GetHostIommuStatusAction action = new GetHostIommuStatusAction();
```

```
action.uuid = "78e175a479124efeb8182c00a854a05d";
action.sessionId = "8b8cba1389204acb8d56fbed1dad8458";
GetHostIommuStatusAction.Result res = action.call();
```

Python SDK

GetHostIommuStatusAction action = GetHostIommuStatusAction()
action.uuid = "7a446ba1cfe644f09fc454d7b32c6f4d"
action.sessionId = "c44236d523584717974407c5e972e7fc"
GetHostIommuStatusAction.Result res = action.call()
```

5.2.3.42.13 UpdateHostIommuState

API Request

URLs

```
PUT zstack/v1/pci-device/hosts/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateHostIommuState": {
    "state": "Enabled"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateHostIommuState":{"state":"Enabled"}}' \
http://localhost:8080/zstack/v1/pci-device/
hosts/7619742c9ff43b898487db33e1f096a4/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.1
state	String	body (contained in the updateHostlommelmuState structure)		• Enabled • Disabled	2.1
systemTags	List	body	Optional. The system tags.		2.1
userTags	List	body	Optional. The user tags.		2.1

API Response

Sample Response

```
{
  "state": "Enabled"
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.1
state	HostlommelmuStateType	See state .	2.1

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	2.1

Name	Type	Description	Starting Version
description	String	The brief description of the error.	2.1
details	String	The details about the error.	2.1
elaboration	String	The reserved field. Default value: null.	2.1
opaque	LinkedHashMap	The reserved field. Default value: null.	2.1
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	2.1

#state

Name	Type	Description	Starting Version
HostIommuState	String	The host IOMMU state, including: • Enabled • Disabled	2.1

SDK Sample

Java SDK

```
UpdateHostIommuStateAction action = new UpdateHostIommuStateAction();
action.uuid = "30bc8157b4894ceb9be0387248febb72";
action.state = "Enabled";
action.sessionId = "c06ce6f86c10486f891ec7aab3896865";
UpdateHostIommuStateAction.Result res = action.call();
```

Python SDK

```
UpdateHostIommuStateAction action = UpdateHostIommuStateAction()
action.uuid = "53ad6ee9424148e8894c305370a1a9ba"
action.state = "Enabled"
action.sessionId = "f04fcfb3bfe3438aa56dd43e87202f04"
```

```
UpdateHostIommuStateAction.Result res = action.call()
```

5.2.3.42.14 GetHostIommuState

API Request

URLs

```
GET zstack/v1/pci-device/hosts/state/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 637890e6fd754515a256c9c105d5c1c7" \
-X GET http://localhost:8080/zstack/v1/pci-device/hosts/
state/904c207877bd4c20a4fc6811ec8cd808
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.1
systemTags	List	query	Optional. The system tags.		2.1
userTags	List	query	Optional. The user tags.		2.1

API Response

Sample Response

```
{
  "state": "Enabled"
}
```

Name	Type	Description	Starting Version
success	boolean		2.1
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For	2.1

Name	Type	Description	Starting Version
		more information, see error .	
state	HostIommuStateType	See state .	2.1

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	2.1
description	String	The brief description of the error.	2.1

specs/ace129cb77d93012bf47f839b9429881/vm-
instances/16ecb900082437e8aaf554ce19620030
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
pciSpecUuid	String	url	The UUID of the PCI device specification.		3.5.0
vmInstanceUuid	String	url	The VM instance UUID.		3.5.0
pciDeviceNumber	Integer	body (contained in the params structure)	Optional. The number of PCI devices.		3.5.0
systemTags	List	body	Optional. The system tags.		3.5.0
userTags	List	body	Optional. The user tags.		3.5.0

API Response

Sample Response

```
{
  "inventory": {
    "vmInstanceUuid": "ed0836204dbd496bb9cfa25f091d9d4a",
    "pciSpecUuid": "f9e3605232d343d99bca77ba13c1ca34",
    "pciDeviceNumber": 1.0,
    "createDate": "Nov 14, 2017 10:20:57 PM",
    "lastOpDate": "Nov 14, 2017 10:20:57 PM"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.5.0
inventory	VmInstance PciDeviceSpecRefInventry	See inventory .	3.5.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	3.5.0
description	String	The brief description of the error.	3.5.0
details	String	The details about the error.	3.5.0
elaboration	String	The reserved field. Default value: null.	3.5.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.5.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.5.0

#inventory

Name	Type	Description	Starting Version
vmInstanceUuid	String	The VM instance UUID.	3.5.0
pciSpecUuid	String	The UUID of the PCI device specification.	3.5.0
pciDeviceNumber	Integer	The number of PCI devices to be attached to the VM instance . Note that these devices must conform to the PCI device specification. Default value: 1.	3.5.0
createDate	Timestamp	The creation date.	3.5.0

Name	Type	Description	Starting Version
lastOpDate	Timestamp	The last operation date.	3.5.0

SDK Sample

Java SDK

```
AddPciDeviceSpecToVmInstanceAction action = new AddPciDeviceSpecToVmInstanceAction();
action.pciSpecUuid = "ace129cb77d93012bf47f839b9429881";
action.vmInstanceUuid = "16ecb900082437e8aaf554ce19620030";
action.pciDeviceNumber = 1.0;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
AddPciDeviceSpecToVmInstanceAction.Result res = action.call();
```

Python SDK

```
AddPciDeviceSpecToVmInstanceAction action = AddPciDeviceSpecToVmInstanceAction()
action.pciSpecUuid = "ace129cb77d93012bf47f839b9429881"
action.vmInstanceUuid = "16ecb900082437e8aaf554ce19620030"
action.pciDeviceNumber = 1.0
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
AddPciDeviceSpecToVmInstanceAction.Result res = action.call()
```

5.2.3.42.16 RemovePciDeviceSpecFromVmInstance

API Request

URLs

```
DELETE zstack/v1/pci-device-specs/{pciSpecUuid}/vm-instances/{vmInstanceUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/pci-device-specs/1c8f91c1699c35bfbb1847d2c20f7371/vm-instances/422fe51c278930f085e1323b0e858e3f?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
pciSpecUuid	String	url	The UUID of the PCI device specification.		3.5.0
vmInstanceUuid	String	url	The VM instance UUID.		3.5.0
systemTags	List	body	Optional. The system tags.		3.5.0
userTags	List	body	Optional. The user tags.		3.5.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
RemovePciDeviceSpecFromVmInstanceAction action = new RemovePciDeviceSpecFromVmInstanceAction();
action.pciSpecUuid = "1c8f91c1699c35bfbb1847d2c20f7371";
action.vmInstanceUuid = "422fe51c278930f085e1323b0e858e3f";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
RemovePciDeviceSpecFromVmInstanceAction.Result res = action.call();
```

Python SDK

```
RemovePciDeviceSpecFromVmInstanceAction action = RemovePciDeviceSpecFromVmInstanceAction()
action.pciSpecUuid = "1c8f91c1699c35bfbb1847d2c20f7371"
action.vmInstanceUuid = "422fe51c278930f085e1323b0e858e3f"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```

5.2.3.42.18 GetPciDeviceSpecCandidates

API Request

URLs

```
GET zstack/v1/pci-device-specs/candidates
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Samuel

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/pci-device-specs/candidates?
clusterUuids=d3305a8348d937ba97d260fb0af0e87d&clusterUuids=4943e8ab691435f98f7d22
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
clusterUuids	List	query	Optional. The cluster UUID.		3.5.0
hostUuid	String	query	Optional. The host UUID.		3.5.0
vmInstance Uuid	String	query	Optional. The VM instance UUID.		3.5.0

Name	Type	Location	Description	Optional Value	Starting Version
vmInstance Uuids	List	query	Optional. The VM instance UUID list.		3.6.1
types	List	query	Optional. The PCI device types.		3.5.0
systemTags	List	query	Optional. The system tags.		3.5.0
userTags	List	query	Optional. The user tags.		3.5.0

API Response

QueryVmInstancePciDeviceSpecRefAction.Result res = action.call()
```

5.2.3.42.21 GenerateSriovPciDevices

API Request

URLs

```
PUT zstack/v1/pci-devices/{pciDeviceUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "generateSriovPciDevices": {
    "virtPartNum": 4.0
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"generateSriovPciDevices":{"virtPartNum":4.0}}' http://
localhost:8080/zstack/v1/pci-devices/ce07829a08273d129f3b9d11cdf830b9/
actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
pciDeviceUuid	String	url	The PCI device UUID.		3.5.0
virtPartNum	Integer	body (contained in the generateSr	The number of virtual functions.		3.5.0

Name	Type	Location	Description	Optional Value	Starting Version
		iovPciDevices structure)			
systemTags	List	body	Optional. The system tags.		3.5.0
userTags	List	body	Optional. The user tags.		3.5.0

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
GenerateSriovPciDevicesAction action = new GenerateSriovPciDevicesAction();
action.pciDeviceUuid = "ce07829a08273d129f3b9d11cdf830b9";
action.virtPartNum = 4.0;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GenerateSriovPciDevicesAction.Result res = action.call();
```

Python SDK

```
GenerateSriovPciDevicesAction action = GenerateSriovPciDevicesAction()
action.pciDeviceUuid = "ce07829a08273d129f3b9d11cdf830b9"
action.virtPartNum = 4.0
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
GenerateSriovPciDevicesAction.Result res = action.call()
```

5.2.3.42.22 UngenerateSriovPciDevices

API Request

URLs

```
PUT zstack/v1/pci-devices/{pciDeviceUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "ungenerateSriovPciDevices": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"ungenerateSriovPciDevices":{}}' http://
localhost:8080/zstack/v1/pci-devices/31f8b8c366c63901ac928106568eca85/
actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
pciDeviceUuid	String	url	The PCI device UUID.		3.5.0
systemTags	List	body	Optional. The system tags.		3.5.0
userTags	List	body	Optional. The user tags.		3.5.0

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
UngenerateSriovPciDevicesAction action = new UngenerateSriovPciDe
vicesAction();
action.pciDeviceUuid = "31f8b8c366c63901ac928106568eca85";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UngenerateSriovPciDevicesAction.Result res = action.call();
```

Python SDK

```
UngenerateSriovPciDevicesAction action = UngenerateSriovPciDe
vicesAction()
action.pciDeviceUuid = "31f8b8c366c63901ac928106568eca85"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UngenerateSriovPciDevicesAction.Result res = action.call()
```

5.2.3.42.23 GenerateMdevDevices

API Request

URLs

```
PUT zstack/v1/pci-devices/{pciDeviceUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "generateMdevDevices": {
    "mdevSpecUuid": "013f5f259daa3e119ec79496ed2f5697"
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"generateMdevDevices":
{"mdevSpecUuid": "013f5f259daa3e119ec79496ed2f5697"}}' http://
localhost:8080/zstack/v1/pci-devices/b5b60d1bc9353c948c635a500a044c97/
actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
pciDeviceUuid	String	url	The PCI device UUID.		3.5.0
mdevSpecUuid	String	body (contained in the generateMdevDevices structure)	The UUID of the MDEV device specification.		3.5.0
systemTags	List	body	Optional. The system tags.		3.5.0
userTags	List	body	Optional. The user tags.		3.5.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
GenerateMdevDevicesAction action = new GenerateMdevDevicesAction();
action.pciDeviceUuid = "b5b60d1bc9353c948c635a500a044c97";
action.mdevSpecUuid = "013f5f259daa3e119ec79496ed2f5697";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GenerateMdevDevicesAction.Result res = action.call();
```

Python SDK

```
GenerateMdevDevicesAction action = GenerateMdevDevicesAction()
action.pciDeviceUuid = "b5b60d1bc9353c948c635a500a044c97"
action.mdevSpecUuid = "013f5f259daa3e119ec79496ed2f5697"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GenerateMdevDevicesAction.Result res = action.call()
```

5.2.3.42.24 UngenerateMdevDevices

API Request

URLs

```
PUT zstack/v1/pci-devices/{pciDeviceUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "ungenerateMdevDevices": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X PUT -d '{"ungenerateMdevDevices":{}}' http://localhost:8080/zstack/v1/pci-devices/772a0f2d8aaa3626964e080122a48c25/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
pciDeviceUuid	String	url	The UUID of the PCI device from which the MDEV device is generated.		3.5.0
systemTags	List	body	Optional. The system tags.		3.5.0
userTags	List	body	Optional. The user tags.		3.5.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
UngenerateMdevDevicesAction action = new UngenerateMdevDevicesAction();
action.pciDeviceUuid = "772a0f2d8aaa3626964e080122a48c25";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UngenerateMdevDevicesAction.Result res = action.call();
```

Python SDK

```
UngenerateMdevDevicesAction action = UngenerateMdevDevicesAction()
action.pciDeviceUuid = "772a0f2d8aaa3626964e080122a48c25"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
UngenerateMdevDevicesAction.Result res = action.call()
```

5.2.3.42.25 QueryMdevDeviceSpec

API Request

URLs

```
GET zstack/v1/mdev-device-specs
```

```
GET zstack/v1/mdev-device-specs/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/mdev-device-specs?
q=uuid=80e1584c51673827abf32ad7c57fa5ed
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/mdev-device-
specs/21accb3c691435f4a453de1566f19a37
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryMdevDeviceSpec**, and pressing the **Tab** key.

API Response

Sample Response

```

Name	Type	Description	Starting Version
GPU_Video_Controller	MdevDeviceType	The GPU video controller.	3.5.0

#state

Name	Type	Description	Starting Version
Enabled	MdevDeviceSpecState	The MDEV device specification is enabled.	3.5.0
Disabled	MdevDeviceSpecState	The MDEV device specification is disabled.	3.5.0

SDK Sample

Java SDK

```
QueryMdevDeviceSpecAction action = new QueryMdevDeviceSpecAction();
action.conditions = asList("uuid=96eb790c250833cd8889736e712639d9");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryMdevDeviceSpecAction.Result res = action.call();
```

Python SDK

```
QueryMdevDeviceSpecAction action = QueryMdevDeviceSpecAction()
action.conditions = ["uuid=804f01b24a4f3ad6b78b09345e0ada3a"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
QueryMdevDeviceSpecAction.Result res = action.call()
```

5.2.3.42.26 AttachMdevDeviceToVm

API Request

URLs

```
POST zstack/v1/mdev-devices/{mdevDeviceUuid}/vm-instances/
{vmInstanceUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{}}' http://localhost:8080/zstack/v1/

Name	Type	Description	Starting Version
Active	MdevDeviceStatus	The MDEV device is active.	3.5.0
Attached	MdevDeviceStatus	The MDEV device is attached.	3.5.0

SDK Sample

Java SDK

```
GetMdevDeviceCandidatesAction action = new GetMdevDeviceCandidatesAction();
action.vmInstanceUuid = "3be91dd3332a3ef0b57831dcfc28a0c2";
action.types = asList("GPU_Video_Controller");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
GetMdevDeviceCandidatesAction.Result res = action.call();
```

Python SDK

```
GetMdevDeviceCandidatesAction action = GetMdevDeviceCandidatesAction()
action.vmInstanceUuid = "3be91dd3332a3ef0b57831dcfc28a0c2"
action.types = [GPU_Video_Controller]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetMdevDeviceCandidatesAction.Result res = action.call()
```

5.2.3.42.30 QueryMdevDevice

API Request

URLs

```
GET zstack/v1/mdev-devices
```

```
GET zstack/v1/mdev-devices/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/mdev-devices
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/mdev-devices/9fa9e261caad306f89ccde6f0dca7a1d
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryMdevDevice**, and pressing the **Tab** key.

API Response

QueryMdevDeviceAction action = QueryMdevDeviceAction()
action.conditions = []
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryMdevDeviceAction.Result res = action.call()
```

5.2.3.42.31 AddMdevDeviceSpecToVmInstance

API Request

URLs

```
POST zstack/v1/mdev-device-specs/{mdevSpecUuid}/vm-instances/
{vmInstanceUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "mdevDeviceNumber": 1.0
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"mdevDeviceNumber":1.0}}'
http://localhost:8080/zstack/v1/mdev-device-
specs/dbcfe5ae889933a2a740584935e63e72/vm-
instances/3d0b1d8b82ba3dd0b95a7903f735bdd1
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
mdevSpecUuid	String	url	The UUID of the MDEV device specification.		3.5.0
vmInstanceUuid	String	url	The VM instance UUID.		3.5.0
mdevDeviceNumber	Integer	body (contained in the params structure)	Optional. The number of MDEV devices.		3.5.0
systemTags	List	body	Optional. The system tags.		3.5.0
userTags	List	body	Optional. The user tags.		3.5.0

API Response

Sample Response

```
{
  "inventory": {

vmInstanceUuid	String	The VM instance UUID.	3.5.0

Name	Type	Description	Starting Version
mdevSpecUuid	String	The UUID of the MDEV device specification.	3.5.0
mdevDeviceNumber	Integer	The number of MDEV devices to be attached to the VM instance . Note that these devices must conform to the MDEV device specification. Default value: 1	3.5.0
createDate	Timestamp	The creation date.	3.5.0
lastOpDate	Timestamp	The last operation date.	3.5.0

SDK Sample

Java SDK

```
AddMdevDeviceSpecToVmInstanceAction action = new AddMdevDeviceSpecToVmInstanceAction();
action.mdevSpecUuid = "dbcfe5ae889933a2a740584935e63e72";
action.vmInstanceUuid = "3d0b1d8b82ba3dd0b95a7903f735bdd1";
action.mdevDeviceNumber = 1.0;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
AddMdevDeviceSpecToVmInstanceAction.Result res = action.call();
```

Python SDK

```
AddMdevDeviceSpecToVmInstanceAction action = AddMdevDeviceSpecToVmInstanceAction()
action.mdevSpecUuid = "dbcfe5ae889933a2a740584935e63e72"
action.vmInstanceUuid = "3d0b1d8b82ba3dd0b95a7903f735bdd1"
action.mdevDeviceNumber = 1.0
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
AddMdevDeviceSpecToVmInstanceAction.Result res = action.call()
```

5.2.3.42.32 RemoveMdevDeviceSpecFromVmInstance

API Request

URLs

```
DELETE zstack/v1/mdev-device-specs/{mdevSpecUuid}/vm-instances/
{vmInstanceUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/mdev-
device-specs/195f9b240d4a3f8b9946950694745fff/vm-
instances/76ce5da88e383ee983955f3a24aea5cf?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
mdevSpecUuid	String	url	The UUID of the MDEV device specification.		3.5.0
vmInstanceUuid	String	url	The VM instance UUID.		3.5.0
deleteMode	String	body	Optional. The delete mode. Options: Permissive Enforcing. Default mode: Permissive.		3.5.0
systemTags	List	body	Optional. The system tags.		3.5.0
userTags	List	body	Optional. The user tags.		3.5.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
RemoveMdevDeviceSpecFromVmInstanceAction action = new RemoveMdev
DeviceSpecFromVmInstanceAction();
action.mdevSpecUuid = "195f9b240d4a3f8b9946950694745fff";
action.vmInstanceUuid = "76ce5da88e383ee983955f3a24aea5cf";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
RemoveMdevDeviceSpecFromVmInstanceAction.Result res = action.call();
```

Python SDK

```
RemoveMdevDeviceSpecFromVmInstanceAction action = RemoveMdevDeviceSpec
FromVmInstanceAction()
action.mdevSpecUuid = "195f9b240d4a3f8b9946950694745fff"
action.vmInstanceUuid = "76ce5da88e383ee983955f3a24aea5cf"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
RemoveMdevDeviceSpecFromVmInstanceAction.Result res = action.call()
```

5.2.3.42.33 UpdateMdevDeviceSpec

API Request

URLs

```
PUT zstack/v1/mdev-device-specs/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateMdevDeviceSpec": {
    "name": "GRID_M60-2A",
    "description": "NVIDIA Corporation, GM204GL [Tesla M60], a1, VGA
compatible controller",
    "state": "Enabled"
  },
}
```

```
"systemTags": [],
"userTags": []
}
```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateMdevDeviceSpec":

    }
  ]
}

```

}

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.5.0
inventories	List	See inventories .	3.5.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.5.0
description	String	The brief description of the error.	3.5.0
details	String	The details about the error.	3.5.0
elaboration	String	The reserved field. Default value: null.	3.5.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.5.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.5.0

#inventories

Name	Type	Description	Starting Version
vmInstanceUuid	String	The VM instance UUID.	3.5.0

Name	Type	Description	Starting Version
mdevSpecUuid	String	The UUID of the MDEV device specification.	3.5.0
mdevDeviceNumber	Integer	The number of MDEV devices to be attached to the VM instance . Note that these devices must conform to the MDEV device specification. Default value: 1.	3.5.0
createDate	Timestamp	The creation date.	3.5.0
lastOpDate	Timestamp	The last operation date.	3.5.0

SDK Sample

Java SDK

```
QueryVmInstanceMdevDeviceSpecRefAction action = new QueryVmInstanceMdevDeviceSpecRefAction();
action.conditions = asList("vmInstanceUuid=308f8eccec9b320bbe082f233e7f822c");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryVmInstanceMdevDeviceSpecRefAction.Result res = action.call();
```

Python SDK

```
QueryVmInstanceMdevDeviceSpecRefAction action = QueryVmInstanceMdevDeviceSpecRefAction()
action.conditions = ["vmInstanceUuid=254f7f2f30bb3b7bb26595fc5120a63b"]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
QueryVmInstanceMdevDeviceSpecRefAction.Result res = action.call()
```

5.2.3.43 USB Redirection Operations

5.2.3.43.1 GetVmUsbRedirect

API Request

URLs

```
GET zstack/v1/vm-instances/{uuid}/usbredirect
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth bb5fd18e914f4bfd88032edd0ee7b975" \
-X GET http://localhost:8080/zstack/v1/vm-
instances/4b9d28c1d35f4f14b8ba1bb982500c50/usbredirect
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.1
systemTags	List	query	Optional. The system tags.		2.1
userTags	List	query	Optional. The user tags.		2.1

API Response

Sample Response

```
{
  "enable": true
}
```

Name	Type	Description	Starting Version
enable	boolean	If true, the USB redirection switch is enabled, or vice versa.	2.1

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.1

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	2.1
description	String	The brief description of the error.	2.1
details	String	The details about the error.	2.1
elaboration	String	The reserved field. Default value: null.	2.1
opaque	LinkedHashMap	The reserved field. Default value: null.	2.1
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	2.1

SDK Sample

Java SDK

```
GetVmUsbRedirectAction action = new GetVmUsbRedirectAction();
action.uuid = "c58671c58dd147e29d4bc263feafa04d";
action.sessionId = "e173648fdca94fd3ae720473a305ce4c";
```

```
GetVmUsbRedirectAction.Result res = action.call();
```

Python SDK

```
GetVmUsbRedirectAction action = GetVmUsbRedirectAction()
action.uuid = "08efac4de45a4f6789d1009afa9e295e"
action.sessionId = "3f5a7473758d4c8ab3cc4664461500a4"
GetVmUsbRedirectAction.Result res = action.call()
```

5.2.3.43.2 SetVmUsbRedirect

API Request

URLs

```
PUT zstack/v1/vm-instances/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "setVmUsbRedirect": {
    "enable": true
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"setVmUsbRedirect":{"enable":true}}' \
http://localhost:8080/zstack/v1/vm-instances/
ceeca8ab8c6b33fab9bdc143dec13211/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.1

Name	Type	Location	Description	Optional Value	Starting Version
enable	boolean	body (contained in the setVmUsbRedirect structure)	If true, the USB redirection switch is enabled, or vice versa.	• true • false	2.1
systemTags	List	body	Optional. The system tags.		2.1
userTags	List	body	Optional. The user tags.		2.1

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
SetVmUsbRedirectAction action = new SetVmUsbRedirectAction();
action.uuid = "8c14cf1dd17642c19622c924d065bb00";
action.enable = true;
action.sessionId = "6a5e2cc211794d28b9e1641c1a53d018";
SetVmUsbRedirectAction.Result res = action.call();
```

Python SDK

```
SetVmUsbRedirectAction action = SetVmUsbRedirectAction()
action.uuid = "977cd1ae8b5f4dcab4c5f2062089ebf9"
action.enable = true
action.sessionId = "e6b4af2b358b44ea9fc3ff185d9af869"
```

```
SetVmUsbRedirectAction.Result res = action.call()
```

5.2.3.44 USB Pass-through Operations

5.2.3.44.1 AttachUsbDeviceToVm

API Request

URLs

```
POST zstack/v1/usb-device/usb-devices/{usbDeviceUuid}/attach
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "vmInstanceUuid": "2a3697245a4a3e829a246e222c243688",
    "attachType": "PassThrough"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"vmInstanceUuid":"2a3697245a4a3e829a246e222c243688", "attachType":"PassThrough"}}'
http://localhost:8080/zstack/v1/usb-device/usb-devices/84838a1925bb3eb3b2440a8afd420e40/attach
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
usbDeviceUuid	String	url	The USB device UUID.		2.2

Name	Type	Location	Description	Optional Value	Starting Version
vmInstanceUuid	String	body (contained in the params structure)	The VM instance UUID.		2.2
attachType	String	body (contained in the params structure)	Optional. The attach type.	- PassThrough - Redirect	3.5.0
systemTags	List	body	Optional. The system tags.		2.2
userTags	List	body	Optional. The user tags.		2.2

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "dc782167a4853525848fd04bf606d072",
    "name": "usb",

SDK Sample

Java SDK

```
AttachUsbDeviceToVmAction action = new AttachUsbDeviceToVmAction();
action.usbDeviceUuid = "84838a1925bb3eb3b2440a8afd420e40";
action.vmInstanceUuid = "2a3697245a4a3e829a246e222c243688";
action.attachType = "PassThrough";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
AttachUsbDeviceToVmAction.Result res = action.call();
```

Python SDK

```
AttachUsbDeviceToVmAction action = AttachUsbDeviceToVmAction()
action.usbDeviceUuid = "84838a1925bb3eb3b2440a8afd420e40"
action.vmInstanceUuid = "2a3697245a4a3e829a246e222c243688"
action.attachType = "PassThrough"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
AttachUsbDeviceToVmAction.Result res = action.call()
```

5.2.3.44.2 DetachUsbDeviceFromVm

API Request

URLs

```
POST zstack/v1/usb-device/usb-devices/{usbDeviceUuid}/detach
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{}}' \
http://localhost:8080/zstack/v1/usb-device/usb-devices/17a5e98e5f943e8fafa01602d50cf3ad/detach
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
usbDeviceUuid	String	url	The USB device UUID.		2.2
systemTags	List	body	Optional. The system tags.		2.2
userTags	List	body	Optional. The user tags.		2.2

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DetachUsbDeviceFromVmAction action = new DetachUsbDeviceFromVmAction
();
action.usbDeviceUuid = "5256c889e9f0489e8fd12b66d176fb7d";
action.sessionId = "8082962f2d304a3fbee969e6b4749338";
DetachUsbDeviceFromVmAction.Result res = action.call();
```

Python SDK

```
DetachUsbDeviceFromVmAction action = DetachUsbDeviceFromVmAction()
action.usbDeviceUuid = "ced1bbb139c54d1d973ddc38ae565244"
action.sessionId = "f6550a168b9847fca4c98df088d86c09"
DetachUsbDeviceFromVmAction.Result res = action.call()
```

5.2.3.44.3 GetUsbDeviceCandidatesForAttachingVm

API Request

URLs

```
GET zstack/v1/vm-instances/{vmInstanceUuid}/candidate-usb-devices
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/vm-instances/
ab759c79169739cb9e13ff091c4fa386/candidate-usb-devices?
attachType=PassThrough
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vmInstanceUuid	String	url	The VM instance UUID.		2.2
attachType	String	query	Optional. The attach type.	- PassThrough - Redirect	3.6.0
systemTags	List	query	Optional. The system tags.		2.2
userTags	List	query	Optional. The user tags.		2.2

API Response

Sample Response

```

5.2.3.44.5 UpdateUsbDevice

API Request

URLs

```
PUT zstack/v1/usb-device/usb-devices/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```

{
  "updateUsbDevice": {
    "name": "usb",
    "description": "this is a usb device",
    "state": "Enabled"
  },
  "systemTags": [],
  "userTags": []
}

```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateUsbDevice":{"name":"usb","description":"this is a usb device","state":"Enabled"}}' \
http://localhost:8080/zstack/v1/usb-device/usb-devices/9d1ab4950ce933edabbaf8e73ca7e879/actions

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		2.2

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the updateUsbDevice structure)	Optional. The resource name.		2.2
description	String	body (contained in the updateUsbDevice structure)	Optional. The detailed description of the resource.		2.2
state	String	body (contained in the updateUsbDevice structure)	Optional. The USB state.	• Enabled • Disabled	2.2
systemTags	List	body	Optional. The system tags.		2.2
userTags	List	body	Optional. The user tags.		2.2

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "2695f7ce0bda4587bbabbbfaad080554",
    "description": "test usb",
    "hostUuid": "4261ceb358ce473fa62c137c1ba8d3ef",
    "vmInstanceUuid": "4c059c5e0a834d86984d3141d8ec42cb",
    "state": "Disabled",
    "idVendor": "10de",
    "idProduct": "0e0f",
    "iManufacturer": "SanDisk",
    "iProduct": "USB Storage",
    "iSerial": "0000000000001",
    "usbVersion": "3.0",
    "attachType": "PassThrough"
  }
}
```

}

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.2
inventory	UsbDeviceInventory	See inventory .	2.2

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	2.2
description	String	The brief description of the error.	2.2
details	String	The details about the error.	2.2
elaboration	String	The reserved field. Default value: null.	2.2
opaque	LinkedHashMap	The reserved field. Default value: null.	2.2
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	2.2

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	2.2
name	String	The resource name.	2.2

Name	Type	Description	Starting Version
description	String	The detailed description of the resource.	2.2
hostUuid	String	The host UUID.	2.2
vmInstanceUuid	String	The VM instance UUID.	2.2
busNum	String	The bus No.	2.2
devNum	String	The device No.	2.2
idVendor	String	The vendor ID.	2.2
idProduct	String	The device ID.	2.2
iManufacturer	String	The manufacturer.	2.2
iProduct	String	The device type.	2.2
iSerial	String	The serial No.	2.2
usbVersion	String	The USB version.	2.2
attachType	String	The attach type.	3.6.0
createDate	Timestamp	The creation date.	2.2
lastOpDate	Timestamp	The last operation date.	2.2
state	UsbDeviceState	See state .	2.2

#state

Name	Type	Description	Starting Version
name	String	The resource name.	2.2
ordinal	int		2.2

SDK Sample

Java SDK

```
UpdateUsbDeviceAction action = new UpdateUsbDeviceAction();
action.uuid = "86d05b807cfa47a7969745f0ffe8ee4b";
action.name = "usb";
action.description = "this is a usb device";
action.state = "Enabled";
action.sessionId = "86600ceaed5642ad810828129fe0e4a0";
```

```
UpdateUsbDeviceAction.Result res = action.call();
```

Python SDK

```
UpdateUsbDeviceAction action = UpdateUsbDeviceAction()
action.uuid = "f16940abc205404bb17b00367f5b6a8d"
action.name = "usb"
action.description = "this is a usb device"
action.state = "Enabled"
action.sessionId = "a65b10bd9a164d33a42d8bacfab5acd6"
UpdateUsbDeviceAction.Result res = action.call()
```

5.2.3.45 SR-IOV Operations

5.2.3.45.1 IsVfNicAvailableInL3Network

API Request

URLs

```
GET zstack/v1/l3-networks/{l3NetworkUuid}/hosts/{hostUuid}/
vfnicavailable
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/l3-
networks/443e156ec6883356974f97f803187310/
hosts/037404d26b033e9d9fe0d3e7e4bbaa8b/vfnicavailable
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
l3NetworkUuid	String	url	The L3 network UUID.		3.9.0
hostUuid	String	url	The host UUID.		3.9.0
systemTags	List	query	Optional. The system tags.		3.9.0
userTags	List	query	Optional. The user tags.		3.9.0

API Response

Sample Response

```
{
  "vfnicAvailable": true
}
```

Name	Type	Description	Starting Version
vfnicAvailable	boolean	Whether a virtual function (VF) NIC is available.	3.9.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.9.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.9.0
description	String	The brief description of the error.	3.9.0
details	String	The details about the error.	3.9.0
elaboration	String	The reserved field. Default value: null.	3.9.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.9.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.9.0

SDK Sample

Java SDK

```
IsVfNicAvailableInL3NetworkAction action = new IsVfNicAvailableInL3NetworkAction();
action.l3NetworkUuid = "443e156ec6883356974f97f803187310";
action.hostUuid = "037404d26b033e9d9fe0d3e7e4bbaa8b";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
IsVfNicAvailableInL3NetworkAction.Result res = action.call();
```

Python SDK

```
IsVfNicAvailableInL3NetworkAction action = IsVfNicAvailableInL3NetworkAction()
action.l3NetworkUuid = "443e156ec6883356974f97f803187310"
action.hostUuid = "037404d26b033e9d9fe0d3e7e4bbaa8b"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
IsVfNicAvailableInL3NetworkAction.Result res = action.call()
```

5.2.3.45.2 ChangeVmNicType

API Request

URLs

```
PUT zstack/v1/vm-instances/nics/{vmNicUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeVmNicType": {
    "vmNicType": "VNIC"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X PUT -d '{"changeVmNicType":{"vmNicType":"VNIC"}}'
http://localhost:8080/zstack/v1/vm-instances/nics/
ba83aa15bafd33e792267c428465b1e5/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vmNicUuid	String	url	The VM NIC UUID.		3.9.0
vmNicType	String	body (contained in the changeVmNicType structure)	The VM NIC type.	VNIC	3.9.0
systemTags	List	body	Optional. The system tags.		3.9.0
userTags	List	body	Optional. The user tags.		3.9.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "bd44ea50e2573d5d9249c938dba0dad6",
    "vmInstanceUuid": "1311eba1f7e53c3aa816a140fd783068",
    "usedIpUuid": "464575b453d53e60941c7eeee08f3149",
    "l3NetworkUuid": "b62214c53fde3f6eb825bf2ce59e3d2e",
    "ip": "192.168.1.10",
    "mac": "00:0c:29:bd:99:fc",
    "hypervisorType": "KVM",
    "netmask": "255.255.255.0",
    "gateway": "192.168.1.1",
    "deviceId": 0.0,
    "type": "VF"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	3.9.0

Name	Type	Description	Starting Version
inventory	VmNicInventory	See inventory .	3.9.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	3.9.0
description	String	The brief description of the error.	3.9.0
details	String	The details about the error.	3.9.0
elaboration	String	The reserved field. Default value: null.	3.9.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.9.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.9.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.9.0
vmInstanceUuid	String	The VM instance UUID.	3.9.0
l3NetworkUuid	String	The L3 network UUID.	3.9.0
ip	String	The IP address.	3.9.0
mac	String	The MAC address.	3.9.0
hypervisorType	String	The hypervisor type.	3.9.0

Name	Type	Description	Starting Version
netmask	String	The netmask.	3.9.0
gateway	String	The gateway.	3.9.0
metaData	String		3.9.0
ipVersion	Integer	The IP version.	3.9.0
deviceId	Integer	The device ID.	3.9.0
type	String	The NIC type.	3.9.0
createDate	Timestamp	The creation date.	3.9.0
lastOpDate	Timestamp	The last operation date.	3.9.0
usedIps	List	See usedIps .	3.9.0

#usedIps

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	3.9.0
ipRangeUuid	String	The IP range UUID.	3.9.0
l3NetworkUuid	String	The L3 network UUID.	3.9.0
ipVersion	Integer	The IP version.	3.9.0
ip	String	The IP address.	3.9.0
netmask	String	The netmask.	3.9.0
gateway	String	The gateway.	3.9.0
usedFor	String		3.9.0
ipInLong	long		3.9.0
vmNicUuid	String	The VM NIC UUID.	3.9.0
createDate	Timestamp	The creation date.	3.9.0
lastOpDate	Timestamp	The last operation date.	3.9.0

SDK Sample

Java SDK

```
ChangeVmNicTypeAction action = new ChangeVmNicTypeAction();
action.vmNicUuid = "ba83aa15bafd33e792267c428465b1e5";
```

```
action.vmNicType = "VNIC";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
ChangeVmNicTypeAction.Result res = action.call();
```

Python SDK

```
ChangeVmNicTypeAction action = ChangeVmNicTypeAction()
action.vmNicUuid = "ba83aa15bafd33e792267c428465b1e5"
action.vmNicType = "VNIC"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
ChangeVmNicTypeAction.Result res = action.call()
```

5.2.3.45.3 ChangeVfNicHaState

API Request

URLs

```
PUT zstack/v1/vm-instances/nics/{vfNicUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeVfNicHaState": {
    "haState": "Enabled"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8"
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c"
-X PUT -d '{"changeVfNicHaState":{"haState":"Enabled"}}'
http://localhost:8080/zstack/v1/vm-instances/
nics/8536b111015d3fd289907c5f53c80153/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vfNicUuid	String	url	VfNic UUID		5.1.0
haState	String	body (contained in the changeVfNicHaState structure)	Ha state.		5.1.0
systemTags	List	body	Optional. The system tags.		5.1.0
userTags	List	body	Optional. The user tags.		5.1.0

API Response

Sample Response

```
{
  "inventory": {
    "pciDeviceUuid": "4935759d5e543ff7bb9901262d67e805",
    "haState": "Enabled",
    "uuid": "5a39466d15e9303d8cd091be8f8b98a0",

cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	5.3.20

SDK Sample

Java SDK

```
GetVfPciDeviceAvailableInL2NetworkAction action = new GetVfPciDeviceAvailableInL2NetworkAction();
action.l2NetworkUuids = asList("7615ff44c9f03400b32b9138e1d332fc");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetVfPciDeviceAvailableInL2NetworkAction.Result res = action.call();
```

Python SDK

```
GetVfPciDeviceAvailableInL2NetworkAction action = GetVfPciDeviceAvailableInL2NetworkAction()
action.l2NetworkUuids = [7615ff44c9f03400b32b9138e1d332fc]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetVfPciDeviceAvailableInL2NetworkAction.Result res = action.call()
```

5.2.3.46 SE Operations

5.2.3.46.1 GenerateSeMdevDevices

API Request

URLs

```
PUT zstack/v1/mtty-devices/{mttyDeviceUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "generateSeMdevDevices": {
    "virtPartNum": 4.0
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"generateSeMdevDevices":{"virtPartNum":4.0}}'
http://localhost:8080/zstack/v1/mtty-devices/
d6e129976ad830fdbd2361a62f9f44e0/actions
```

Request Parameters

Name	Type	Location	Description	Valid Values	Starting Version
mttyDevice Uuid	String	url	The MTTY UUID.		4.6.0
virtPartNum	Integer	body(contained in the generateSeMdevDevices structure)	The division parts number.		4.6.0
systemTags	List	body	Optional. The system tags.		4.6.0
userTags (可选)	List	body	The user tags.		4.6.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
GenerateSeMdevDevicesAction action = new GenerateSeMdevDevicesAction();
action.mttyDeviceUuid = "d6e129976ad830fdbd2361a62f9f44e0";
action.virtPartNum = 4.0;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GenerateSeMdevDevicesAction.Result res = action.call();
```

Python SDK

```
GenerateSeMdevDevicesAction action = GenerateSeMdevDevicesAction()
action.mttyDeviceUuid = "d6e129976ad830fdbd2361a62f9f44e0"
action.virtPartNum = 4.0
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GenerateSeMdevDevicesAction.Result res = action.call()
```

5.2.3.46.2 QueryMttyDevice

API Request

URLs

```
GET zstack/v1/mtty-devices
```

```
GET zstack/v1/mtty-devices/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/mtty-devices
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/mtty-devices/
af9814346f623e61a86a603854231eac
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using zstack, entering **QueryMttyDevice**, and pressing the **Tab** key.

API Response

Sample Response

```
{

#state

Name	Type	Description	Starting Version
Enabled	MttyDeviceState	The enabled state.	4.6.0
Disabled	MttyDeviceState	The disabled state.	4.6.0

#virtStatus

Name	Type	Description	Starting Version
VFIO_MDEV_VIRTUALIZABLE	MttyDeviceVirtStatus	Support the VFIO_MDEV virtualization.	4.6.0
VFIO_MDEV_VIRTUALIZED	MttyDeviceVirtStatus	Virtualized by VFIO_MDEV.	4.6.0

Name	Type	Description	Starting Version
UNVIRTUALIZABLE	MttyDeviceVirtStatus	Cannot be virtualized.	4.6.0
UNKNOWN	MttyDeviceVirtStatus	Unknown.	4.6.0

SDK Sample

Java SDK

```
QueryHostNetworkInterfaceAction action = new QueryHostNetworkInterfaceAction();
action.conditions = asList();
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryHostNetworkInterfaceAction.Result res = action.call();
```

Python SDK

```
QueryHostNetworkInterfaceAction action = QueryHostNetworkInterfaceAction()
action.conditions = []
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryHostNetworkInterfaceAction.Result res = action.call()
```

5.2.3.46.3 UngenerateSeMdevDevices

API Request

URLs

```
PUT zstack/v1/mtty-devices/{mttyDeviceUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "ungenerateSeMdevDevices": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
```

```
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \  
-X PUT -d '{"ungenerateSeMdevDevices":{}}' http://  
localhost:8080/zstack/v1/mtty-  
devices/1efca0f4fb223cbd83e5d225d0c97637/actions
```

Request Parameters

Name	Type	Location	Description	Valid Values	Starting Version
mttyDevice Uuid	String	url	The UUID of the devided MTTY device.		4.6.0
systemTags	List	body	Optional. The system tags.		4.6.0
userTags	List	body	Optional. The user tags.		4.6.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{  
  "error": {  
    "code": "SYS.1001",  
    "description": "A message or a operation timeout",  
    "details": "Create VM on KVM timeout after 300s"  
  }  
}
```

SDK Sample

Java SDK

```
UngenerateSeMdevDevicesAction action = new UngenerateSeMdevDevi  
cesAction();  
action.mttyDeviceUuid = "1efca0f4fb223cbd83e5d225d0c97637";  
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";  
UngenerateSeMdevDevicesAction.Result res = action.call();
```

Python SDK

```
UngenerateSeMdevDevicesAction action = UngenerateSeMdevDevicesAction()  
action.mttyDeviceUuid = "1efca0f4fb223cbd83e5d225d0c97637"  
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
UngenerateSeMdevDevicesAction.Result res = action.call()
```

5.2.3.46.4 DeleteMdevDevice

API Request

URLs

```
Delete zstack/v1/mdev-device/{mdevDeviceUuid}?uuid={uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/mdev-devices/
f858a5a7428935b39aa038b6d781efdb
```

Request Parameters

Name	Type	Location	Description	Valid Values	Starting Version
uuid	String	url	The UUID of the MDEV device.		4.6.0
deleteMode	String	body	Optional. The deletion mode.		4.6.0
systemTags	List	body	Optional. The system tags.		4.6.0
userTags	List	body	Optional. The user tags.		4.6.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
DeleteMdevDeviceAction action = new DeleteMdevDeviceAction();
action.mdevDeviceUuid = "f858a5a7428935b39aa038b6d781efdb";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteMdevDeviceAction.Result res = action.call();
```

Python SDK

```
DeleteMdevDeviceAction action = DeleteMdevDeviceAction()
action.mdevDeviceUuid = "f858a5a7428935b39aa038b6d781efdb"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteMdevDeviceAction.Result res = action.call()
```

5.2.4 GPU Device Operations

5.2.4.1 QueryGpuDevice

API Request

URLs

```
GET zstack/v1/gpu-device/gpu-devices
```

```
GET zstack/v1/gpu-device/gpu-devices/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl示例

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/gpu-device/gpu-devices?
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/gpu-device/gpu-devices/
36fd4a643a173c36a45bfa3a1761c567
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryGpuDevice`, and pressing the **Tab** key.

API Response

SDK Sample

Java SDK

```
QueryGpuDeviceAction action = new QueryGpuDeviceAction();
action.conditions = asList();
action.sessionId = "b86c9016b4f24953a9edfb53ca0678c";
```

```
QueryGpuDeviceAction.Result res = action.call();
```

Python SDK

```
QueryGpuDeviceAction action = QueryGpuDeviceAction()  
action.conditions = []  
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"  
QueryGpuDeviceAction.Result res = action.call()
```

5.2.5 Primary Storage Operations

5.2.5.1 DeletePrimaryStorage

API Request

URLs

```
DELETE zstack/v1/primary-storage/{uuid}?deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \  
-H "Authorization: OAuth af6279db8d5d4434afe789fdb214fe86" \  
-X DELETE http://localhost:8080/zstack/v1/primary-  
storage/84ecb184e2f649ac9300f804dfd9f43e?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The primary storage UUID.		0.6
deleteMode	String	body	Optional. The delete mode . Options: Permissive Enforcing. Default mode: Permissive.		0.6
systemTags	List	body	Optional. The system tags.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeletePrimaryStorageAction action = new DeletePrimaryStorageAction();
action.uuid = "c471a57db90945129303e69cf731fee3";
action.deleteMode = "Permissive";
action.sessionId = "34041f0d587e4ce1827dd88f34a0a94b";
DeletePrimaryStorageAction.Result res = action.call();
```

Python SDK

```
DeletePrimaryStorageAction action = DeletePrimaryStorageAction()
action.uuid = "309a9da1c0884e679dd7f96502130ce3"
action.deleteMode = "Permissive"
action.sessionId = "0aa8b461719c45eea867c0be49565489"
```

```
DeletePrimaryStorageAction.Result res = action.call()
```

5.2.5.2 QueryPrimaryStorage

API Request

URLs

```
GET zstack/v1/primary-storage
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth f889c6a0220c4b34b3007f72bd04e839" \

    "type": "LocalStorage",
    "state": "Enabled",
    "status": "Connected"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventory	PrimaryStorageInventory	See inventory .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6

Name	Type	Description	Starting Version
description	String	The detailed description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
zoneUuid	String	The zone UUID.	0.6
name	String	The resource name.	0.6
url	String		0.6
description	String	The detailed description of the resource.	0.6
totalCapacity	Long		0.6
availableCapacity	Long		0.6
totalPhysicalCapacity	Long		0.6
availablePhysicalCapacity	Long		0.6
systemUsedCapacity	Long		0.6
type	String		0.6
state	String		0.6
status	String		0.6
mountPath	String		0.6

Name	Type	Description	Starting Version
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6
attachedClusterUuids	List		0.6

SDK Sample

Java SDK

```
DetachPrimaryStorageFromClusterAction action = new DetachPrimaryStorageFromClusterAction();
action.primaryStorageUuid = "c3444a3237a84d7e904b23d25106855a";
action.clusterUuid = "7ff9675810c84884984ee771d5a5b05c";
action.sessionId = "e678af3ed83b4ba893e0e514d2c07eb5";
DetachPrimaryStorageFromClusterAction.Result res = action.call();
```

Python SDK

```
DetachPrimaryStorageFromClusterAction action = DetachPrimaryStorageFromClusterAction()
action.primaryStorageUuid = "4dbcd51ef01c44728b19c4d5aa06ac59"
action.clusterUuid = "554ac500d71b476e91ecf5440980aba9"
action.sessionId = "21fdcfe391a14d46ad5a7dccc3ddfa"
DetachPrimaryStorageFromClusterAction.Result res = action.call()
```

5.2.5.5 ReconnectPrimaryStorage

API Request

URLs

```
PUT zstack/v1/primary-storage/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "reconnectPrimaryStorage": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"reconnectPrimaryStorage":{}}' \
http://localhost:8080/zstack/v1/primary-storage/699940f430123e588f4669ad7c17cf65/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The primary storage UUID.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {
    "name": "PS1",
    "url": "/Cloud_ps",
    "type": "LocalStorage",
    "state": "Enabled",
    "status": "Connected",
    "attachedClusterUuids": [
      "830a084ef24849cb8e65ffccb1e20e03"
    ]
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventory	PrimaryStorageInventory	See inventory .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
zoneUuid	String	The zone UUID.	0.6
name	String	The resource name.	0.6
url	String		0.6
description	String	The detailed description of the resource.	0.6
totalCapacity	Long		0.6
availableCapacity	Long		0.6
totalPhysicalCapacity	Long		0.6

Name	Type	Description	Starting Version

type	String		0.6
state	String		0.6
status	String		0.6
mountPath	String		0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6
attachedClusterUuids	List		0.6

SDK Sample

Java SDK

```
ReconnectPrimaryStorageAction action = new ReconnectPrimaryStorageAction();
action.uuid = "b346884f494b41d382e6fc3c1c6d406d";
action.sessionId = "634bb3b8568a4ee1b6f2abd3fc6edf65";
ReconnectPrimaryStorageAction.Result res = action.call();
```

Python SDK

```
ReconnectPrimaryStorageAction action = ReconnectPrimaryStorageAction()
action.uuid = "78b0b8b7ac4f4c3887ee71f0bd159012"
action.sessionId = "97ce6c4f337d458ba25b9c4b1308fc1f"
ReconnectPrimaryStorageAction.Result res = action.call()
```

5.2.5.6 GetPrimaryStorageCapacity

API Request

URLs

```
GET zstack/v1/primary-storage/capacities
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
```

```
-H "Authorization: OAuth 68c022afb7f74007980cf23a76fd2fd0" \
-X GET http://localhost:8080/zstack/v1/primary-storage/capacities?
primaryStorageUids=c8fd0638491c4c4ea70762c51d8445b5&all=false
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
zoneUids	List	query	Optional. The zone UUID list.		0.6
clusterUids	List	query	Optional. The cluster UUID list.		0.6
primaryStorageUids	List	query	Optional. The primary storage UUID list.		0.6
all	boolean	query	Optional. When the primary storage UUID list is null, the field is true, which means that all primary storages in the system will be queried.		0.6
systemTags	List	query	Optional. The system tags.		0.6
userTags	List	query	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "totalCapacity": 1.073741824E9,
  "availableCapacity": 9.73078528E8,
  "totalPhysicalCapacity": 1.073741824E9,
  "availablePhysicalCapacity": 9.73078528E8
}
```

}

Name	Type	Description	Starting Version
totalCapacity	long		0.6
availableCapacity	long		0.6
totalPhysicalCapacity	long		0.6
availablePhysicalCapacity	long		0.6
success	boolean		0.6
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

SDK Sample

Java SDK

```
GetPrimaryStorageCapacityAction action = new GetPrimaryStorageCapacityAction();
action.primaryStorageUuids = asList("9e151bee519044c0b19bdfc12d8d24ab");
action.all = false;
action.sessionId = "79627053d567472eaed5de6b16fcdb91";
GetPrimaryStorageCapacityAction.Result res = action.call();
```

Python SDK

```
GetPrimaryStorageCapacityAction action = GetPrimaryStorageCapacityAction()
action.primaryStorageUuids = [f78f7e2087ff437da395fb308db84300]
action.all = false
action.sessionId = "112ffe3fbad14be49c896feb9076dc10"
GetPrimaryStorageCapacityAction.Result res = action.call()
```

5.2.5.7 SyncPrimaryStorageCapacity

API Request

URLs

```
PUT zstack/v1/primary-storage/{primaryStorageUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "syncPrimaryStorageCapacity": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"syncPrimaryStorageCapacity":{}}' \
```

```
http://localhost:8080/zstack/v1/primary-storage/36ad940fe805304b85ca8af209b044b5/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
primaryStorageUuid	String	url	The primary storage UUID.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {
    "name": "PS1",
    "url": "/Cloud_ps",
    "availableCapacity": 9.73078528E8,
    "availablePhysicalCapacity": 9.73078528E8,
    "type": "LocalStorage",
    "state": "Enabled",
    "status": "Connected",
    "attachedClusterUuids": [
      "06b22ab47bb74d2d97dba43ccdde8b9a"
    ]
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventory	PrimaryStorageInventory	See inventory .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	0.6
description	String	The detailed description of the resource.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
zoneUuid	String	The zone UUID.	0.6
name	String	The resource name.	0.6
url	String		0.6
description	String	The detailed description of the resource.	0.6

systemUsedCapacity	Long		0.6
type	String		0.6
state	String		0.6
status	String		0.6
mountPath	String		0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6
attachedClusterUuids	List		0.6

SDK Sample

Java SDK

```
SyncPrimaryStorageCapacityAction action = new SyncPrimaryStorageCapacityAction();
action.primaryStorageUuid = "42508a6db24968b4fd7c7a1f4f6859";
action.sessionId = "bd1b393d64bd424c848cc2760c7aef0f";
SyncPrimaryStorageCapacityAction.Result res = action.call();
```

Python SDK

```
SyncPrimaryStorageCapacityAction action = SyncPrimaryStorageCapacityAction()
action.primaryStorageUuid = "695578d15cc04f2a84585deab75d29c7"
action.sessionId = "fdead04edbc741f99c826afc6db003a9"
SyncPrimaryStorageCapacityAction.Result res = action.call()
```

5.2.5.8 ChangePrimaryStorageState

API Request

URLs

```
PUT zstack/v1/primary-storage/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changePrimaryStorageState": {
    "stateEvent": "Disabled"
  }
}
```

```

    },
    "systemTags": [],
    "userTags": []
  }

```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"changePrimaryStorageState":{"stateEvent":"disable"}}' \
http://localhost:8080/zstack/v1/primary-storage/2e9c3a048ce03f5db297da323061a0de/actions

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The primary storage UUID.		0.6
stateEvent	String	body (contained in the changePrimaryStorageState structure)	The target state of the primary storage.	• enable • disable • maintain • deleting	0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response**Sample Response**

```

{
  "inventory": {
    "name": "PS1",
    "url": "/Cloud_ps",
    "type": "LocalStorage",
    "state": "Disabled",
    "attachedClusterUuids": [
      "408395dfdebb427e9453048436556a66"
    ]
  }
}

```

```

    }
  }
}

```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventory	PrimaryStorageInventory	See inventory .	0.6

#error

Name	Type	Description	Starting Version

```

5.2.5.9 UpdatePrimaryStorage

API Request

URLs

```
PUT zstack/v1/primary-storage/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updatePrimaryStorage": {
    "name": "New PS1"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updatePrimaryStorage":{"name":"New PS1"}}' \
http://localhost:8080/zstack/v1/primary-storage/1ed3e2350ff736918ac97c2a4d7d2f6e/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The primary storage UUID.		0.6
name	String	body (contained in the updatePrim	Optional. The new name of the primary storage.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
		aryStorage structure)			
description	String	body (contained in the updatePrimaryStorage structure)	Optional. The new description of the primary storage.		0.6
url	String	body (contained in the updatePrimaryStorage structure)	Optional. The new URL of the primary storage.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {
    "name": "New PS1",
    "url": "/Cloud_ps",
    "type": "LocalStorage",
    "state": "Enabled",
    "status": "Connected",

SDK Sample

Java SDK

```
UpdatePrimaryStorageAction action = new UpdatePrimaryStorageAction();
action.uuid = "7253221c336c4510b97607943f3b1a3c";
action.name = "New PS1";
action.sessionId = "0f4cfa5daeb2408da149a88d99c90df4";
UpdatePrimaryStorageAction.Result res = action.call();
```

Python SDK

```
UpdatePrimaryStorageAction action = UpdatePrimaryStorageAction()
action.uuid = "e75ab68c9201465496fb27c9f6ff234b"
action.name = "New PS1"
action.sessionId = "b18ea5e60dcc445abfb3ffa28761c77e"
```

```
UpdatePrimaryStorageAction.Result res = action.call()
```

5.2.5.10 CleanUpImageCacheOnPrimaryStorage

API Request

URLs

```
PUT zstack/v1/primary-storage/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "cleanUpImageCacheOnPrimaryStorage": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"cleanUpImageCacheOnPrimaryStorage":{}}' \
http://localhost:8080/zstack/v1/primary-storage/06e884ad8dbf3ed0bb061f4645b17075/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The primary storage UUID.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
CleanUpImageCacheOnPrimaryStorageAction action = new CleanUpImageCacheOnPrimaryStorageAction();
action.uuid = "cb50319265d540e19cbf98137fcbca0e";
action.sessionId = "5dc546cb18cc46b885412564a39c512f";
CleanUpImageCacheOnPrimaryStorageAction.Result res = action.call();
```

Python SDK

```
CleanUpImageCacheOnPrimaryStorageAction action = CleanUpImageCacheOnPrimaryStorageAction()
action.uuid = "cd35f62a64cd4daf9397f2e3bf5e910b"
action.sessionId = "e3ef197e97264195903b0fbdf52ae4c7"
CleanUpImageCacheOnPrimaryStorageAction.Result res = action.call()
```

5.2.5.11 CleanUpStorageTrashOnPrimaryStorage

API Request

URLs

```
PUT zstack/v1/primary-storage/{uuid}/storagetrash/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "cleanUpStorageTrashOnPrimaryStorage": {
    "force": false
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"cleanUpStorageTrashOnPrimaryStorage":{"force":false}}' \
http://localhost:8080/zstack/v1/primary-storage/238259a845cb344bbb5ad7013f91d644/storagetrash/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The primary storage UUID.		4.8.0
force	boolean	body (contained in the cleanUpStorageTrashOnPrimaryStorage structure)	Whether or not to force the primary storage to be cleaned.		4.8.0
systemTags	List	body	Optional. The system tags.		4.8.0
userTags	List	body	Optional. The user tags.		4.8.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "result": {
    "pool-2": [

Name	Type	Description	Starting Version
success	boolean		4.8.0
result	Map	The collection of successfully cleaned primary storage.	4.8.0
total	Integer	The number of successfully cleaned primary storage.	4.8.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.8.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.8.0
description	String	The brief description of the error.	4.8.0
details	String	The details about the error.	4.8.0
elaboration	String	The reserved field. Default value: null.	4.8.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.8.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error	4.8.0

Name	Type	Description	Starting Version
		exists, this parameter is null.	

SDK Sample

Java SDK

```
CleanUpStorageTrashOnPrimaryStorageAction action = new CleanUpStorageTrashOnPrimaryStorageAction();
action.uuid = "238259a845cb344bbb5ad7013f91d644";
action.force = false;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CleanUpStorageTrashOnPrimaryStorageAction.Result res = action.call();
```

Python SDK

```
CleanUpStorageTrashOnPrimaryStorageAction action = CleanUpStorageTrashOnPrimaryStorageAction()
action.uuid = "238259a845cb344bbb5ad7013f91d644"
action.force = false
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CleanUpStorageTrashOnPrimaryStorageAction.Result res = action.call()
```

5.2.5.12 GetPrimaryStorageAllocatorStrategies

API Request

URLs

```
GET zstack/v1/primary-storage/allocators/strategies
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth c74da723ad8b47d387c211a4fcbc0697" \
-X GET http://localhost:8080/zstack/v1/primary-storage/allocators/strategies
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	query	Optional. The system tags.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
userTags	List	query	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "primaryStorageAllocatorStrategies": [
    "DefaultPrimaryStorageAllocationStrategy",
    "LocalStorageAllocatorStrategy"
  ]
}
```

Name	Type	Description	Starting Version
strategies	List		0.6
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The detailed description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6

Name	Type	Description	Starting Version
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

SDK Sample

Java SDK

```
GetPrimaryStorageAllocatorStrategiesAction action = new GetPrimaryStorageAllocatorStrategiesAction();
action.sessionId = "ed5d5f6e4ac14b61a972469e88589b38";
GetPrimaryStorageAllocatorStrategiesAction.Result res = action.call();
```

Python SDK

```
GetPrimaryStorageAllocatorStrategiesAction action = GetPrimaryStorageAllocatorStrategiesAction()
action.sessionId = "78a99afd143f4ffca767a27bf9b3af93"
GetPrimaryStorageAllocatorStrategiesAction.Result res = action.call()
```

5.2.5.13 GetPrimaryStorageTypes

API Request

URLs

```
GET zstack/v1/primary-storage/types
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 4b39cdd6eaea4476bf9d93d42ddc4186" \
-X GET http://localhost:8080/zstack/v1/primary-storage/types
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	query	Optional. The system tags.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
userTags	List	query	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "primaryStorageTypes": [
    "LocalStorage",
    "NFS",
    "SharedMountPoint",
    "Ceph"
  ]
}
```

Name	Type	Description	Starting Version
types	List		0.6
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The detailed description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6

Name	Type	Description	Starting Version
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

SDK Sample

Java SDK

```
GetPrimaryStorageTypesAction action = new GetPrimaryStorageTypesAction();  
action.sessionId = "1dccf587f1de4aa998b73bb0b85c3eae";  
GetPrimaryStorageTypesAction.Result res = action.call();
```

Python SDK

```
GetPrimaryStorageTypesAction action = GetPrimaryStorageTypesAction()  
action.sessionId = "0090252c9cf641cc90bd1a3d93dfd6b6"  
GetPrimaryStorageTypesAction.Result res = action.call()
```

5.2.5.14 GetPrimaryStorageCandidatesForVolumeMigration

API Request

URLs

```
GET zstack/v1/primary-storage/volumes/{volumeUuid}/migration-candidates
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \  
-H "Authorization: OAuth 39b0ace2ecc0459c929c8e352ea906f2" \  
-X GET http://localhost:8080/zstack/v1/primary-storage/  
volumes/073f14f2d6dc437b8114faa4223f0ce8/migration-candidates
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
volumeUuid	String	url	The volume UUID.		2.2
systemTags	List	query	Optional. The system tags.		2.2
userTags	List	query	Optional. The user tags.		2.2

API Response

Sample Response

```
{
  "inventories": [
    {
      "uuid": "64776c6c7dfd46b091ec387d21b5adb0",
      "name": "PS-1"
    }
  ]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	2.2
inventories	List	See inventories .	2.2

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	2.2
description	String	The detailed description of the error.	2.2

Name	Type	Description	Starting Version
details	String	The details about the error.	2.2
elaboration	String	The reserved field. Default value: null.	2.2
opaque	LinkedHashMap	The reserved field. Default value: null.	2.2
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	2.2

#inventories

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	2.2
zoneUuid	String	The zone UUID.	2.2
name	String	The resource name.	2.2

5.2.5.18 GetPrimaryStorageCandidatesForVmMigration

API Request

URLs

```
GET zstack/v1/vm-instances/{vmInstanceUuid}/storage-migration-candidates
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/vm-instances/2ac3852f503a339f857c9381d881bd91/storage-migration-candidates
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vmInstanceUuid	String	url	The VM instance UUID.		3.1.0
withDataVolumes	boolean	body (contained in the primaryStorageMigrateVm structure)	Optional. Migrates the VM instance with its data volumes.		3.7.0
migrateStorageOnly	boolean	body (contained in the primaryStorageMigrateVm structure)	Optional. Specifies whether to migrate only across primary storage		4.4.0

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	query	Optional. The system tags.		3.1.0
userTags	List	query	Optional. The user tags.		3.1.0

API Response

Sample Response

```

interval	Long		4.7.21

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.7.21
description	String	The detailed description of the error.	4.7.21
details	String	The details about the error.	4.7.21
elaboration	String	The reserved field. Default value: null.	4.7.21
opaque	LinkedHashMap	The reserved field. Default value: null.	4.7.21
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.7.21

SDK Sample

Java SDK

```
GetPrimaryStorageLicenseInfoAction action = new GetPrimaryStorageLicenseInfoAction();
action.uuid = "9b624d6e4ca53a4aa10bfc341281d0ef";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetPrimaryStorageLicenseInfoAction.Result res = action.call();
```

Python SDK

```
GetPrimaryStorageLicenseInfoAction action = GetPrimaryStorageLicenseInfoAction()
action.uuid = "9b624d6e4ca53a4aa10bfc341281d0ef"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
GetPrimaryStorageLicenseInfoAction.Result res = action.call()
```

5.2.5.21 Local Storage Operations

5.2.5.21.1 AddLocalPrimaryStorage

API Request

URLs

```
POST zstack/v1/primary-storage/local-storage
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "url": "/Cloud_ps",
    "name": "PS1",
    "zoneUuid": "a71cbd7404e9474c81ed45d167b7eab8"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"url":"/Cloud_ps","name":"PS1","zoneUuid":"3b9a66322185343e9068b2bfd185b690"}}' \
http://localhost:8080/zstack/v1/primary-storage/local-storage
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
url	String	body (contained in the params structure)	The URL of the local storage.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The name of the local storage.		0.6
description	String	body (contained in the params structure)	Optional. The detailed description of the local storage.		0.6
type	String	body (contained in the params structure)	Optional. The primary storage type: LocalStorage.		0.6
zoneUuid	String	body (contained in the params structure)	The zone UUID.		0.6
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID. If specified, the local storage will use this field as the UUID.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {
    "name": "PS1",
    "url": "/Cloud_ps",
    "type": "LocalStorage",
    "state": "Enabled",
    "status": "Connected",
```

```

"attachedClusterUuids": [
  "562116d368c8467c95c53321757538dc"
]
}
}

```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventory	PrimaryStorageInventory	See inventory .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The short description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
zoneUuid	String	The zone UUID.	0.6
name	String	The resource name.	0.6
url	String		0.6
description	String	The detailed description of the resource.	0.6
totalCapacity	Long		0.6
availableCapacity	Long		0.6
totalPhysicalCapacity	Long		0.6
availablePhysicalCapacity	Long		0.6
systemUsedCapacity	Long		0.6
type	String		0.6
state	String		0.6
status	String		0.6

SDK Sample

Java SDK

```
AddLocalPrimaryStorageAction action = new AddLocalPrimaryStorageAction();
action.url = "/Cloud_ps";
action.name = "PS1";
action.zoneUuid = "e9762e3b848e4d0a8f36f1b2fe888b14";
action.sessionId = "01b750dce9e94191abd9216fe8c5e77b";
AddLocalPrimaryStorageAction.Result res = action.call();
```

Python SDK

```
AddLocalPrimaryStorageAction action = AddLocalPrimaryStorageAction()
action.url = "/Cloud_ps"
action.name = "PS1"
action.zoneUuid = "bd54c662683b4144b33a72a357064387"
```

```
action.sessionId = "b6dd1fd80b7144adbf23d4b1089d978d"
AddLocalPrimaryStorageAction.Result res = action.call()
```

5.2.5.21.2 QueryLocalStorageResourceRef

API Request

URLs

```
GET zstack/v1/primary-storage/local-storage/resource-refs
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 7642f366a18e41d6b9144fa25b4e32fe" \
-X GET http://localhost:8080/zstack/v1/primary-storage/local-storage/
resource-refs?q=uuid=18b4bc6daf0542b09b6756ddce3f87cd
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryLocalStorageResourceRef`, and pressing the **Tab** key.

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
QueryLocalStorageResourceRefAction action = new QueryLocalStorageResourceRefAction();
action.conditions = asList("uuid=46e9ff5cd91a404382107d52a1947614");
action.sessionId = "aaaf8ed4fe224287afff3c38083279a9";
```

```
QueryLocalStorageResourceRefAction.Result res = action.call();
```

Python SDK

```
QueryLocalStorageResourceRefAction action = QueryLocalStorageResourceRefAction()
action.conditions = ["uuid=8249a62afd0e440981775795244ab276"]
action.sessionId = "62b361c83e6a4685b13f629f3d402ed7"
QueryLocalStorageResourceRefAction.Result res = action.call()
```

5.2.5.21.3 LocalStorageMigrateVolume

API Request

URLs

```
PUT zstack/v1/primary-storage/local-storage/volumes/{volumeUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "localStorageMigrateVolume": {
    "destHostUuid": "511e02b9b8c9427c9fbbac55b8c7ec62"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"localStorageMigrateVolume":
{"destHostUuid":"58118467f70733cdb19f39bd07868384"}}' \
http://localhost:8080/zstack/v1/primary-storage/local-storage/volumes/
f15736d2850536f3a6ea1d68f7c89b7f/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
volumeUuid	String	url	The volume UUID.		0.6
destHostUuid	String	body (contained in the localStorageMigrateVolume structure)	The UUID of the destination host.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {
    "resourceUuid": "bad5e950cf014275bf9ba6e4cfe78a97",
    "primaryStorageUuid": "81d893539a6b4ce7b9957c7a5d6c5df8",
    "hostUuid": "9d250b88ae90449db567cfa18a75fecc",
    "size": 2.4035328E7
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventory	LocalStorageResource RefInventory	See inventory .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code	0.6

Name	Type	Description	Starting Version
		that specifies an error . For example, SYS.1000, HOST.1001.	
description	String	The short description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6

hostUuid	String	The host UUID.	0.6
totalCapacity	long		0.6
availableCapacity	long		0.6
totalPhysicalCapacity	long		0.6
availablePhysicalCapacity	long		0.6

SDK Sample

Java SDK

```

GetLocalStorageHostDiskCapacityAction action = new GetLocalStorageHostDiskCapacityAction();
action.hostUuid = "e63ea47c5aa14106a6abd89ddc8f43de";
action.primaryStorageUuid = "a193ec73e0824726bc30fa88f7f906cc";
action.sessionId = "0d48347e758c4089a85b586f6d2c0953";
GetLocalStorageHostDiskCapacityAction.Result res = action.call();

```

Python SDK

```

GetLocalStorageHostDiskCapacityAction action = GetLocalStorageHostDiskCapacityAction()
action.hostUuid = "fbaace8b570a4be6998dc376b95dcdf1"
action.primaryStorageUuid = "71d63b28517243538d83c326bc21423a"
action.sessionId = "cc34ee291d8a4d7bad091c4a66d97094"

```

```
GetLocalStorageHostDiskCapacityAction.Result res = action.call()
```

5.2.5.21.5 LocalStorageGetVolumeMigratableHosts

API Request

URLs

```
GET zstack/v1/volumes/{volumeUuid}/migration-target-hosts
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 47c467d5c9944985bfbfead8d44cfec2" \
-X GET http://localhost:8080/zstack/v1/volumes/
ef7fe562459146d6bb13078821d451a8/migration-target-hosts?
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
volumeUuid	String	url	The volume UUID.		0.6
systemTags	List	query	Optional. The system tags.		0.6
userTags	List	query	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

```
}
```

SDK Sample

Java SDK

```
LocalStorageGetVolumeMigratableHostsAction action = new LocalStorageGetVolumeMigratableHostsAction();
action.volumeUuid = "dd15184d915c422686da18415b194ce9";
action.sessionId = "1ce8dcd82213420ba5aea5c488834eba";
LocalStorageGetVolumeMigratableHostsAction.Result res = action.call();
```

Python SDK

```
LocalStorageGetVolumeMigratableHostsAction action = LocalStorageGetVolumeMigratableHostsAction()
action.volumeUuid = "19a3d12dc45540f997ac0c6ad0cfb8d7"
action.sessionId = "e6d54fe5d8424c45b723f65a1136d23e"
LocalStorageGetVolumeMigratableHostsAction.Result res = action.call()
```

5.2.5.22 NFS Primary Storage Operations

5.2.5.22.1 AddNfsPrimaryStorage

API Request

URLs

```
POST zstack/v1/primary-storage/nfs
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "url": "192.168.0.25:/share/nfs",
    "name": "PS1",
    "type": "NFS",
    "zoneUuid": "4539fbc9b2704ef0a9ee7ee30af7c64e"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"url":"192.168.0.25:/share/
nfs","name":"PS1","type":"NFS","zoneUuid":"9ce5da0042333fcaa16e0f7ff20aba13"}}'
http://localhost:8080/zstack/v1/primary-storage/nfs
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
url	String	body (contained in the params structure)	The public URL of NFS . Format: nfs-host:/path/to/export.		0.6
name	String	body (contained in the params structure)	The name of the NFS primary storage.		0.6
description	String	body (contained in the params structure)	Optional. The detailed description of the NFS primary storage.		0.6
type	String	body (contained in the params structure)	Optional. The primary storage type: NFS.		0.6
zoneUuid	String	body (contained in the params structure)	The zone UUID.		0.6
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID. If specified, the NFS primary storage will		0.6

Name	Type	Location	Description	Optional Value	Starting Version
			use this field as the UUID.		
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {
    "name": "PS1",
    "url": "/Cloud_ps",
    "type": "LocalStorage",
    "state": "Enabled",
    "status": "Connected",

AddNfsPrimaryStorageAction.Result res = action.call()
```

5.2.5.23 Shared Mount Point Primary Storage Operations

5.2.5.23.1 AddSharedMountPointPrimaryStorage

API Request

URLs

```
POST zstack/v1/primary-storage/smp
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "url": "/smp_mountpoint",
    "name": "smp",
    "type": "SharedMountPoint",
    "zoneUuid": "f0e339a95f5c4e8a913737160c20548d"
  },
}
```

```
"systemTags": [],
"userTags": []
}
```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"url":"/
smp_mountpoint","name":"smp","type":"SharedMountPoint","zoneUuid":"80396633969c30
\
http://localhost:8080/zstack/v1/primary-storage/smp' \
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
url	String	body (contained in the params structure)	The local URL of the Shared Mount Point primary storage.		0.6
name	String	body (contained in the params structure)	The name of the Shared Mount Point primary storage.		0.6
description	String	body (contained in the params structure)	Optional. The detailed description of the Shared Mount Point primary storage.		0.6
type	String	body (contained in the params structure)	Optional. The primary storage type: Shared Mount Point.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
zoneUuid	String	body (contained in the params structure)	The zone UUID.		0.6
resourceUuid	String	body (contained in the params structure)	Optional. The UUID of the Shared Mount Point primary storage.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {
    "name": "PS1",
    "url": "/Cloud_ps",
    "type": "SharedMountPoint",

SDK Sample

Java SDK

```
AddSharedMountPointPrimaryStorageAction action = new AddSharedMountPointPrimaryStorageAction();
action.url = "/smp_mountpoint";
action.name = "smp";
action.type = "SharedMountPoint";
action.zoneUuid = "8c54cbec38cb4704b3eb9703a8589637";
action.sessionId = "bb400831e7ce4ca19dca6469845770be";
AddSharedMountPointPrimaryStorageAction.Result res = action.call();
```

Python SDK

```
AddSharedMountPointPrimaryStorageAction action = AddSharedMountPointPrimaryStorageAction()
action.url = "/smp_mountpoint"
action.name = "smp"
action.type = "SharedMountPoint"
action.zoneUuid = "7fa8ff29d2db43b783c36800990bf6d8"
action.sessionId = "26ab143d25144285b1bde8752b761bf9"
```

```
AddSharedMountPointPrimaryStorageAction.Result res = action.call()
```

5.2.5.24 Ceph Primary Storage Operations

5.2.5.24.1 AddCephPrimaryStorage

API Request

URLs

```
POST zstack/v1/primary-storage/ceph
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "monUrls": [
      "root:password@localhost/?monPort\u003d7777"
    ],
    "rootVolumePoolName": "zs-images",
    "dataVolumePoolName": "zs-data-volume",
    "imageCachePoolName": "zs-image-cache",
    "name": "My Ceph Primary Storage",
    "zoneUuid": "d42197a462c34a44989bdf38d5aa2424"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"monUrls":["root:password@localhost/?monPort=7777"],"rootVolumePoolName":"zs-images","dataVolumePoolName":"zs-data-volume","imageCachePoolName":"zs-image-cache","name":"My Ceph Primary Storage","zoneUuid":"251a3dffccaf39fc8d190eedcf4395bf"}}' \
http://localhost:8080/zstack/v1/primary-storage/ceph
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
monUrls	List	body (contained in the params structure)	The URL list of the Ceph monitor daemon (Ceph mon).		0.6
rootVolume PoolName	String	body (contained in the params structure)	Optional. The name of the Ceph pool that is available for root volumes.		0.6
dataVolume PoolName	String	body (contained in the params structure)	Optional. The name of the Ceph pool that is available for data volumes.		0.6
imageCache PoolName	String	body (contained in the params structure)	Optional. The name of the Ceph pool that is available for image caches.		0.6
url	String	body (contained in the params structure)	The reserved field.		0.6
name	String	body (contained in the params structure)	The name of the Ceph primary storage.		0.6
description	String	body (contained in the params structure)	Optional. The detailed description of the Ceph primary storage.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
type	String	body (contained in the params structure)	Optional. The primary storage type: Ceph.		0.6
zoneUuid	String	body (contained in the params structure)	The zone UUID.		0.6
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID. If specified, the Ceph primary storage will use this field as the UUID.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

**Note:**

- When you add a Ceph primary storage to ZStack Cloud, you can specify the **manufacturer** option to **SystemTags** to identify the type of the Ceph primary storage, for example, xsky, sandstone, or open-source.
 - Format: `ceph::manufacturer::Platform`
 - Example: `ceph::manufacturer::xsky`
- When you add a Ceph primary storage to ZStack Cloud, you can specify the **thirdParty Platform** option to **SystemTags** to identify the type of the Ceph primary storage to be xsky. Then you can use a Cloud API to call the SDK of the xsky Ceph primary storage.
 - Format: `ceph::thirdPartyPlatform::TOKEN`
 - Example: `ceph::thirdPartyPlatform::68b329da9893e34099c7d8ad5cb9c940`

SDK Sample

Java SDK

```
QueryCephPrimaryStorageAction action = new QueryCephPrimaryStorageAction();
action.conditions = asList("uuid=d351d433b5974116a4c9649ef5b89e64");
action.sessionId = "172c3d6b977b4cbfbd401ace20ad0442";
QueryCephPrimaryStorageAction.Result res = action.call();
```

Python SDK

```
QueryCephPrimaryStorageAction action = QueryCephPrimaryStorageAction()
action.conditions = ["uuid=aa79df396a4943f8b9066c4d8057565d"]
action.sessionId = "0aca367c9e7946d29a63044684d5dd71"
QueryCephPrimaryStorageAction.Result res = action.call()
```

5.2.5.24.3 AddMonToCephPrimaryStorage

API Request

URLs

```
POST zstack/v1/primary-storage/ceph/{uuid}/mons
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "monUrls": [
      "10.0.1.3"
    ]
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"monUrls":["10.0.1.3"]}}' \
```

```
http://localhost:8080/zstack/v1/primary-storage/
ceph/6496e4b29793368dbacf388d83446acc/mons
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The UUID of the Ceph primary storage.		0.6
monUrls	List	body (contained in the params structure)	The URL list of the Ceph mon (monitor daemon).		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
AddMonToCephPrimaryStorageAction action = new AddMonToCephPrimaryStorageAction();
action.uuid = "d0e3946e312a40c6af85da9163ac2519";
action.monUrls = asList("10.0.1.3");
action.sessionId = "6033eea9a2514c078c7af2a709ead405";
AddMonToCephPrimaryStorageAction.Result res = action.call();
```

Python SDK

```
AddMonToCephPrimaryStorageAction action = AddMonToCephPrimaryStorageAction()
```

```

action.uuid = "6b631b40a3fa434785a8b0bd49a3f199"
action.monUrls = [10.0.1.3]
action.sessionId = "c455c88362f84aa7acd07bd5f6d3a4d3"
AddMonToCephPrimaryStorageAction.Result res = action.call()

```

5.2.5.24.4 RemoveMonFromCephPrimaryStorage

API Request

```

5.2.5.25 Shared Block Primary Storage Operations

5.2.5.25.1 AddSharedBlockGroupPrimaryStorage

API Request

URLs

```
POST zstack/v1/primary-storage/sharedblockgroup
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "diskUuids": [
      "1b5682b663b937a59adb9e318cab6b05"
    ],
    "name": "shared-block-group-1",
    "type": "SharedBlock",
    "zoneUuid": "eee8b39ad50b300c8935e554a967691b"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"diskUuids":
["1b5682b663b937a59adb9e318cab6b05"],"name":"shared-block-
group-1","type":"SharedBlock","zoneUuid":"eee8b39ad50b300c8935e554a967691b"}}'
http://localhost:8080/zstack/v1/primary-storage/sharedblockgroup
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
diskUuids	List	body (contained in	The unique identifier of		2.3.2

Name	Type	Location	Description	Optional Value	Starting Version
		the params structure)	the disk. For example, UUID, WWN, and WWID.		
name	String	body (contained in the params structure)	The resource name.		2.3.2
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		2.3.2
type	String	body (contained in the params structure)	Optional. The primary storage type: SharedBlock.		2.3.2
url	String	body (contained in the params structure)	The reserved field.		2.3.2
zoneUuid	String	body (contained in the params structure)	The zone UUID.		2.3.2
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		2.3.2
systemTags	List	body	Optional. The system tags.		2.3.2
userTags	List	body	Optional. The user tags.		2.3.2

**Note:**

- When you add a Shared Block primary storage in ZStack Cloud, you can specify the default volume provisioning strategy by adding the **primaryStorageVolumeProvisioningStrategy** option to **SystemTags**.
 - Format of the **primaryStorageVolumeProvisioningStrategy** option: `primaryStorageVolumeProvisioningStrategy::ThinProvisioning`, `primaryStorageVolumeProvisioningStrategy::ThickProvisioning`
 - Example: `primaryStorageVolumeProvisioningStrategy::ThinProvisioning`, `primaryStorageVolumeProvisioningStrategy::ThickProvisioning`

SDK Sample

Java SDK

```
QuerySharedBlockGroupPrimaryStorageAction action = new QueryShare
dBlockGroupPrimaryStorageAction();
action.conditions = asList();
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QuerySharedBlockGroupPrimaryStorageAction.Result res = action.call();
```

Python SDK

```
QuerySharedBlockGroupPrimaryStorageAction action = QueryShare
dBlockGroupPrimaryStorageAction()
action.conditions = []
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
QuerySharedBlockGroupPrimaryStorageAction.Result res = action.call()
```

5.2.5.25.4 AddSharedBlockToSharedBlockGroup

API Request

URLs

```
POST zstack/v1/primary-storage/sharedblockgroup/{uuid}/sharedblocks
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "diskUuid": "3bc916e4700e36c9ad9575fcf47222ab"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"diskUuid":"3bc916e4700e36c9ad9575fcf47222ab"}}'
http://localhost:8080/zstack/v1/primary-storage/
sharedblockgroup/506367e0d66d3fdb92eda345ed347c21/sharedblocks
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
diskUuid	String	body (contained in the params structure)	The unique identifier of the disk. For example, UUID, WWN, and WWID.		2.3.2

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The LUN group UUID.		2.3.2
systemTags	List	body	Optional. The system tags.		2.3.2
userTags	List	body	Optional. The user tags.		2.3.2

API Response

sharedBlockGroupUuid	String	The LUN group UUID.	2.3.2
diskUuid	String	The unique identifier of the disk. For example , UUID, WWN, and WWID.	2.3.2
name	String	The resource name.	2.3.2
description	String	The detailed description of the resource.	2.3.2
createDate	Timestamp	The creation date.	2.3.2
lastOpDate	Timestamp	The last operation date.	2.3.2
type	SharedBlockType	See type .	2.3.2
state	SharedBlockState	See state .	2.3.2
status	SharedBlockStatus	See status .	2.3.2

#type

Name	Type	Description	Starting Version
name	String	The resource name.	2.3.2
ordinal	int		2.3.2

#state

Name	Type	Description	Starting Version
name	String	The resource name.	2.3.2
ordinal	int		2.3.2

#status

Name	Type	Description	Starting Version
name	String	The resource name.	2.3.2
ordinal	int		2.3.2

SDK Sample

Java SDK

```
QuerySharedBlockAction action = new QuerySharedBlockAction();
action.conditions = asList();
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QuerySharedBlockAction.Result res = action.call();
```

Python SDK

```
QuerySharedBlockAction action = QuerySharedBlockAction()
action.conditions = []
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QuerySharedBlockAction.Result res = action.call()
```

5.2.5.26 XStor Block Primary Storage Operations

5.2.5.26.1 AddBlockPrimaryStorage

API Request

URLs

```
POST zstack/v1/primary-storage/block
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "param": {
    "vendorName": "XStor",
    "metadata": "{\u0027ip\u0027:\u0027127.0.0.1\u0027, \u0027port\u0027:8443, \u0027username\u0027:\u0027test\u0027, \u0027password\u0027:\u0027password\u0027}"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"param":
{"vendorName":"XStor","metadata":{"ip':'127.0.0.1', 'port':8443,
'username':'test', 'password':'password'}}}' http://
localhost:8080/zstack/v1/primary-storage/block
```

Request Parameters

Name	Type	Location	Description	Valid Values	Starting Version
vendorName	String	body (contained in the param structure)	The storage vendor name.		4.6.0
metadata	String	body (contained in the param structure)	The storage metadata.		4.6.0
url	String	body (contained in the param structure)	Unused.		4.6.0
name	String	body (contained in the param structure)	The name of the Block primary storage.		4.6.0
description	String	body (contained in the param structure)	Optional. The detailed description of the Block primary storage.		4.6.0
type	String	body (contained in the param structure)	Optional. The primary storage type . The type is Block here.		4.6.0

Name	Type	Location	Description	Valid Values	Starting Version
zoneUuid	String	body (contained in the param structure)	The zone UUID.		4.6.0
resourceUuid	String	body(contained in the param structure)	Optional. The resource UUID.		4.6.0
tagUuids	List	body (contained in the param structure)	Optional. The tag UUID list.		4.6.0
systemTags	List	body	Optional. The system tags.		4.6.0
userTags	List	body	Optional. The user tags.		4.6.0

API Response

Response Sample

```
{
  "inventory": {
    "name": "PS1",
    "url": "/zstack_ps",
    "type": "LocalStorage",
    "state": "Enabled",
    "status": "Connected",

      "c6e9684e8bb93a9192c946dcd0564b39"
    ]
  }
}
```

Name	Type	Description	Starting Version
success	boolean		4.6.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error	4.6.0

Name	Type	Description	Starting Version
inventory	PrimaryStorageInventory	For detailed version, see inventory .	4.6.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	4.6.0
description	String	The brief description of the error.	4.6.0
details	String	The details about the error.	4.6.0
elaboration	String	The reserved field. Default value: null.	4.6.0
opaque	LinkedHashMap	The reserved field. Default value: null.	4.6.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	4.6.0
zoneUuid	String	The zone UUID.	4.6.0
name	String	The resource name.	4.6.0
url	String		4.6.0
description	String	The detailed information of the resource.	4.6.0
totalCapacity	Long	The total capacity.	4.6.0
availableCapacity	Long	The available capacity.	4.6.0
totalPhysicalCapacity	Long	总物理空间	4.6.0
availablePhysicalCapacity	Long	The available physical capacity.	4.6.0

Name	Type	Description	Starting Version
systemUsedCapacity	Long	The system used capacity.	4.6.0
type	String	The primary storage type.	4.6.0
state	String	The running state.	4.6.0
status	String	The connection status.	4.6.0
mountPath	String		4.6.0
createDate	Timestamp	The creation date.	4.6.0
lastOpDate	Timestamp	The last operation date.	4.6.0
attachedClusterUuids	List	The cluster attached to .	4.6.0

SDK Sample

Java SDK

```
AddBlockPrimaryStorageAction action = new AddBlockPrimaryStorageAction();
action.vendorName = "XStor";
action.metadata = "{\"ip':'127.0.0.1', 'port':8443, 'username':'test', 'password':'password'}";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
AddBlockPrimaryStorageAction.Result res = action.call();
```

Python SDK

```
AddBlockPrimaryStorageAction action = AddBlockPrimaryStorageAction()
action.vendorName = "XStor"
action.metadata = "{\"ip':'127.0.0.1', 'port':8443, 'username':'test', 'password':'password'}"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
AddBlockPrimaryStorageAction.Result res = action.call()
```

5.2.5.26.2 GetBlockPrimaryStorageMetadata

API Request

URLs

```
POST zstack/v1/primary-storage/block/metadata
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "param": {
    "vendorName": "XStor",
    "metadata": "{\u0027ip\u0027:\u0027127.0.0.1\u0027,\u0027port\u0027:\u00278443\u0027,\u0027username\u0027:\u0027test\u0027,\u0027password\u0027:\u0027123\u0027}"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"param":

cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.8.0

SDK Sample

Java SDK

```
UpdateBlockPrimaryStorageAction action = new UpdateBlockPrimaryStorageAction();
action.vendorName = "XStor";
action.metadata = "{ 'ip': '127.0.0.1', 'port': 8443, 'user': 'test', 'password': 'password' }";
action.uuid = "blockPrimaryStorageUuid";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateBlockPrimaryStorageAction.Result res = action.call();
```

Python SDK

```
UpdateBlockPrimaryStorageAction action = UpdateBlockPrimaryStorageAction()
action.vendorName = "XStor"
action.metadata = "{ 'ip': '127.0.0.1', 'port': 8443, 'user': 'test', 'password': 'password' }"
action.uuid = "blockPrimaryStorageUuid"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
UpdateBlockPrimaryStorageAction.Result res = action.call()
```

5.2.6 Backup Storage Operations

5.2.6.1 DeleteBackupStorage

API Request

URLs

```
DELETE zstack/v1/backup-storage/{uuid}?deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 3cb9fd3d9fad4f64b62086b1aeabf42a" \
-X DELETE http://localhost:8080/zstack/v1/backup-
storage/12b157dc061a46739168b6e87bf2657f?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
deleteMode	String	body	Optional. The delete mode . Options: Permissive Enforcing. Default mode: Permissive.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteBackupStorageAction action = new DeleteBackupStorageAction();
action.uuid = "1c8acbc2af8445a5b631350276787580";
action.deleteMode = "Permissive";
action.sessionId = "4caf9cc241604dbca3088779d6772dbe";
DeleteBackupStorageAction.Result res = action.call();
```

Python SDK

```
DeleteBackupStorageAction action = DeleteBackupStorageAction()
action.uuid = "06473459fd474a26bb1d79e2edd004f3"
action.deleteMode = "Permissive"
action.sessionId = "a6fead8970fe45cfa6ba92e7dcf08d66"
DeleteBackupStorageAction.Result res = action.call()
```

5.2.6.2 QueryBackupStorage

API Request

URLs

```
GET zstack/v1/backup-storage
GET zstack/v1/backup-storage/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth dce9c25b65254343b0f9a568a661f348" \
-X GET http://localhost:8080/zstack/v1/backup-storage?
q=uuid=435e61f882cf431bb4ae48246489a988
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth fe9a6571fc9949e7a0d31d94fae9b87c" \
```

```
-X GET http://localhost:8080/zstack/v1/backup-storage/1ab3b836a88342e1bbc1b1a17d092f0f
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryBackupStorage**, and pressing the **Tab** key.

API Response

SDK Sample

Java SDK

```
QueryBackupStorageAction action = new QueryBackupStorageAction();
action.conditions = asList("uuid=b8e17834373747ae8b6555db80e74586");
action.sessionId = "f5d478c4facf42f4a3f16c8efbfd9628";
QueryBackupStorageAction.Result res = action.call();
```

Python SDK

```
QueryBackupStorageAction action = QueryBackupStorageAction()
action.conditions = ["uuid=0359113913834277bc815b446a6eff25"]
action.sessionId = "dc56b36c279f449ea2d430d2513a4cb0"
QueryBackupStorageAction.Result res = action.call()
```

5.2.6.3 ReconnectBackupStorage

API Request

URLs

```
PUT zstack/v1/backup-storage/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "reconnectBackupStorage": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"reconnectBackupStorage":{}}' \
http://localhost:8080/zstack/v1/backup-storage/37ea58b550103d40b23420e870bd616f/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{

Java SDK

```
ReconnectBackupStorageAction action = new ReconnectBackupStorageAction();
action.uuid = "f68e2350598547198b72bd578d14b037";
action.sessionId = "dcc8725e00f4437889104fe6ce942f96";
ReconnectBackupStorageAction.Result res = action.call();
```

Python SDK

```
ReconnectBackupStorageAction action = ReconnectBackupStorageAction()
action.uuid = "2f2571f4864c46778544b500d006dfe7"
action.sessionId = "a1c68d6ead48410ab9fd255d4c73f843"
ReconnectBackupStorageAction.Result res = action.call()
```

5.2.6.4 ChangeBackupStorageState

API Request

URLs

```
PUT zstack/v1/backup-storage/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeBackupStorageState": {
    "stateEvent": "Disabled"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"changeBackupStorageState":{"stateEvent":"disable"}}' \
http://localhost:8080/zstack/v1/backup-storage/7d2e0c9d7b3734f28b3a22eab93ddb63/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
stateEvent	String	body (contained in the changeBackupStorageState structure)	The target state of the backup storage.	- enable - disable	0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {
    "name": "My Backup Storage",
    "description": "Public Backup Storage",
    "totalCapacity": 1.073741824E9,

ChangeBackupStorageStateAction.Result res = action.call();
```

Python SDK

```
ChangeBackupStorageStateAction action = ChangeBackupStorageStateAction()
action.uuid = "1576b0cf06b041d99e5f615b72bb384f"
action.stateEvent = "Disabled"
action.sessionId = "4226acacae2b489c8ba81e4af682a57a"
```

```
ChangeBackupStorageStateAction.Result res = action.call()
```

5.2.6.5 GetBackupStorageCapacity

API Request

URLs

```
GET zstack/v1/backup-storage/capacities
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 4804c84fa75e442e890d3a01a5bc2882" \
-X GET http://localhost:8080/zstack/v1/backup-storage/capacities?
zoneUuids=6c4a26e1ec274395977b1fd98144dd27&all=true
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
zoneUuids	List	query	Optional. The zone UUID list.		0.6
backupStorageUuids	List	query	Optional. The backup storage UUID list. - Make sure that at least one of zoneUuids and backupStorageUuids is specified. - Or, set all to true.		0.6
all	boolean	query	Optional. If backupStorageUuids		0.6

Name	Type	Location	Description	Optional Value	Starting Version
			is null, this parameter is set true, which means that all backup storages in the system are queried.		
systemTags	List	query	Optional. The system tags.		0.6
userTags	List	query	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "totalCapacity": 1.073741824E9,
  "availableCapacity": 9.68884224E8
}
```

Name	Type	Description	Starting Version
totalCapacity	long	The total capacity. Unit : byte.	0.6
availableCapacity	long	The available capacity . Unit: byte.	0.6
success	boolean	Whether the API succeeds.	0.6
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
	ErrorCode	See error .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

SDK Sample

Java SDK

```
GetBackupStorageCapacityAction action = new GetBackupStorageCapacityAction();
action.zoneUuids = asList("aae3e25dc11b41f8ae41739814949cfe");
action.all = true;
action.sessionId = "fbcc6cc548a44caea69bb492ea13a4bd";
GetBackupStorageCapacityAction.Result res = action.call();
```

Python SDK

```
GetBackupStorageCapacityAction action = GetBackupStorageCapacityAction()
action.zoneUuids = [afa2a794d1244f55acc0f8d2d0e5cdc7]
action.all = true
action.sessionId = "1574e3585df94016a047e1d836978f3e"
```

```
GetBackupStorageCapacityAction.Result res = action.call()
```

5.2.6.6 GetBackupStorageTypes

API Request

URLs

```
GET zstack/v1/backup-storage/types
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \  
-H "Authorization: OAuth 47583a9a72f84121b84135296f3af8cf" \  
-X GET http://localhost:8080/zstack/v1/backup-storage/types
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	query	Optional. The system tags.		0.6
userTags	List	query	Optional. The user tags.		0.6

API Response

Sample Response

```
{  
  "backupStorageTypes": [  
    "Ceph",  
    "ImageStore"  
  ]  
}
```

Name	Type	Description	Starting Version
types	List	The type list of the backup storage.	0.6
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For	0.6

Name	Type	Description	Starting Version
		more information, see error .	

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

SDK Sample

Java SDK

```
GetBackupStorageTypesAction action = new GetBackupStorageTypesAction();
action.sessionId = "010841c1e6ea46cd9cde645ad31cc2e4";
GetBackupStorageTypesAction.Result res = action.call();
```

Python SDK

```
GetBackupStorageTypesAction action = GetBackupStorageTypesAction()
action.sessionId = "0c34591f7bcf4460ba3db2791b164f01"
```

```
GetBackupStorageTypesAction.Result res = action.call()
```

5.2.6.7 UpdateBackupStorage

API Request

URLs

```
PUT zstack/v1/backup-storage/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateBackupStorage": {
    "name": "New Name"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateBackupStorage":{"name":"New Name"}}' \
http://localhost:8080/zstack/v1/backup-storage/72f0f262f3323515b177d148ad1efb66/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The UUID of the target backup storage.		0.6
name	String	body (contained in the	Optional. The new name of		0.6

Name	Type	Location	Description	Optional Value	Starting Version
		updateBackupStorage structure)	the backup storage.		
description	String	body (contained in the updateBackupStorage structure)	Optional. The new description of the backup storage.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {
    "name": "New Name",
    "description": "Public Backup Storage",

http://localhost:8080/zstack/v1/backup-
storage/03c75cf832863825b43696ea22d5d1ad/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
backupStorageUuid	String	url	The backup storage UUID.		1.7
imageUuid	String	body (contained in the exportImageFromBackupStorage structure)	The image UUID.		1.7
exportFormat	String	body (contained in the exportImageFromBackupStorage structure)	Optional. The format for storing the exported image.		3.9.0
systemTags	List	body	Optional. The system tags.		1.7
userTags	List	body	Optional. The user tags.		1.7

API Response

Sample Response

```
{
  "imageUrl": "http://bs-host-name/path/to/image.qcow2",
  "exportMd5Sum": "8a239d17b045dea51c4677fa90a42ed8"
```

}

Name	Type	Description	Starting Version
imageUrl	String	The exported image URL.	1.7
exportMd5Sum	String	The MD5 checksum value of the exported image.	3.9.0
success	boolean	Whether the API succeeds.	1.7
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	1.7

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

SDK Sample

Java SDK

```
ExportImageFromBackupStorageAction action = new ExportImageFromBackupStorageAction();
action.backupStorageUuid = "b95c2eef6b8d44248305bc21b58324dd";
action.imageUuid = "a8e908dd49a444d2ad37dd729a2d881f";
action.sessionId = "f58bf3e6d8294d488573fc62511a2ad0";
ExportImageFromBackupStorageAction.Result res = action.call();
```

Python SDK

```
ExportImageFromBackupStorageAction action = ExportImageFromBackupStorageAction()
action.backupStorageUuid = "dda8b4f308534e98a5fc2facdbc7936e"
action.imageUuid = "7ed5c3c65ae941dabe9ecc00b7a1b015"
action.sessionId = "f724920d165944218cd71b76e755757e"
ExportImageFromBackupStorageAction.Result res = action.call()
```

5.2.6.9 DeleteExportedImageFromBackupStorage

API Request

URLs

```
DELETE/v1/backup-storage/{backupStorageUuid}/exported-images/{imageUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth bb7d8495054d412fa8c7c16b8625222c" \
-X DELETE http://localhost:8080/zstack/v1/backup-storage/c03c38ab9d184143891718c4b3f664d1/exported-images/dce27bd0a0ae4aaa8771ac33d481ec52?
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
backupStorageUuid	String	url	The backup storage UUID.		1.7
imageUuid	String	url	The image UUID.		1.7

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	body	Optional. The system tags.		1.7
userTags	List	body	Optional. The user tags.		1.7

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteExportedImageFromBackupStorageAction action = new DeleteExportedImageFromBackupStorageAction();
action.backupStorageUuid = "9c781fd5c7334e8492c9d3409ad0c63a";
action.imageUuid = "b9b4f79d505040eba37ad6e4581b64fd";
action.sessionId = "ecce8dd56c3a476c8dd1ac90aeb0d321";
DeleteExportedImageFromBackupStorageAction.Result res = action.call();
```

Python SDK

```
DeleteExportedImageFromBackupStorageAction action = DeleteExportedImageFromBackupStorageAction()
action.backupStorageUuid = "29e4e1a659004403bd9b3738b36dd37e"
action.imageUuid = "2ba013855b8f4c688d977b545272541f"
action.sessionId = "e2c772523e104f3da969630930e68a17"
```

```
DeleteExportedImageFromBackupStorageAction.Result res = action.call()
```

5.2.6.10 SyncImage

API Request

URLs

```
PUT zstack/v1/backup-storage/image-store/{imageStoreUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "syncImage": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"syncImage":{}}' \
http://localhost:8080/zstack/v1/backup-storage/image-store/81f447310d194ef5a8c0f7bbdc8401/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
imageStoreUuid	String	url	The UUID of the backup storage.		4.7.11
systemTags	List	body	Optional. The system tags.		4.7.11
userTags	List	body	Optional. The user tags.		4.7.11

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	4.7.11
description	String	The brief description of the error.	4.7.11
details	String	The details about the error.	4.7.11
elaboration	String	The reserved field. Default value: null.	4.7.11
opaque	LinkedHashMap	The reserved field. Default value: null.	4.7.11
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.7.11

SDK Sample

Java SDK

```
SyncImageAction action = new SyncImageAction();
action.imageStoreUuid = "cff07127e2134fe28396a1aaeb70a1cf";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
SyncImageAction.Result res = action.call();
```

Python SDK

```
SyncImageAction action = SyncImageAction()
action.imageStoreUuid = "8a1247ffe8354566adb6ccae56aa1db3"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
SyncImageAction.Result res = action.call()
```

5.2.6.11 AttachBackupStorageToZone

API Request

URLs

```
POST zstack/v1/zones/{zoneUuid}/backup-storage/{backupStorageUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{}}' http://localhost:8080/zstack/
v1/zones/5776b543bc713f6d9abca9cd605c8199/backup-
storage/53ef01cbf71d3bd68206908b87e51403
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
zoneUuid	String	url	The zone UUID.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
backupStorageUuid	String	url	The backup storage UUID.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {
    "name": "My Backup Storage",
    "description": "Public Backup Storage",
    "totalCapacity": 1073741824,
    "availableCapacity": 968884224,

```

```
GetBackupStorageCandidatesForImageMigrationAction.Result res = action.call()
```

5.2.6.15 ImageStore Backup Storage Operations

5.2.6.15.1 AddImageStoreBackupStorage

API Request

URLs

```
POST zstack/v1/backup-storage/image-store
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "hostname": "192.168.1.8",
    "username": "admin",
    "password": "admin%pass",
    "sshPort": 22.0,
    "url": "/data/imagestore",
    "name": "ImageStore",
    "importImages": false
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"hostname":"192.168.1.8","username":"admin","password":"admin
%pass","sshPort":22.0,"url":"/data/
imagestore","name":"ImageStore","importImages":false}}' \
http://localhost:8080/zstack/v1/backup-storage/image-store
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
hostname	String	body (contained in the params structure)	The hostname of the ImageStore backup storage.		1.6
username	String	body (contained in the params structure)	The SSH username of the backup storage. This parameter is used to deploy Ansible.		1.6
password	String	body (contained in the params structure)	The SSH password of the ImageStore backup storage.		1.6
sshPort	int	body (contained in the params structure)	Optional. The SSH port of the ImageStore backup storage.		1.6
url	String	body (contained in the params structure)	The path for storing local data in the ImageStore backup storage.		1.6
name	String	body (contained in the params structure)	The name of the ImageStore backup storage.		1.6
description	String	body (contained in	Optional. The description of the		1.6

Name	Type	Location	Description	Optional Value	Starting Version
		the params structure)	ImageStore backup storage.		
type	String	body (contained in the params structure)	Optional. The backup storage type : ImageStore BackupStorage.		1.6
importImages	boolean	body (contained in the params structure)	Optional. Whether to import images.		1.9
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID. If specified, the ImageStore backup storage will use this field as the UUID.		1.6
systemTags	List	body (contained in the params structure)	Optional. The system tags.		1.6
userTags	List	body (contained in the params structure)	Optional. The user tags.		1.6

**Note:**

- When you add an ImageStore backup storage in ZStack Cloud, you can specify the method to mount the storage path of the ImageStore backup storage by adding the **fsInfo** option to **SystemTags**.

- Format of the **fsInfo** option: `fsInfo::type::$TYPE::url::$URL::options::$OPTIONS`
- Example: `fsInfo::type::nfs::url::172.32.1.119:/nas/nfs2::options::nolock,vers=3,rsiz=32768,wsiz=32768`

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
AddImageStoreBackupStorageAction action = new AddImageStoreBackupStorageAction();
action.hostname = "192.168.1.8";
action.username = "admin";
action.password = "admin%pass";
action.sshPort = 22.0;
action.url = "/data/imagestore";
action.name = "ImageStore";
action.importImages = false;
action.sessionId = "5171f258102a43368597dedd6317622b";
AddImageStoreBackupStorageAction.Result res = action.call();
```

Python SDK

```
AddImageStoreBackupStorageAction action = AddImageStoreBackupStorageAction()
action.hostname = "192.168.1.8"
action.username = "admin"
action.password = "admin%pass"
action.sshPort = 22.0
action.url = "/data/imagestore"
action.name = "ImageStore"
action.importImages = False
action.sessionId = "7b360d3775524a9780474b07ff68ed15"
```

```
AddImageStoreBackupStorageAction.Result res = action.call()
```

5.2.6.15.2 QueryImageStoreBackupStorage

API Request

URLs

```
GET zstack/v1/backup-storage/image-store
GET zstack/v1/backup-storage/image-store/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth f3580612efa9402082b0b57447e3fbc9" \
-X GET http://localhost:8080/zstack/v1/backup-storage/image-store?
q=uuid=5870d2edddff4ccc9f27a67e3a23391a
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 3831efab7c7a40ce88149e508f433169" \
-X GET http://localhost:8080/zstack/v1/backup-storage/image-
store/3f326deb28fa4176964867d888b197a4
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryImageStoreBackupStorage**, and pressing the **Tab** key.

5.2.6.15.5 ReclaimSpaceFromImageStore

API Request

URLs

```
PUT zstack/v1/backup-storage/image-store/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "reclaimSpaceFromImageStore": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"reclaimSpaceFromImageStore":{}}' \
http://localhost:8080/zstack/v1/backup-storage/image-store/
ec74c4664f52342e898fb0fa966d915e/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The ImageStore backup storage UUID.		1.10
systemTags	List	body (contained in the params structure)	Optional. The system tags.		1.10

Name	Type	Location	Description	Optional Value	Starting Version
userTags	List	body (contained in the params structure)	Optional. The user tags.		1.10

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

attachedZoneUuids	List		0.6

SDK Sample

Java SDK

```
QueryCephBackupStorageAction action = new QueryCephBackupStorageAction();
action.conditions = asList("uuid=fd7807cb1d744273bf8632362f2095aa");
action.sessionId = "940c1b37499e4e3c831625717ddb1c8f";
```

```
QueryCephBackupStorageAction.Result res = action.call();
```

Python SDK

```
QueryCephBackupStorageAction action = QueryCephBackupStorageAction()
action.conditions = ["uuid=2c8474f249234365993ba771e4b495ba"]
action.sessionId = "2b7bb843955e4574b8ca8862d0223f8d"
QueryCephBackupStorageAction.Result res = action.call()
```

5.2.6.16.3 UpdateCephBackupStorageMon

API Response

URLs

```
PUT zstack/v1/backup-storage/ceph/mons/{monUuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateCephBackupStorageMon": {
    "hostname": "10.0.1.4"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateCephBackupStorageMon":{"hostname":"10.0.1.4"}}' \
http://localhost:8080/zstack/v1/backup-storage/ceph/mons/
c239e1d3164b3383bd12828632f706d6/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
monUuid	String	url	The Ceph mon (monitor)		0.6

Name	Type	Location	Description	Optional Value	Starting Version
			daemon) UUID.		
hostname	String	body (contained in the updateCeph BackupStorageMon structure)	Optional. The new hostname of the Ceph mon.		0.6
sshUsername	String	body (contained in the updateCeph BackupStorageMon structure)	Optional. The SSH username of the Ceph mon.		0.6
sshPassword	String	body (contained in the updateCeph BackupStorageMon structure)	Optional. The SSH password of the Ceph mon.		0.6
sshPort	Integer	body (contained in the updateCeph BackupStorageMon structure)	Optional. The SSH port of the Ceph mon.		0.6
monPort	Integer	body (contained in the updateCeph BackupStorageMon structure)	Optional. The port of the Ceph mon.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

SDK Sample

Java SDK

```
QueryScsiLunAction action = new QueryScsiLunAction();
action.conditions = asList();
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryScsiLunAction.Result res = action.call();
```

Python SDK

```
QueryScsiLunAction action = QueryScsiLunAction()
action.conditions = []
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryScsiLunAction.Result res = action.call()
```

5.2.7.2 DetachScsiLunFromHost

API Request

URLs

```
PUT zstack/v1/storage-devices/scsi-lun/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "detachScsiLunFromHost": {
    "hostUuid": "dce542427a3a3d1fa13324c9f67352cb"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"detachScsiLunFromHost":
{"hostUuid":"dce542427a3a3d1fa13324c9f67352cb"}}' http://
localhost:8080/zstack/v1/storage-devices/scsi-lun/
fb5d3f596f683bd7a3b1bf1c396d5f4d/actions
```

Request Parameters

Name	Type	Location	Description	Valid Value	Starting Version
uuid	String	url	The SCSI LUN UUID.		4.2.0
hostUuid	String	body (contained in the detachScsiLunFromHost structure)	Optional. The host UUID.		4.2.0
systemTags	List	body	Optional. The system tags.		4.2.0
userTags	List	body	Optional. The user tags.		4.2.0

SDK Sample

Java SDK

```
AddIscsiServerAction action = new AddIscsiServerAction();
action.ip = "10.0.0.201";
action.port = 3260.0;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
AddIscsiServerAction.Result res = action.call();
```

Python SDK

```
AddIscsiServerAction action = AddIscsiServerAction()
action.ip = "10.0.0.201"
action.port = 3260.0
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
AddIscsiServerAction.Result res = action.call()
```

5.2.7.3.2 DeleteIscsiServer

API Request

URLs

```
DELETE zstack/v1/storage-devices/iscsi/servers/{uuid}?
deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/storage-devices/iscsi/
servers/7a3f7749fd393899b4b74d2b470e15eb?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The iSCSI server UUID.		3.0.0
deleteMode	String	url	Optional. The delete mode.		3.0.0
systemTags	List	body	Optional. The system tags.		3.0.0

Name	Type	Location	Description	Optional Value	Starting Version
userTags	List	body	Optional. The user tags.		3.0.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteIscsiServerAction action = new DeleteIscsiServerAction();
action.uuid = "7a3f7749fd393899b4b74d2b470e15eb";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteIscsiServerAction.Result res = action.call();
```

Python SDK

```
DeleteIscsiServerAction action = DeleteIscsiServerAction()
action.uuid = "7a3f7749fd393899b4b74d2b470e15eb"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteIscsiServerAction.Result res = action.call()
```

5.2.7.3.3 QueryIscsiServer

API Request

URLs

```
GET zstack/v1/storage-devices/iscsi/servers
GET zstack/v1/storage-devices/iscsi
```

```
GET zstack/v1/storage-devices/iscsi/servers/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {},
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{}}' http://localhost:8080/zstack/v1/storage-devices/iscsi/servers/0243c5d7322a36718ad76d865682ba44
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.0.0
systemTags	List	body	Optional. The system tags.		3.0.0
userTags	List	body	Optional. The user tags.		3.0.0

lastOpDate	Timestamp	The last operation date.	3.0.0

SDK Sample

Java SDK

```
DetachIscsiServerFromClusterAction action = new DetachIscsiServerFromClusterAction();
action.uuid = "132d1caceecd3847b30bd901485ccc44";
action.clusterUuid = "81ecbd4ae7c9346aa3225592441c36df";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DetachIscsiServerFromClusterAction.Result res = action.call();
```

Python SDK

```
DetachIscsiServerFromClusterAction action = DetachIscsiServerFromClusterAction()
action.uuid = "132d1caceecd3847b30bd901485ccc44"
action.clusterUuid = "81ecbd4ae7c9346aa3225592441c36df"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DetachIscsiServerFromClusterAction.Result res = action.call()
```

5.2.7.3.8 QueryIscsiLun

API Request

URLs

```
GET zstack/v1/storage-devices/iscsi/luns
GET zstack/v1/storage-devices/iscsi/luns/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/storage-devices/iscsi/luns
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
```

```
-X GET http://localhost:8080/zstack/v1/storage-devices/iscsi/luns/da96929549c63b66b8afc63be70a373f
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QueryIscsiLun**, and pressing the **Tab** key.

SDK Sample

Java SDK

```
QueryFiberChannelStorageAction action = new QueryFiberChannelStorageAction();
action.conditions = asList();
```

```
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryFiberChannelStorageAction.Result res = action.call();
```

Python SDK

```
QueryFiberChannelStorageAction action = QueryFiberChannelStorageAction()
action.conditions = []
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
QueryFiberChannelStorageAction.Result res = action.call()
```

5.2.7.4.2 RefreshFiberChannelStorage

API Request

URLs

```
POST zstack/v1/storage-devices/fiber-channel/controllers
POST zstack/v1/storage-devices/fiber-channel/controllers/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "uuid": "52049ca66e8135f5aac2835aecab62a0"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"uuid":"52049ca66e8135f5aac2835aecab62a0"}}'
http://localhost:8080/zstack/v1/storage-devices/fiber-channel/
controllers
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"uuid":"52049ca66e8135f5aac2835aecab62a0"}}'
http://localhost:8080/zstack/v1/storage-devices/fiber-channel/
controllers/52049ca66e8135f5aac2835aecab62a0
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	body (contained in the params structure)	Optional. The FC SAN storage UUID.		3.1.0
zoneUuid	String	body (contained in the params structure)	The zone UUID.		3.1.0
systemTags	List	body	Optional. The system tags.		3.1.0
userTags	List	body	Optional. The user tags.		3.1.0

```

5.2.7.4.3 UpdateScsiLun

API Request

URLs

```
PUT zstack/v1/storage-devices/scsi-lun/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateScsiLun": {
    "name": "test-scsi-lun"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateScsiLun":{"name":"test-scsi-lun"}}'
http://localhost:8080/zstack/v1/storage-devices/scsi-lun/
e2e9d7f44ee23960bc6e4e31b0a010d9/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.1.0
name	String	body (contained in the updateScsiLun structure)	Optional. The resource name.		3.1.0
state	String	body (contained in the updateScsiLun structure)	Optional. The state.	- Enabled - Disabled	3.1.0
systemTags	List	body	Optional. The system tags.		3.1.0
userTags	List	body	Optional. The user tags.		3.1.0

API Response

Sample Response

5.2.7.4.6 CheckScsiLunClusterStatus**API Request**

URLs

```
PUT zstack/v1/storage-devices/scsi-lun/{uuid}/cluster/{clusterUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "checkScsiLunClusterStatus": {},
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"checkScsiLunClusterStatus":{}}'
http://localhost:8080/zstack/v1/storage-devices/
scsi-lun/abe6bf1e763739f88f97055c14246245/
cluster/5415c2beb8a93447a27f69c109cdfb23
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.1.0
clusterUuid	String	url	The cluster UUID.		3.1.0
systemTags	List	body	Optional. The system tags.		3.1.0
userTags	List	body	Optional. The user tags.		3.1.0

path	String	The disk path.	4.6.21
hctl	String	The disk HCTL.	4.6.21
createDate	Timestamp	The creation date.	4.6.21
lastOpDate	Timestamp	The last operation date.	4.6.21

SDK Sample

Java SDK

```
QueryNvmeTargetAction action = new QueryNvmeTargetAction();
action.conditions = asList();
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
QueryNvmeTargetAction.Result res = action.call();
```

Python SDK

```
QueryNvmeLunAction action = QueryNvmeLunAction()
action.conditions = []
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
QueryNvmeLunAction.Result res = action.call()
```

5.2.7.5.3 RefreshNvmeTarget

API Request

URLs

```
POST zstack/v1/storage-devices/nvme/controllers
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "zoneUuid": "7a7b52cf91933070af3c8273f30ef458"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \-X POST -d
'{"params":{"zoneUuid":"7a7b52cf91933070af3c8273f30ef458"}}' \
http://localhost:8080/zstack/v1/storage-devices/nvme/controllers
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/storage-devices/nvme
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/storage-devices/nvme/
controllers/de0f2549ed0130948f14b00916fbf9a0
```

Required Parameters

Name	Type	Location	Description	Valid Values	Satrtting Version
zoneUuid	String	body(contained in the params structure)	The zone UUID.		4.6.21
nvmeLunUuids	List	body(contained in the params structure)	Optional. The NVMe disk UUID.		4.6.21
systemTags	List	body	Optional. The system tags.		4.6.21
userTags	List	body	Optional. The user tags.		4.6.21

API Response

Sample Response

```

5.2.8 Physical Network Operations

5.2.8.1 CreateHostNetworkServiceType

API Request

URLs

```
POST zstack/v1/hosts/service-types
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "serviceType": "ManagementNetwork",
    "system": true
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"serviceType": "ManagementNetwork", "system": true}}' \
http://localhost:8080/zstack/v1/hosts/service-types
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
serviceType	String	body (contained in the params structure)	The network type.		5.3.0

Name	Type	Location	Description	Optional Value	Starting Version
system	boolean	body (contained in the params structure)	Optional.		5.3.0
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		5.3.0
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID.		5.3.0
systemTags	List	body	Optional. The system tags.		5.3.0
userTags	List	body	Optional. The user tags.		5.3.0

API Response

Sample Response

```
{
  "inventory": {}
}
```

Name	Type	Description	Starting Version
success	boolean		5.3.0
inventory	HostNetworkLabelInventory	See inventory .	5.3.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	5.3.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	5.3.0
serviceType	String	The service type.	5.3.0
system	Boolean	The system status.	5.3.0
createDate	Timestamp	The creation date.	5.3.0
lastOpDate	Timestamp	The last operation date.	5.3.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	5.3.0
description	String	The brief description of the error.	5.3.0
details	String	The details about the error.	5.3.0
elaboration	String	The reserved field. Default value: null.	5.3.0
opaque	LinkedHashMap	The reserved field. Default value: null.	5.3.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	5.3.0

SDK Sample

Java SDK

```
CreateHostNetworkServiceTypeAction action = new CreateHostNetworkServiceTypeAction();
action.serviceType = "ManagementNetwork";
action.system = true;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
CreateHostNetworkServiceTypeAction.Result res = action.call();
```

Python SDK

```
CreateHostNetworkServiceTypeAction action = CreateHostNetworkServiceTypeAction()
action.serviceType = "ManagementNetwork"
action.system = true
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CreateHostNetworkServiceTypeAction.Result res = action.call()
```

5.2.8.2 UpdateHostNetworkServiceType

API Request

URLs

```
PUT zstack/v1/hosts/service-types/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateHostNetworkServiceType": {
    "serviceType": "ManagementNetwork",
    "system": true
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateHostNetworkServiceType":
{"serviceType":"ManagementNetwork","system":true}}' \
http://localhost:8080/zstack/v1/hosts/service-
types/63513aaff0a13c6fa9f9661acf9cd64b/actions
```

Request Parameters

名字	类型	位置	描述	可选值	起始版本
uuid	String	url	The resource UUID.		5.3.0
serviceType	String	body(contained in the updateHostNetworkServiceType structure)	The network type.		5.3.0
system	boolean	body(contained in the updateHostNetworkServiceType structure)	Optional.		5.3.0
systemTags	List	body	Optional. The system tags.		5.3.0
userTags	List	body	Optional. The user tags.		5.3.0

API Response

Sample Response

```
{
  "inventory": {}
}
```

Name	Type	Description	Starting Version
success	boolean		5.3.0
inventory	HostNetworkLabelInventory	See inventory .	5.3.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	5.3.0

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	5.3.0
serviceType	String	The service type.	5.3.0
system	Boolean	The system status.	5.3.0
createDate	Timestamp	The creation date.	5.3.0
lastOpDate	Timestamp	The last operation date.	5.3.0

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	5.3.0
description	String	The brief description of the error.	5.3.0
details	String	The details about the error.	5.3.0
elaboration	String	The reserved field. Default value: null.	5.3.0
opaque	LinkedHashMap	The reserved field. Default value: null.	5.3.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	5.3.0

SDK Sample

Java SDK

```
UpdateHostNetworkServiceTypeAction action = new UpdateHostNetworkServiceTypeAction();
action.uuid = "63513aaff0a13c6fa9f9661acf9cd64b";
action.serviceType = "ManagementNetwork";
action.system = true;
```

```
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateHostNetworkServiceTypeAction.Result res = action.call();
```

Python SDK

```
UpdateHostNetworkServiceTypeAction action = UpdateHostNetworkSer
viceTypeAction()
action.uuid = "63513aaff0a13c6fa9f9661acf9cd64b"
action.serviceType = "ManagementNetwork"
action.system = true
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
UpdateHostNetworkServiceTypeAction.Result res = action.call()
```

5.2.8.3 DeleteHostNetworkServiceType

API Request

URLs

```
DELETE zstack/v1/hosts/service-types/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/hosts/service-
types/21ce80c3a7783e11b78a343a50470abf
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		5.3.0
deleteMode	String	body	Optional. The deleting mode (Permissive /Enforcing, Permissive).		5.3.0
systemTags	List	body	Optional. The system tags.		5.3.0
userTags	List	body	Optional. The user tags.		5.3.0

API Response

The API returns an empty JSON structure {} upon success, and a JSON structure containing an error field in case of failure, for example:

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteHostNetworkServiceTypeAction action = new DeleteHostNetworkServiceTypeAction();
action.uuid = "21ce80c3a7783e11b78a343a50470abf";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DeleteHostNetworkServiceTypeAction.Result res = action.call();
```

Python SDK

```
DeleteHostNetworkServiceTypeAction action = DeleteHostNetworkServiceTypeAction()
action.uuid = "21ce80c3a7783e11b78a343a50470abf"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
DeleteHostNetworkServiceTypeAction.Result res = action.call()
```

5.2.8.4 SetServiceTypeOnHostNetworkInterface

API Request

URLs

```
POST zstack/v1/hosts/nics/service-types
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "interfaceUuids": [
      "2894f52c7d84366c85dd115b3bc193ca"
    ]
  },
  "systemTags": [],
}
```

```
"userTags": []
}
```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"interfaceUuids":
["2894f52c7d84366c85dd115b3bc193ca"]}}' \
http://localhost:8080/zstack/v1/hosts/nics/service-types
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
interfaceUuids	List	body (contained in the params structure)	The physical NIC port UUID list.		4.7.11
vlanIds	List	body (contained in the params structure)	Optional. The VLAN interface ID list.		4.7.11
serviceTypes	List	body (contained in the params structure)	Optional. The network type.	• Management Network • TenantNetwork • StorageNetwork • BackupNetwork • MigrationNetwork	4.7.11
systemTags	List	body	Optional. The system tags.		4.7.11
userTags	List	body	Optional. The user tags.		4.7.11

API Response

Sample Response

```
{
  "inventory": [
    {
      "id": 0,
      "interfaceUuid": "8534263f624a3962b7603c99a3e44eb2",
      "vlanId": 10,
      "serviceType": "BackupNetwork"
    }
  ]
}
```

Name	Type	Description	Starting Version
success	boolean		4.7.11
inventory	List	See inventory .	4.7.11
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	4.7.11

#inventory

Name	Type	Description	Starting Version
interfaceUuid	String	The physical NIC port UUID.	4.7.11

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	4.7.11
description	String	The brief description of the error.	4.7.11
details	String	The details about the error.	4.7.11
elaboration	String	The reserved field. Default value: null.	4.7.11
opaque	LinkedHashMap	The reserved field. Default value: null.	4.7.11
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	4.7.11

SDK Sample

Java SDK

```
SetServiceTypeOnHostNetworkBondingAction action = new SetServiceTypeOnHostNetworkBondingAction();
action.bondingUuids = asList("e96881d20cde3a9ab337cdf0ab4e8b08");
action.serviceTypes = asList("TenantNetwork");
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
SetServiceTypeOnHostNetworkBondingAction.Result res = action.call();
```

Python SDK

```
SetServiceTypeOnHostNetworkBondingAction action = SetServiceTypeOnHostNetworkBondingAction()
action.bondingUuids = [e96881d20cde3a9ab337cdf0ab4e8b08]
action.serviceTypes = [TenantNetwork]
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
SetServiceTypeOnHostNetworkBondingAction.Result res = action.call()
```

5.2.8.6 GetCandidateInterfaceVlanIds

API Request

URLs

```
GET zstack/v1/host/network-interface-vlan-ids
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl示例

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/host/network-interface-vlan-ids?interfaceUuids=d25e83af6ccf3d9ca8baa1702861a0c8&limit=1000&start=0
```

参数列表

Name	Type	Location	Description	Optional Value	Starting Version
interfaceUuids	List	query	The NIC port UUIDs		4.7.11
limit	Integer	query			4.7.11
start	Integer	query			4.7.11
systemTags	List	query	Optional. The system tags.		4.7.11
userTags	List	query	Optional. The user tags.		4.7.11

API Response

Sample Response

```
{
  "vlanIds": [
    1010,
    1011,
    10,
    11,
    2000,
    1101,
    1110,
    1108,
```

```

        1107,
        1109,
        1106,
        1103,
        1102,
        1105,
        1104,
        0
    ],
    "success": true
}

```

Name	Type	Description	Starting Version
vlanIds	List	The Vlan interface ID list.	4.7.11
success	boolean		4.7.11
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error	4.7.11

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	4.7.11
description	String	The brief description of the error.	4.7.11
details	String	The details about the error.	4.7.11
elaboration	String	The reserved field. Default value: null.	4.7.11
opaque	LinkedHashMap	The reserved field. Default value: null.	4.7.11
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error	4.7.11

Name	Type	Description	Starting Version
		exists, this parameter is null.	

SDK Sample

Java SDK

```
GetCandidateInterfaceVlanIdsAction action = new GetCandidateInterfaceVlanIdsAction();
action.interfaceUuids = asList("d25e83af6ccf3d9ca8baa1702861a0c8");
action.limit = 1000;
action.start = 0;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetCandidateInterfaceVlanIdsAction.Result res = action.call();
```

Python SDK

```
GetCandidateInterfaceVlanIdsAction action = GetCandidateInterfaceVlanIdsAction()
action.interfaceUuids = [d25e83af6ccf3d9ca8baa1702861a0c8]
action.limit = 1000
action.start = 0
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetCandidateInterfaceVlanIdsAction.Result res = action.call()
```

5.2.8.7 GetInterfaceServiceTypeStatistic

API Request

URLs

```
GET zstack/v1/hosts/hosts-network-interfaces/service-type-statistic
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/hosts/hosts-network-interfaces/service-type-statistic? \
interfaceUuid=d8797841479d3951bcb698164b56bd9e&interfaceType=All&sortBy=CreateDate
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
interfaceUuid	String	query	Optional. The NIC port UUID.		4.7.11
vlanId	Integer	query	Optional. The VLAN interface ID.		4.7.11
interfaceType	String	query	Optional. The NIC port type.	• All • Interface • Bonding	4.7.11
serviceType	List	query	Optional. The network type.	• All • Management Network • TenantNetwork • StorageNetwork • MigrationNetwork • BackupNetwork	4.7.11
zoneUuid	String	query	Optional. The zone UUID.		4.7.11
clusterUuid	String	query	Optional. The cluster UUID.		4.7.11
hostUuid	String	query	Optional. The host UUID.		4.7.11
sortBy	String	query	Optional. The sort method.	• InterfaceName • VlanId • HostIp • HostName • ClusterName • CreateDate	4.7.11

Name	Type	Location	Description	Optional Value	Starting Version
sortDirection	String	query	Optional. The sort direction.	- asc - desc	4.7.11
start	Integer	query	Optional. The location where the statistics starts.		4.7.11
limit	Integer	query	Optional. The count of the statistics.		4.7.11
replyWithCount	boolean	query	Optional. Whether to return both the statistics result and count.		4.7.11
systemTags	List	query	Optional. The system tags.		4.7.11
userTags	List	query	Optional. The user tags.		4.7.11

API Response

Sample Response

```
{
  "serviceTypeStatistics": [
    {
      "interfaceUuid": "474f9d7d7a1d3b46b8f17363dca7ebef",
      "serviceTypes": [
        "ManagementNetwork"
      ]
    }
  ],
  "total": 1
}
```

Name	Type	Description	Starting Version
total	Long	The total count of the statistics.	4.7.11

Name	Type	Description	Starting Version
success	boolean	Whether the API succeeds.	4.7.11
serviceTypeStatistics	List	See serviceTypeStatistics .	4.7.11
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error	4.7.11

#serviceTypeStatistics

名字	类型	描述	起始版本
interfaceUuid	String	The network interface UUID.	4.7.11
interfaceName	String	The network interface name.	4.7.11
vlanId	Integer	The vlan interface ID.	4.7.11
serviceTypes	List	The network type list.	4.7.11
hostUuid	String	The host UUID.	4.7.11
hostName	String	The host name.	4.7.11
hostIp	String	The host IP.	4.7.11
clusterUuid	String	The cluster UUID.	4.7.11
clusterName	String	The cluster name.	4.7.11
zoneUuid	String	The zone UUID.	4.7.11
createDate	Timestamp	The date of creation.	4.7.11

#error

名字	类型	描述	起始版本
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	0.6

名字	类型	描述	起始版本
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

SDK Sample

Java SDK

```
GetInterfaceServiceTypeStatisticAction action = new GetInterfaceServiceTypeStatisticAction();
action.interfaceUuid = "d8797841479d3951bcb698164b56bd9e";
action.interfaceType = "All";
action.sortBy = "CreateDate";
action.sortDirection = "asc";
action.start = 0;
action.limit = 20;
action.replyWithCount = false;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetInterfaceServiceTypeStatisticAction.Result res = action.call();
```

Python SDK

```
GetInterfaceServiceTypeStatisticAction action = GetInterfaceServiceTypeStatisticAction()
action.interfaceUuid = "d8797841479d3951bcb698164b56bd9e"
action.interfaceType = "All"
action.sortBy = "CreateDate"
action.sortDirection = "asc"

action.limit = 20
action.replyWithCount = false
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
GetInterfaceServiceTypeStatisticAction.Result res = action.call()
```

5.2.8.8 ChangeHostNetworkInterfaceLldpMode

API Request

URLs

```
PUT zstack/v1/hostNetworkInterface/lldp/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeHostNetworkInterfaceLldpMode": {
    "interfaceUuids": [
      "f37102496ac2357aaa214622322adb65"
    ],
    "mode": "rx_only"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"changeHostNetworkInterfaceLldpMode":{"interfaceUuids":
["f37102496ac2357aaa214622322adb65"],"mode":"rx_only"}}' \
http://localhost:8080/zstack/v1/hostNetworkInterface/lldp/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
interfaceUuid	List	body (contained in the changeHost NetworkInt erfaceLldp	The physical NIC port UUID		5.0.0

Name	Type	Location	Description	Optional Value	Starting Version
		Mode structure)			
mode	String	body (contained in the changeHostNetworkInterfaceLdpMode structure)	Optional. The lldp mode.	• rx_only • tx_only • rx_and_tx • disable	5.0.0
systemTags	List	body	Optional. The system tags.		5.0.0
userTags	List	body	Optional. The user tags.		5.0.0

API Response

Sample Response

```
{
  "inventories": [
    {
      "interfaceUuid": "1cae08c11e8530a8bf892df7ef709249",
      "mode": "rx_only"
    }
  ]
}
```

Name	Type	Description	Starting Version
success	boolean		5.0.0
inventory	List	See inventrois .	5.0.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	5.0.0

#inventories

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	5.0.0

QueryHostNetworkInterfaceLldpAction.Result res = action.call()
```

5.3 Network Resource

5.3.1 Hardware SDN Controller Operations

5.3.1.1 AddSdnController

API Request

URLs

```
POST zstack/v1/sdn-controllers
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "vendorType": "vendor",
    "name": "sdn-1",
    "description": "sdn controller from vendor",
    "ip": "192.168.1.1",
    "userName": "admin",
    "password": "password"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
{"vendorType":"vendor","name":"sdn-1","description":"sdn controller
from
```

```
vendor", "ip": "192.168.1.1", "userName": "admin", "password": "password"}}
```

http://localhost:8080/zstack/v1/sdn-controllers

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vendorType	String	body (contained in the params structure)			3.7.0
name	String	body (contained in the params structure)	The resource name.		3.7.0
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		3.7.0
ip	String	body (contained in the params structure)			3.7.0
userName	String	body (contained in the params structure)	Optional. The user name.		5.3.20
password	String	body (contained in the params structure)	Optional. The password.		5.3.20
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		3.7.0
tagUuids	List	body (contained in the params structure)	Optional. The tag UUID list.		3.7.0

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	body	Optional. The system tags.		3.7.0
userTags	List	body	Optional. The user tags.		3.7.0

**Note:**

- When you add an SDN controller in ZStack Cloud, you can create an H3C SDN controller by adding the **H3C_VDS_UUID** option to **SystemTags**. The SystemTag is passed by using the **vdsUuid** parameter.
 - Format of the **H3C_VDS_UUID** option: `vdsUuid::{%s}`
 - Example: `vdsUuid::1234-5678`
 - Associated resource: `SdnControllerV0.class`

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "2f7e443a152833efb0f4b7d196a35ce0",

SDK Sample

Java SDK

```
AddSdnControllerAction action = new AddSdnControllerAction();
```

```

action.vendorType = "vendor";
action.name = "sdn-1";
action.description = "sdn controller from vendor";
action.ip = "192.168.1.1";
action.userName = "admin";
action.password = "password";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
AddSdnControllerAction.Result res = action.call();

```

Python SDK

```

AddSdnControllerAction action = AddSdnControllerAction()
action.vendorType = "vendor"
action.name = "sdn-1"
action.description = "sdn controller from vendor"
action.ip = "192.168.1.1"
action.userName = "admin"
action.password = "password"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
AddSdnControllerAction.Result res = action.call()

```

5.3.1.2 RemoveSdnController

API Request

URLs

```
DELETE zstack/v1/sdn-controllers/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/sdn-controllers/237901c5097b38c480315569a1ac7567?deleteMode=Permissive

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.7.0
deleteMode	String	body	Optional. The delete mode.		3.7.0
systemTags	List	body	Optional. The system tags.		3.7.0

Name	Type	Location	Description	Optional Value	Starting Version
userTags	List	body	Optional. The user tags.		3.7.0

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
RemoveSdnControllerAction action = new RemoveSdnControllerAction();
action.uuid = "237901c5097b38c480315569a1ac7567";
action.deleteMode = "Permissive";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
RemoveSdnControllerAction.Result res = action.call();
```

Python SDK

```
RemoveSdnControllerAction action = RemoveSdnControllerAction()
action.uuid = "237901c5097b38c480315569a1ac7567"
action.deleteMode = "Permissive"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
RemoveSdnControllerAction.Result res = action.call()
```

5.3.1.3 QuerySdnController

API Request

URLs

```
GET zstack/v1/sdn-controllers
```

```
GET zstack/v1/sdn-controllers/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/sdn-controllers?
q=uuid=5e897e7e3a663786b873a3e020dbfc0a
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/sdn-
controllers/37c3e4f7602930c5888107528521ac90
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering **QuerySdnController**, and pressing the **Tab** key.

API Response

```

5.3.1.4 UpdateSdnController

API Request

URLs

```
PUT zstack/v1/sdn-controllers/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateSdnController": {
    "name": "Test-Net",
    "description": "Test"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateSdnController":{"name":"Test-Net","description":"Test"}}' http://localhost:8080/zstack/v1/sdn-controllers/4a39301758b13cda968bdcd866452d14/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.7.0
name	String	body (contained in the	Optional. The resource name.		3.7.0

5.3.2 L2 Network Operations

5.3.2.1 CreateL2VxlanNetworkPool

API Request

URLs

```
POST zstack/v1/l2-networks/vxlan-pool
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "Test-NetPool",
    "description": "Test",
    "zoneUuid": "ec6cc473d1c345528b92da754cd8fa00"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"name":"Test-NetPool","description":"Test","zoneUuid":"2de2048daac33068aecac1f5b40d1343"}}' \
http://localhost:8080/zstack/v1/l2-networks/vxlan-pool
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The resource name.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		0.6
zoneUuid	String	body (contained in the params structure)	The zone UUID.		0.6
physicalInterface	String	body (contained in the params structure)			0.6
type	String	body (contained in the params structure)	Optional. The type.		0.6
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6
vSwitchType	String	body (contained in the params structure)	Optional. The type of the vSwitch.	- LinuxBridge - OvsDpdk	4.8.0
tagUuid	List	body (contained in the params structure)	Optional. The Uuid tags list.		4.8.0

API Response

Sample Response

```

Name	Type	Location	Description	Optional Value	Starting Version
tagUuids	List	body (contained in the params structure)	Optional. The Uuid tags list.		3.4.0
isolated	Boolean	body (contained in the params structure)	Optional.		5.3.20
pvlan	String	body (contained in the params structure)	Optional.		5.3.20

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

Name	Type	Description	Starting Version
success	boolean		0.6
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventory	L2VxlanNetworkPoolInventory	See inventory .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
name	String	The resource name.	0.6
description	String	The detailed description of the resource.	0.6
zoneUuid	String	The zone UUID.	0.6
physicalInterface	String	The physical interface.	5.3.20
type	String	The type of L2 network .	5.3.20
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6

Name	Type	Description	Starting Version
attachedClusterUuids	List	The attached cluster UUID.	5.3.20

SDK Sample

Java SDK

```
CreateL2NoVlanNetworkAction action = new CreateL2NoVlanNetworkAction
();
action.name = "Test-Net";
action.description = "Test";
action.zoneUuid = "c23ba5023fcb3b4b8c3e76c443005e3d";
action.physicalInterface = "eth0";
action.vSwitchType = "LinuxBridge";
action.isolated = false;
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
CreateL2NoVlanNetworkAction.Result res = action.call();
```

Python SDK

```
CreateL2NoVlanNetworkAction action = CreateL2NoVlanNetworkAction()
action.name = "Test-Net"
action.description = "Test"
action.zoneUuid = "c23ba5023fcb3b4b8c3e76c443005e3d"
action.physicalInterface = "eth0"
action.vSwitchType = "LinuxBridge"
action.isolated = false
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CreateL2NoVlanNetworkAction.Result res = action.call()
```

5.3.2.6 CreateL2VlanNetwork

API Request

URLs

```
POST zstack/v1/l2-networks/vlan
```

Headers

```
OAuth: the-session-uuid
```

Body

```
{
  "params": {
    "vlan": 10,
    "name": "Test-Net",
    "description": "Test",
    "zoneUuid": "43af355e5eae3ab0b74ee76ca9c19005",
    "physicalInterface": "eth0",
    "vSwitchType": "LinuxBridge",
```

```

    "isolated": false
  },
  "systemTags": [],
  "userTags": []
}

```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"vlan":10,"name":"Test-Net","description":"Test","zoneUuid":"43af355e5eae3ab0b74ee76ca9c19005","physicalInterface":"eth0"}}' \
http://localhost:8080/zstack/v1/l2-networks/vlan

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
vlan	Integer	body (contained in the params structure)			0.6
name	String	body (contained in the params structure)	The resource name.		0.6
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		0.6
zoneUuid	String	body (contained in the params structure)	The zone UUID.		0.6
physicalInterface	String	body (contained in the params structure)			0.6

Name	Type	Location	Description	Optional Value	Starting Version
type	String	body (contained in the params structure)	Optional.		0.6
vSwitchType	String	body (contained in the params structure)	Optional. The type of the vSwitch.	- LinuxBridge - OvsDpdk - MacVlan	0.6
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6
tagUuids	List	body (contained in the params structure)	Optional. The Uuid tags list.		4.8.0
solated	Boolean	body (contained in the params structure)			5.0.0

API Response

When the API succeeded, an empty JSON structure `{}` is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "inventory": {
    "vlan": 10,
    "name": "Test-Net",
    "description": "Test",
    "zoneUuid": "75aea7e72b5a3ce7a1f87efb70ac6339",
    "physicalInterface": "eth0",
    "type": "L2VlanNetwork"
  }
}
```

}

Name	Type	Description	Starting Version
success	boolean		0.6
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventory	L2VxlanNetworkPoolInventory	See inventory .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventory

Name	Type	Description	Starting Version
vlan	Integer		0.6
uuid	String	The resource UUID.	0.6
name	String	The resource name.	0.6
description	String	The detailed description of the resource.	0.6
zoneUuid	String	The zone UUID.	0.6
physicalInterface	String		0.6
type	String		0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6
attachedClusterUuids	List		0.6

SDK Sample

Java SDK

```
CreateL2VlanNetworkAction action = new CreateL2VlanNetworkAction();
action.vlan = 10;
action.name = "Test-Net";
action.description = "Test";
action.zoneUuid = "43af355e5eae3ab0b74ee76ca9c19005";
action.physicalInterface = "eth0";

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	query	Optional. The system tags.		0.6
userTags	List	query	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "l2NetworkTypes": [
    "L2VlanNetwork",
    "L2NoVlanNetwork"
  ]
}
```

Name	Type	Description	Starting Version
types	List		0.6
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

SDK Sample

Java SDK

```
GetL2NetworkTypesAction action = new GetL2NetworkTypesAction();
action.sessionId = "485005865e744e19a12ad2f9af2ea997";
GetL2NetworkTypesAction.Result res = action.call();
```

Python SDK

```
GetL2NetworkTypesAction action = GetL2NetworkTypesAction()
action.sessionId = "b34f3c756aa542789f35bc1774845bc1"
GetL2NetworkTypesAction.Result res = action.call()
```

5.3.2.13 AttachL2NetworkToCluster

API Request

URLs

```
POST zstack/v1/l2-networks/{l2NetworkUuid}/clusters/{clusterUuid}
```

Headers

```
OAuth: the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST http://localhost:8080/zstack/v1/l2-
networks/e852ba6eb4c03f2fafdb73ce838d8980/
clusters/112816423a1a3b50a58d54fd1f6a8665
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
l2NetworkUuid	String	url	The L2 network UUID.		0.6
clusterUuid	String	url	The cluster UUID.		0.6
l2Provider Type	String	body	Optional. The type of L2 network provider.	LinuxBridge	4.8.0

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {
    "vlan": 10,
    "name": "Test-Net",
    "description": "Test",
    "zoneUuid": "95ab67ece21e3ce39896b9b391a21a94",
    "physicalInterface": "eth0",
    "type": "L2VlanNetwork"
  }
}
```

Name	Type	Description	Starting Version
success	boolean		4.8.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventory	L2NetworkInventory	See inventory .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6

Name	Type	Description	Starting Version
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
name	String	The resource name.	0.6
description	String	The detailed description of the resource.	0.6
zoneUuid	String	The zone UUID.	0.6
physicalInterface	String		0.6
type	String		0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6
attachedClusterUuids	List		0.6

SDK Sample

Java SDK

```
AttachL2NetworkToClusterAction action = new AttachL2NetworkToClusterAction();
action.l2NetworkUuid = "e852ba6eb4c03f2fafdb73ce838d8980";
action.clusterUuid = "112816423a1a3b50a58d54fd1f6a8665";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
```

```
AttachL2NetworkToClusterAction.Result res = action.call();
```

Python SDK

```
AttachL2NetworkToClusterAction action = AttachL2NetworkToClusterAction
()
action.l2NetworkUuid = "e852ba6eb4c03f2fafdb73ce838d8980"
action.clusterUuid = "112816423a1a3b50a58d54fd1f6a8665"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
AttachL2NetworkToClusterAction.Result res = action.call()
```

5.3.2.14 DetachL2NetworkFromCluster

API Request

URLs

```
DELETE/v1/l2-networks/{l2NetworkUuid}/clusters/{clusterUuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X DELETE http://localhost:8080/zstack/v1/

clusters/2fb51e7e35d339c4bac77819a9c4fea1?
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
l2NetworkUuid	String	url	The L2 network UUID.		0.6
clusterUuid	String	url	The cluster UUID.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {
    "vlan": 10,
    "name": "Test-Net",
    "description": "Test",
    "zoneUuid": "7a531508c19d396d84abeda34b83d946",
    "physicalInterface": "eth0",
    "type": "L2VlanNetwork"
  }
}
```

Name	Type	Description	Starting Version
success	boolean		4.8.0
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventory	L2NetworkInventory	See inventory .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root	0.6

Name	Type	Description	Starting Version
		cause of the current error. If no root error exists, this parameter is null.	

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
name	String	The resource name.	0.6
description	String	The detailed description of the resource.	0.6
zoneUuid	String	The zone UUID.	0.6
physicalInterface	String		0.6
type	String		0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6
attachedClusterUuids	List		0.6

SDK Sample

Java SDK

```
DetachL2NetworkFromClusterAction action = new DetachL2NetworkFromClusterAction();
action.l2NetworkUuid = "baef7db345553050846947bb2d818be0";
action.clusterUuid = "2fb51e7e35d339c4bac77819a9c4fea1";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
DetachL2NetworkFromClusterAction.Result res = action.call();
```

Python SDK

```
DetachL2NetworkFromClusterAction action = DetachL2NetworkFromClusterAction()
action.l2NetworkUuid = "baef7db345553050846947bb2d818be0"
action.clusterUuid = "2fb51e7e35d339c4bac77819a9c4fea1"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
DetachL2NetworkFromClusterAction.Result res = action.call()
```

5.3.2.15 CreateVniRange

API Request

URLs

```
POST zstack/v1/l2-networks/vxlan-pool/{l2NetworkUuid}/vni-ranges
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "TestVniRange",
    "description": "Here is a Vni Range",
    "startVni": 10.0,
    "endVni": 5000.0
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"name":"TestVniRange","description":"Here is a Vni Range","startVni":10.0,"endVni":5000.0}}' \
http://localhost:8080/zstack/v1/l2-networks/vxlan-pool/66b7ddcebeea33eaaa39a2b4667267ab/vni-ranges
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The resource name.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		0.6
startVni	Integer	body (contained in the params structure)			0.6
endVni	Integer	body (contained in the params structure)			0.6
l2NetworkUuid	String	url	The VXLAN pool UUID.		0.6
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {
    "name": "TestVniRange",
    "description": "Here is a Vni Range",
    "startVni": 10.0,
    "endVni": 5000.0,
    "l2NetworkUuid": "252d938da43a48c98ce93fe7163f14df"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation	0.6

Name	Type	Description	Starting Version
		fails, or vice versa. For more information, see error .	
inventory	VniRangeInventory	See inventory .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventory

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
name	String	The resource name.	0.6
description	String	The detailed description of the resource.	0.6
startVni	Integer		0.6

Name	Type	Description	Starting Version
endVni	Integer		0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6
l2NetworkUuid	String	The L2 network UUID.	0.6

SDK Sample

Java SDK

```
CreateVniRangeAction action = new CreateVniRangeAction();
action.name = "TestVniRange";
action.description = "Here is a Vni Range";
action.startVni = 10.0;
action.endVni = 5000.0;
action.l2NetworkUuid = "9548ed5fc8434782890d5c6ae24d87a7";
action.sessionId = "977eac0795364c5995c20120e9e35ca1";
CreateVniRangeAction.Result res = action.call();
```

Python SDK

```
CreateVniRangeAction action = CreateVniRangeAction()
action.name = "TestVniRange"
action.description = "Here is a Vni Range"
action.startVni = 10.0
action.endVni = 5000.0
action.l2NetworkUuid = "d55172d6e90e403da46074d53c680838"
action.sessionId = "dfacd10f07444a99bca68426cc19f079"
CreateVniRangeAction.Result res = action.call()
```

5.3.2.16 QueryVniRange

API Request

URLs

```
GET zstack/v1/l2-networks/vxlan-pool/vni-range
GET zstack/v1/l2-networks/vxlan-pool/vni-range/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 337c51002a0f4fec9b9ced4cdd9ca08d" \
```

```
-X GET http://localhost:8080/zstack/v1/l2-networks/vxlan-pool/vni-range
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 69245f8e344f4adf95454deb1bfe74fb" \
-X GET http://localhost:8080/zstack/v1/l2-networks/vxlan-pool/vni-range/4397921aaa5d45c7ba9bbde764b89389
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryVniRange`, and pressing the **Tab** key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "name": "Test-Range",
      "description": "Test",
      "startVni": 10.0,
      "endVni": 10000.0,
      "l2NetworkUuid": "32e0539245504a22a474ea2f34db16d0"
    }
  ]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventories	List	See inventories .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6

Name	Type	Description	Starting Version
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventories

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
name	String	The resource name.	0.6
description	String	The detailed description of the resource.	0.6
startVni	Integer		0.6
endVni	Integer		0.6
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6
l2NetworkUuid	String	The L2 network UUID.	0.6

SDK Sample

Java SDK

```
QueryVniRangeAction action = new QueryVniRangeAction();
action.conditions = asList();
action.sessionId = "eb1c573c6d4240ecb746321b12f9e1d3";
```

```
QueryVniRangeAction.Result res = action.call();
```

Python SDK

```
QueryVniRangeAction action = QueryVniRangeAction()
action.conditions = []
action.sessionId = "89f7a520087049dcdbd87f91aa20994fa"
QueryVniRangeAction.Result res = action.call()
```

5.3.2.17 DeleteVniRange

API Request

URLs

```
DELETE/v1/l2-networks/vxlan-pool/vni-ranges/{uuid}?deleteMode={
deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 49bf51476d4f49e3b6322688a4c02027" \
-X DELETE http://localhost:8080/zstack/v1/l2-networks/vxlan-pool/vni-
ranges/57aae81f5ed248e3bea4509843ab919f?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
deleteMode	String	body	Optional. The delete mode.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteVniRangeAction action = new DeleteVniRangeAction();
action.uuid = "8ad0e38ae63d4f2d86b9cd2283c5df03";
action.deleteMode = "Permissive";
action.sessionId = "85100440f4f94c68ba0884e09c7429dc";
DeleteVniRangeAction.Result res = action.call();
```

Python SDK

```
DeleteVniRangeAction action = DeleteVniRangeAction()
action.uuid = "4aef50ec1f784e66ab79ef021216389d"
action.deleteMode = "Permissive"
action.sessionId = "dfbae4e4897f497a9803a2a5dc23f848"
DeleteVniRangeAction.Result res = action.call()
```

5.3.2.18 UpdateVniRange

API Request

URLs

```
PUT zstack/v1/l2-networks/vxlan-pool/vni-ranges/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateVniRange": {
    "name": "VNI-NEW"
  },
  "systemTags": [],
  "userTags": []
}
```

}

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateVniRange":{"name":"VNI-NEW"}}' http://
localhost:8080/zstack/v1/l2-networks/vxlan-pool/vni-ranges/
f85dd9a8fc33c6a55f4786e0ffae52
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		3.3.0
name	String	body	Optional. The name.		3.3.0
systemTags	List	body	Optional. The system tags.		3.3.0
userTags	List	body	Optional. The user tags.		3.3.0

API Response**Sample Response**

```
{
  "inventory": {
    "name": "Test-Range",
    "description": "Test",
    "startVni": 10.0,
    "endVni": 10000.0,
    "l2NetworkUuid": "73f29ba3afd83876830ab1794046e47a"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For	3.3.0

Name	Type	Description	Starting Version
		more information, see error .	

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error . For example, SYS.1000, HOST.1001.	3.3.0
description	String	The brief description of the error.	3.3.0
details	String	The details about the error.	3.3.0
elaboration	String	The reserved field. Default value: null.	3.3.0
opaque	LinkedHashMap	The reserved field. Default value: null.	3.3.0
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	3.3.0

SDK Sample

Java SDK

```
UpdateVniRangeAction action = new UpdateVniRangeAction();
action.uuid = "f85dd9a8fcdc33c6a55f4786e0ffae52";
action.name = "VNI-NEW";
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
UpdateVniRangeAction.Result res = action.call();
```

Python SDK

```
UpdateVniRangeAction action = UpdateVniRangeAction()
action.uuid = "f85dd9a8fcdc33c6a55f4786e0ffae52"
action.name = "VNI-NEW"
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
```

```
UpdateVniRangeAction.Result res = action.call()
```

5.3.2.19 CreateL2TfNetwork

API Request

URLs

```
POST zstack/v1/l2-networks/tf
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "Tf-L2-Network",
    "description": "Test",
    "zoneUuid": "10f059adb4c83f5ba9a296369d52ffbe",
    "vSwitchType": "LinuxBridge"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"name":"Tf-L2-Network","description":"Test","zoneUuid":"10f059adb4c83f5ba9a296369d52ffbe","vSwitchType":"LinuxBridge"},"systemTags":[],"userTags":[]}' \
http://localhost:8080/zstack/v1/l2-networks/tf
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
ipPrefix	String	body (contained in the params structure)	Optional. The IP address prefix.		4.8.0

Name	Type	Location	Description	Optional Value	Starting Version
ipPrefixLength	Integer	body (contained in the params structure)	Optional. The IP address prefix length.		4.8.0
name	String	body (contained in the params structure)	The resource name.		4.8.0
description	String	body (contained in the params structure)	Optional. The detailed description of the resource.		4.8.0
zoneUuid	String	body (contained in the params structure)	The zone UUID.		4.8.0
physicalInterface	String	body (contained in the params structure)	The physical interface.		4.8.0
type	String	body (contained in the params structure)	Optional. The L2 network type.		4.8.0
vSwitchType	String	body (contained in the params structure)	Optional. The type of the vSwitch.	- LinuxBridge - OvsDpdk - MacVlan	4.8.0
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID.		4.8.0
tagUuids	List	body (contained in the params structure)	Optional. The Uuid tags list.		4.8.0

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	body	Optional. The system tags.		4.8.0
userTags	List	body	Optional. The user tags.		4.8.0

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "672906b1aeca3a68a24c1b07a4f8deb5",

action.sessionId = "b86c9016b4f24953a9edefb53ca0678c";
GetVSwitchTypesAction.Result res = action.call();
```

Python SDK

```
GetVSwitchTypesAction action = GetVSwitchTypesAction()
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
GetVSwitchTypesAction.Result res = action.call()
```

5.3.3 L3 Network Operations

5.3.3.1 CreateL3Network

API Request

URLs

```
POST zstack/v1/l3-networks
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "name": "Test-L3Network",
    "type": "L3BasicNetwork",
    "l2NetworkUuid": "bb059728e72f3ff1b3ae2fc9caba3dce",
    "category": "Private",
    "system": false,
    "enableIPAM": true
  },
}
```

```
"systemTags": [],
"userTags": []
}
```

**Note:**

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"name":"Test-
L3Network","type":"L3BasicNetwork","l2NetworkUuid":"bb059728e72f3ff1b3ae2fc9caba3
\
http://localhost:8080/zstack/v1/l3-networks
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
name	String	body (contained in the params structure)	The L3 network name.		0.6
description	String	body (contained in the params structure)	Optional. The detailed description of the L3 network.		0.6
type	String	body (contained in the params structure)	Optional. The L3 network type.	- L3BasicNetwork - L3VpcNetwork	0.6
l2NetworkUuid	String	body (contained in the params structure)	The L2 network UUID.		0.6
ipVersion	String	body (contained in the params structure)	Optional. The IP version.	4 6	4.6.21

Name	Type	Location	Description	Optional Value	Starting Version
system	boolean	body (contained in the params structure)	Optional. Whether the L3 network can be applied to appliance VM instances.		0.6
dnsDomain	String	body (contained in the params structure)	Optional. The DNS domain.		0.6
resourceUuid	String	body (contained in the params structure)	Optional. The resource UUID. If specified, the L3 network will use the specified value as UUID.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6
category	String	body (contained in the params structure)	Optional. The network type, which must be used with the system tags. If system is set to false, this parameter can be set to Public or Private.	• Public • Private • System	2.2
tagUuids	List	body (contained in the params structure)	The tag UUID list.		4.6.21

Name	Type	Location	Description	Optional Value	Starting Version
enableIPAM	Boolean	body(contained in the params structure)	Whether to enable the IP address management.		4.6.21

**Note:**

- When you create an L3 network in ZStack Cloud, you can specify the port mirroring network by adding the **mirrorNetwork** option to **SystemTags**.
 - Format of the **mirrorNetwork** option: `mirrorNetwork:: {L3NetworkV0Uuid}`
 - Example: `mirrorNetwork::1c707a63817b4f29b1235fa1f76c0ccc`

action.l2NetworkUuid = "bb059728e72f3ff1b3ae2fc9caba3dce"
action.category = "Private"
action.system = false
action.enableIPAM = true
action.sessionId = "b86c9016b4f24953a9edefb53ca0678c"
CreateL3NetworkAction.Result res = action.call()
```

5.3.3.2 DeleteL3Network

API Request

URLs

```
DELETE zstack/v1/l3-networks/{uuid}?deleteMode={deleteMode}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 9e78fa4cfc8a49baadb763cd62ac6a3f" \
-X DELETE http://localhost:8080/zstack/v1/l3-
networks/76490f9cd26d4c8a9501cc5a5312aa99?deleteMode=Permissive
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
deleteMode	String	body	Optional. The delete mode.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

When the API succeeded, an empty JSON structure {} is returned. When the API failed, the returned JSON structure includes an error field. For example,

```
{
  "error": {
    "code": "SYS.1001",
    "description": "A message or a operation timeout",
    "details": "Create VM on KVM timeout after 300s"
  }
}
```

SDK Sample

Java SDK

```
DeleteL3NetworkAction action = new DeleteL3NetworkAction();
action.uuid = "c19ee03770c6486b85abc58ea10f017a";
action.deleteMode = "Permissive";
action.sessionId = "b8b93037f8064e219bdcbe9dd9a9f366";
DeleteL3NetworkAction.Result res = action.call();
```

Python SDK

```
DeleteL3NetworkAction action = DeleteL3NetworkAction()
action.uuid = "8c4a39676be64072b20e7b7dc4b0ccc7"
action.deleteMode = "Permissive"
action.sessionId = "e0e4140009fc4b95af7197bffc64f7c0"
DeleteL3NetworkAction.Result res = action.call()
```

5.3.3.3 QueryL3Network

API Request

URLs

```
GET zstack/v1/l3-networks
GET zstack/v1/l3-networks/{uuid}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 98858a4b613f46a4815c34c1c930b34e" \
-X GET http://localhost:8080/zstack/v1/l3-networks
```

Note:

For example, query the private L3 network.

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 98858a4b613f46a4815c34c1c930b34e" \
-X GET http://localhost:8080/zstack/v1/l3-networks?q=category=Private
```

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth c1148725103644bc8e2879d72fa47389" \
-X GET http://localhost:8080/zstack/v1/l3-networks/9d119c003bb54d4781443bbc7febcd7f
```

Queryable Fields

You can check all queryable fields and resource names that can be queried across tables by using `zstack-cli`, entering `QueryL3Network`, and pressing the **Tab** key.

API Response

Sample Response

```
{
  "inventories": [
    {
      "name": "Test-L3Network",
      "l2NetworkUuid": "8bcf5b824378406494d81ffdae56bde3"
    }
  ]
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventories	List	See inventories .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6

Name	Type	Description	Starting Version
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

#inventories

Name	Type	Description	Starting Version
uuid	String	The resource UUID.	0.6
name	String	The resource name.	0.6
description	String	The detailed description of the resource.	0.6
type	String	The L3 network type.	0.6
zoneUuid	String	The zone UUID.	0.6
l2NetworkUuid	String	The L2 network UUID.	0.6
state	String	The state of the L3 network.	0.6
dnsDomain	String	The DNS domain.	0.6
system	Boolean	Whether the L3 network can be applied to appliance VM instances.	0.6
category	String	The network type, which must be used with the system tags. If system is set to	0.6

Name	Type	Description	Starting Version
		true, this parameter can be set to Public or Private.	
ipVersion	Integer	The IP version.	3.1.0
createDate	Timestamp	The creation date.	0.6
lastOpDate	Timestamp	The last operation date.	0.6

SDK Sample

Java SDK

```
QueryL3NetworkAction action = new QueryL3NetworkAction();
action.conditions = asList();
action.sessionId = "58f4bcc9b20f46bfaba379ca0c739535";
QueryL3NetworkAction.Result res = action.call();
```

Python SDK

```
QueryL3NetworkAction action = QueryL3NetworkAction()
action.conditions = []
action.sessionId = "2f99e245b0f04712941da401ecab7173"
```

```
QueryL3NetworkAction.Result res = action.call()
```

5.3.3.4 UpdateL3Network

API Request

URLs

```
PUT zstack/v1/l3-networks/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "updateL3Network": {
    "name": "Test-L3Network"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"updateL3Network":{"name":"Test-L3Network"}}' \
http://localhost:8080/zstack/v1/l3-networks/
a1a3a4bea5e73628b591081fde9f019a/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6
name	String	body (contained in the updateL3Ne	Optional. The L3 network name.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
		work structure)			
description	String	body (contained in the updateL3Network structure)	Optional. The detailed description of the L3 network .		0.6
system	Boolean	body (contained in the updateL3Network structure)	Optional. Whether the L3 network can be applied to appliance VM instances.		0.6
dnsDomain	String	body (contained in the updateL3Network structure)	Optional. The DNS domain.		2.6.0
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6
category	String	body (contained in the updateL3Network structure)	Optional. The network type, which must be used with the system tags. If system is set to true, this parameter can be set to Public or Private.	• Public • Private • System	2.2

API Response

Sample Response

```
{
  "inventory": {
    "uuid": "dd370da0d6fa49288fc119b35db36b7c",
    "name": "Test-L3Network"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6
inventory	L3NetworkInventory	See inventory .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6

SDK Sample

Java SDK

```
UpdateL3NetworkAction action = new UpdateL3NetworkAction();
action.uuid = "88d2a1d687974c0ea0e102c276739e39";
```

```
action.name = "Test-L3Network";  
action.sessionId = "dae0914beced4293bd336fe443ed0d2b";  
UpdateL3NetworkAction.Result res = action.call();
```

Python SDK

```
UpdateL3NetworkAction action = UpdateL3NetworkAction()  
action.uuid = "3210b12187464e35bfdc50d8d4e2d1d0"  
action.name = "Test-L3Network"  
action.sessionId = "9e0b1d4240ef4421804612b01c98d7b8"  
UpdateL3NetworkAction.Result res = action.call()
```

5.3.3.5 GetL3NetworkTypes

API Request

URLs

```
GET zstack/v1/l3-networks/types
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \  
-H "Authorization: OAuth 3a142b201e9342abbb5864a0ea48992e" \  
-X GET http://localhost:8080/zstack/v1/l3-networks/types
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
systemTags	List	query	Optional. The system tags.		0.6
userTags	List	query	Optional. The user tags.		0.6

API Response

Sample Response

```
{  
  "l3NetworkTypes": [  
    "L3BasicNetwork"  
  ]  
}
```

}

Name	Type	Description	Starting Version
types	List		0.6
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6

#error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6
details	String	The details about the error.	0.6

opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

SDK Sample

Java SDK

```
GetL3NetworkTypesAction action = new GetL3NetworkTypesAction();
action.sessionId = "9105437ebb27461fbae36ecb93336ceba";
```

```
GetL3NetworkTypesAction.Result res = action.call();
```

Python SDK

```
GetL3NetworkTypesAction action = GetL3NetworkTypesAction()
action.sessionId = "a69bae9c3cad4209b042956b23c70af7"
GetL3NetworkTypesAction.Result res = action.call()
```

5.3.3.6 ChangeL3NetworkState

API Request

URLs

```
PUT zstack/v1/l3-networks/{uuid}/actions
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "changeL3NetworkState": {
    "stateEvent": "enable"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X PUT -d '{"changeL3NetworkState":{"stateEvent":"enable"}}' \
http://localhost:8080/zstack/v1/l3-networks/
a8744f1ba60c33f3a2c912c077f41fe5/actions
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
uuid	String	url	The resource UUID.		0.6

Name	Type	Location	Description	Optional Value	Starting Version
stateEvent	String	body (contained in the changeL3NetworkState structure)	The state. Options: enable and disable .	- enable - disable	0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {
    "name": "Test-L3Network",
    "l2NetworkUuid": "dfae4bce43694f4d9fc0ba5cdf4e38bd"
  }
}
```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6

lastOpDate	Timestamp	The last operation date.	2.3

SDK Sample

Java SDK

```
ChangeL3NetworkStateAction action = new ChangeL3NetworkStateAction();
action.uuid = "eb0849bf0e57400da650a09f2e852260";
action.stateEvent = "enable";
action.sessionId = "be8ec965ebd94169ba713c42dc079af9";
ChangeL3NetworkStateAction.Result res = action.call();
```

Python SDK

```
ChangeL3NetworkStateAction action = ChangeL3NetworkStateAction()
action.uuid = "d8a1565df89748a2a21ef87b9c9f5be7"
action.stateEvent = "enable"
action.sessionId = "7b8417b9ee3b4df8a21acc8e7c41a7f9"
ChangeL3NetworkStateAction.Result res = action.call()
```

5.3.3.7 GetL3NetworkDhcpIpAddress

API Request

URLs

```
GET zstack/v1/l3-networks/{l3NetworkUuid}/dhcp-ip
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X GET http://localhost:8080/zstack/v1/l3-networks/82cae6542d3b3e7ea50dab8681f3785c/dhcp-ip
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
l3NetworkUuid	String	url	The L3 network UUID.		0.6
systemTags	List	query	Optional. The system tags.		0.6
userTags	List	query	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "ip": "192.168.100.3"
}
```

Name	Type	Description	Starting Version
ip	String	The IP address.	0.6
ip6	String	The IPv6 address.	3.10.0
success	boolean	Whether the API succeeds.	0.6
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6

error

Name	Type	Description	Starting Version
code	String	The error code, which is a numbered or alphanumeric code that specifies an error. For example, SYS.1000, HOST.1001.	0.6
description	String	The brief description of the error.	0.6

Name	Type	Description	Starting Version
details	String	The details about the error.	0.6
elaboration	String	The reserved field. Default value: null.	0.6
opaque	LinkedHashMap	The reserved field. Default value: null.	0.6
cause	ErrorCode	The root error, which is the associated root cause of the current error. If no root error exists, this parameter is null.	0.6

SDK Sample

Java SDK

```
GetL3NetworkDhcpIpAddressAction action = new GetL3NetworkDhcpIpAddressAction();
action.l3NetworkUuid = "1c311c313859434f8586d4288a31952e";
action.sessionId = "dd1a8993de0e41e18d8718ea2e2d8259";
GetL3NetworkDhcpIpAddressAction.Result res = action.call();
```

Python SDK

```
GetL3NetworkDhcpIpAddressAction action = GetL3NetworkDhcpIpAddressAction();
action.l3NetworkUuid = "4970a85c53a24e35a55f44830058e719"
action.sessionId = "50fd78e250d94c5d944a5fa1a5d6bde0"
GetL3NetworkDhcpIpAddressAction.Result res = action.call()
```

5.3.3.8 AddDnsToL3Network

API Request

URLs

```
POST zstack/v1/l3-networks/{l3NetworkUuid}/dns
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
```

```

"params": {
  "dns": "8.8.8.8"
},
"systemTags": [],
"userTags": []
}

```

Curl Sample

```

curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":{"dns":"8.8.8.8"}}' \
http://localhost:8080/zstack/v1/l3-
networks/0b8da8c298ed3960925abbcc4f913da8/dns

```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
l3NetworkUuid	String	url	The L3 network UUID.		0.6
dns	String	url	The DNS address.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```

{
  "inventory": {
    "name": "Test-L3Network",
    "l2NetworkUuid": "08f7b0b577a84c28968ddce5a9377c5d",
    "dns": [
      "8.8.8.8"
    ]
  }
}

```

Name	Type	Description	Starting Version
error	ErrorCode	The error code. If not null, the operation fails, or vice versa. For more information, see error .	0.6

SDK Sample

Java SDK

```
AddDnsToL3NetworkAction action = new AddDnsToL3NetworkAction();
action.l3NetworkUuid = "80bfa9b9c4534a2593fcda534ee6414f";
action.dns = "8.8.8.8";
action.sessionId = "0a24af3791134b81bba960844b3aa899";
AddDnsToL3NetworkAction.Result res = action.call();
```

Python SDK

```
AddDnsToL3NetworkAction action = AddDnsToL3NetworkAction()
action.l3NetworkUuid = "17ecd7a47dc34f1ba01df5180480e264"
action.dns = "8.8.8.8"
action.sessionId = "30e00bf1296244cd98c93dec6182ab72"
```

```
AddDnsToL3NetworkAction.Result res = action.call()
```

5.3.3.9 RemoveDnsFromL3Network

API Request

URLs

```
DELETE/v1/l3-networks/{l3NetworkUuid}/dns/{dns}
```

Headers

```
Authorization: OAuth the-session-uuid
```

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth 209fa412351946a6bef267d423f4e53c" \
-X DELETE http://localhost:8080/zstack/v1/l3-networks/
d96f7d4c0506435a9a1aa7394976c0b2/dns/8.8.4.4?
```

Request Parameters

Name	Type	Location	Description	Optional Value	Starting Version
l3NetworkUuid	String	url	The L3 network UUID.		0.6
dns	String	url	The DNS address.		0.6
systemTags	List	body	Optional. The system tags.		0.6
userTags	List	body	Optional. The user tags.		0.6

API Response

Sample Response

```
{
  "inventory": {
    "name": "Test-L3Network",
    "l2NetworkUuid": "535aea9c1be24fb9b172fa1955341685",
    "dns": []
  }
}
```

}

Name	Type	Description	Starting Version

```

5.3.3.10 AddHostRouteToL3Network

API Request

URLs

```
POST zstack/v1/l3-networks/{l3NetworkUuid}/hostroute
```

Headers

```
Authorization: OAuth the-session-uuid
```

Body

```
{
  "params": {
    "prefix": "169.254.169.254/32",
    "nexthop": "192.168.1.254"
  },
  "systemTags": [],
  "userTags": []
}
```

Note:

In the preceding sample, both **systemTags** and **userTags** are optional. These two fields can be included in the body structure.

Curl Sample

```
curl -H "Content-Type: application/json;charset=UTF-8" \
-H "Authorization: OAuth b86c9016b4f24953a9edefb53ca0678c" \
-X POST -d '{"params":
